PREFACE.

The record of the year 1899 is an unusually full one. In the United States the development of trade, industry, and agriculture marks it as one of the most prosperous years in our history, and our political record has an especial interest from the new issues that have presented themselves in connection with our colonial policy. In international and foreign affairs the topics that have come up for treatment are numerous and varied. Besides the war in the Transvaal, the list comprises The Hague Conference, the Alaska Boundary Dispute, the settlement of the Fashoda affair, the new international status of Japan, the Anglo-Russian agreement respecting China, and the new turn in the Dreyfus affair. The discussion of scientific topics has been unusually interesting. Important discoveries have been made in the departments of Archæology, Medicine, Anthropology, Experimental Psychology, Engineering, Geology, Chemistry, Botany, and Physics. New men have come forward, and men already well known have added to their records, necessitating the inclusion of an unusually large number of biographical articles. Biographies of the living include such names as Roberts, Buller, Rhodes, and Kruger, while on the death list are Lawton, Joubert, Coues, Moody, Ingersoll, Dingley, and many others. The new books and new plays requiring mention fill many pages. Important experiments have been made in municipal government. In short, the abundance of material has made the problem of condensation exceedingly difficult, especially as the YEAR BOOK aims to be something more than a bare record of facts or compilation of statistics, its object being to discuss as well the debated questions of the year, with a view to exhibiting fairly the opposing views. The essential features of the original plan have been retained. The work being designed to supplement or continue the principal cyclopædias,

and at the same time to serve independently as an annual work of reference, the single alphabetical arrangement has been adopted, and the topics have generally been placed under their own heads rather than grouped under titles which could be ascertained only by reference to the table of contents. This seemed best suited to the double office which the book was intended to fulfil—namely, that of a year book and of a cyclopædia appendix.

Frank Moore Colby.

THE INTERNATIONAL YEAR BOOK 1899

ABRASIVES. The value of the abrasive products in the United States, both domestic and imported, in 1898, was as follows:

Name.	Domestic.	Imported.
Buhrstones	\$ 25,934	\$ 22,974
Corundum and emery.....	275,064	133,399
Garnet	86,850	
Grindstones	489,769	62,973
Pulp stone.....	10,619	
Infusorial earth.....	16,619	
Oilstones and whetstones.....	180,486	30,856
Pumice-stone	13,200	
Quartz crystals.....	23,990	
Carborundum	150,000	

The use of buhrstone for millstones for flour-mills has practically ceased.

Some interesting investigations of shell engravings have been made by Dr. F. H. Cushing, of the Bureau of American Ethnology, who finds that the North American Indians employed tools consisting of garnet points attached to a wooden handle.

The increase in the supply of pumice-stone from Nebraska and Utah is gratifying, as hitherto our supply has been entirely derived from Italy.

ABYSSINIA, an African empire lying in the extreme east of the continent, near the Red Sea, from which it is cut off by the Italian territory of Eritrea.

Area and Population.—The area of Abyssinia is about 150,000 square miles, including its dependencies, and its population is estimated at 3,500,000. Great Britain acquired about 8000 square miles of the territory known as British Somaliland by a treaty in 1898, and Italy possesses a strip of land on the coast about 180 miles broad. Abyssinia comprises the provinces of Tigré on the north, Amhara on the south, and Shoa on the southeast, in addition to certain ill-defined dependencies and parts of the Galla and Somali territories. It is made up of high table-lands ranging from 6000 to 10,000 feet above sea level, and broken by chains of mountains and river gorges. The highlands rise abruptly from the low-lying territory along the seacoast, and form a sort of natural fortress which has aided the country in preserving its independence in the past. Of the numerous towns, most of which are of small size, the most important are Gondar, the capital of Amhara; Adua or Adowa, the capital of Tigré; Adis Abeba, the capital of Shoa, and Ankober, the former capital of Shoa.

Racial Characteristics, Religion and Education.—The natives have little in common with the natives of other parts of Africa. They have good physique, with great power of endurance, and are said to make excellent soldiers. Education is not very advanced, and is in the hands of the clergy. The subjects taught are very restricted in their scope. The Abyssinians are still members of the Alexandrian Church, being one of the oldest bodies of Christians in the world. The head of the church, or Abuna, is a Copt, who is consecrated by the Patriarch of Alexandria, but is under the supremacy of a native prelate known as the Echegeheh, and

does not maintain any connection with Egypt, since on leaving that country he is required to take an oath that he will never return.

Production.—It is impossible to procure exact statistics concerning the production and commerce of Abyssinia, but the following facts taken from the United States Consular Reports of August, 1899, may be of interest. The extraordinary fertility of the soil is established beyond question by the reports of recent travelers, and yet large tracts of land lie waste, since the natives of these portions of the country cultivate no more than enough to supply their own wants. It is said that seven-tenths of the uncultivated lands from Harar to the southern boundary of Abyssinia are well adapted to the cultivation of coffee. Cotton is also capable of being produced on a much larger scale than at present, and the native product is of excellent quality. Conditions are favorable for cattle-breeding, and the climate, with its regular rainy season and its variegated surface, makes it possible to raise all kinds of products, including those of both the temperate and tropical zones. The native horses and mules are remarkable for their strength and endurance. Tobacco, olives, and figs grow wild. Honey is produced in great quantities, and is used to make the national drink, known as *tech*, as well as a kind of brandy. Among the other products are hides and skins, eggs, barley, millet, hops, civet, coffee, wax, and ivory. A comparatively small portion of the land is devoted to agriculture, the greater part of the cultivable area being used for pasture.

Commerce.—The latest figures published in 1899 related to the commerce for 1897-98, and applied only to the city of Harar, but this city being the great commercial centre of the country, and including by far the greatest part of the commercial transactions, its figures give a fair idea of the trade conditions of the country. The chief articles of import in 1897-98 were, in the order of their importance, cotton cloths, arms and military stores, glassware and beads, woollen goods and rugs, food products, and silks. Their aggregate value was \$2,427,265, of which \$1,133,296 represented the value of cotton cloths. The source of these imports was mainly Germany, England, and Austria. They came by way of Bombay and Aden. Of the imports entering the country by the latter route American cottons made up a large part, and it is said that the demand for these goods is rapidly increasing. Germany supplies the greater part of the woollen goods, but rugs are imported from the East and from England and Austria. France, Germany, and Switzerland supply the silks. There is a large sale of arms and munitions, the Gras gun being the favorite, and selling at the rate of from 100,000 to 150,000 a year. The total value of the exports for 1897-98 was \$1,126,155, and the chief item on the list was coffee, which was valued at \$463,200. Next in importance among the exports were gold, ivory, hides, and civet. Of the two grades of coffee sold at Harar one has a small grain like Mocha and the other has a longer berry and is better cultivated. The latter is sold to some extent in England and America. Most of the ivory is paid as tribute to King Menelek, who pays it out, together with gold, for his purchases of arms. Gold is exported in the form of rings and small ingots. The exportation of hides has decreased since 1890 on account of the prevalence of cattle diseases. As to the government's policy in respect to foreign trade, duties are imposed on both exports and imports of merchandise.

Form of Government.—Abyssinia is under a sort of feudal *régime* in which the supreme ruler is King Menelek II., who came to the throne in 1889. The feudal nature of his rule appears in his relations to certain vassal princes. In his relation with his subjects he is essentially an absolute monarch. There is a standing army consisting of about 150,000 men, which is recruited from the various provinces. Besides this there are irregular troops and a territorial army.

History.—Rumors were repeatedly circulated that Menelek was on the point of attacking the English power in Africa. In 1898 one of these rumors had it that Menelek was preparing to aid Major Marchand at Fashoda, and in 1899 that he was about to take advantage of the war in the Transvaal by hostile operations in the Soudan. These reports appear to have come from Italy, where a certain group of politicians had long desired to arouse hostility between England and France, and to this end circulated alarmist rumors in regard to the state of affairs in eastern Africa. These reports caused some anxiety, but appeared to rest on no sound foundation. In 1899 some geographical expeditions were in progress in Abyssinia and in the adjoining territory. One of these was that of the French explorer Lieutenant Blondiaux, whose expedition was officially pronounced to be purely geographical. He had been sent to Raheita, which lies on the west coast of the Red Sea, between the Italian colony of Eritrea and the French colony on the coast of Somaliland. His object was to define the frontier between the French and Italian territories. The matter was settled amicably, Italy obtaining the coast as far as Cape Duneifa and France the portion south of that point. A small island near the cape verging toward the south seemed geographically and politically to belong to France. In England the affair seemed to some writers to indicate an

intention on the part of France to build a fort near the entrance to the Straits of Babel-Mandeb, and thus to threaten the neighboring British colony of Perim. There was no proof, however, of any such desire on the part of France. French writers denied any ambitions other than commercial and scientific in this region, and declared that the danger to neighboring territories was not threatened by the policy of France, but rather by that of England. The latter's policy was said by some to menace the integrity of Menelek's empire. English explorers and agents of the intelligence department of the British army of occupation had begun minute investigations on the frontiers of Abyssinia in order to report upon the routes, means of subsistence, nature of the population, and the quantity and value of the arms in this region. In France this course was regarded with suspicion and as indicating a purpose to place the British flag at Adis Abeba.

ACADÉMIE DE MÉDECINE, a French medical society, founded in 1820, has 77 members, and publishes a *Bulletin* and *Memoires*.

ACADÉMIE DES BEAUX ARTS. See INSTITUTE OF FRANCE.

ACADÉMIE DES INSCRIPTIONS ET BELLES-LETTRES. See INSTITUTE OF FRANCE.

ACADÉMIE DES SCIENCES. See INSTITUTE OF FRANCE.

ACADÉMIE DES SCIENCES, MORALES ET POLITIQUES. See INSTITUTE OF FRANCE.

ACADÉMIE FRANÇAISE (French Academy), founded in 1629, by Cardinal Richelieu, consists of 40 members (the "forty immortals") and meets at the Palais de l'Institut every Thursday. The members now, with the dates of their election, are: Legouvé, 1855; Duc de Broglie, 1862; Emile Ollivier, 1870; Alfred Mézières, 1874; Gaston Boissier, 1876; V. Sardou, 1877; Duc d'Audiffert Pasquier, 1878; Rousse, 1880; Sully-Prudhomme, 1881; Perraud, 1882; E. Pailleron, 1882; F. Coppée, 1884; Joseph Bertrand, 1884; Halévy, 1884; V. Gérard, 1886; Comte d'Haussonville, 1886; Jules Claretie, 1888; Melchior de Vogüé, 1888; De Freycinet, 1890; J. Viaud (Pierre Loti), 1891; E. Lavisse, 1892; Dangein, 1893; H. de Bornier, 1893; Brunetiere, 1893; A. Sorel, 1894; Paul Bourget, 1894; De Hérédia, 1894; H. Hous-saye, 1895; J. Lemaître, 1895; Anatole France, 1896; Marquis Costa de Beauregard, 1896; Gaston Paris, 1896; Theuriet, 1896; Vandal, 1896; Hanotaux, 1897; De Mun, 1897; E. Guillaume, 1898; Lavedan, 1899; Deschanel, 1899. MM. Cherbuliez and Hervé died in 1899. The fortieth chair was vacant in 1899. Secretary, Gaston Boissier.

Twenty-one "*prix littéraires*" and forty "*prix de vertu*" are awarded by the academy annually. Six members are appointed as a Dictionary Commission.

ACADEMY OF MEDICINE, AMERICAN, is a society formed for the purpose of investigating the sociological problems of the medical profession and for putting in practice the results of its investigations. Its researches are strictly scientific. It has 874 members and 20 honorary members. Officers: President, G. Hudson Makuen, M.D., Philadelphia, Penn.; secretary, Charles McIntire, M.D., Easton, Penn.

ACADEMY OF POLITICAL AND SOCIAL SCIENCE, AMERICAN. See POLITICAL AND SOCIAL SCIENCE, AMERICAN ACADEMY OF.

ACADEMY OF SCIENCES (LISBON), founded in 1775, has sections devoted to mathematics, physics, natural history, literature, ethics, politics, history and archæology, each section having five active besides corresponding members. The Academy has a large library and publishes *Jornal de Sciencias*, etc., and *Memorias*.

ACADEMY OF SCIENCES (MUNICH, KÖNIGLICHE BAYRISCHE AKADEMIE DER WISSENSCHAFTEN UND GENERALKONSERVATORIUM) was founded in 1759, and has three sections—one devoted to philosophy and philology, another to mathematics and physics, the third to history; publishes *Denkschriften* and *Abhandlungen*.

ACETYLENE. See GAS, etc., and CALCIUM CARBIDE.

ACHENBACH, HEINRICH VON, Prussian statesman, died July 10, 1899. He was born at Saarbrücken November 23, 1829; he studied law in Bonn and Berlin, and in 1858 was appointed a lecturer on German law in Bonn, and in 1860 was made professor. In the same year he founded the *Zeitschrift für Bergrecht*, a journal on mining and mining laws, which he conducted for fourteen years. Meanwhile, he entered politics, was a member of the Superior Council of Mines, and was appointed in 1866 mining councillor in the Ministry of Commerce. In 1870 he was appointed to the Federal Chancery. In 1872 he was called by Falk, the minister of ecclesiastical affairs, to be under secretary of state, and while in this position he bore a prominent part in the struggle which took place in the *Landtag* between church and state. In May, 1873, he became minister of commerce, industry, and

public works, and in the following year took charge also of the Department of Agriculture. Achenbach was active in railroad discussion, and largely through his influence the *Reichstag* made appropriations for the purchase of the German railroads. In 1874 he became Prussian representative in the Imperial Federal Council. He was appointed in March, 1878, to the governorship of the province of West Prussia, and in February, 1879, became governor of Brandenburg; he retained the latter position to the time of his death. In 1888 he was raised to the nobility. Besides several works on the history of the principality of Siegen, Achenbach wrote a few volumes on jurisprudence, including *Das französische Bergrecht und die Fortbildung desselben durch das preussische allgemeine Bergesetz* (1869) and *Das gemeine deutsche Bergrecht* (1871).

ACOIN. This new local anæsthetic is a derivative of guanin, and appears as a white powder soluble in water in the proportion of $4\frac{1}{2}$ grains to the ounce. Guanin occurs in the form of a white powder or a crystalline substance, and is obtained from guano, from the scales of certain fishes, from the excrement of spiders, and is occasionally found in the human liver, pancreas, and spleen. Acoin is distinctly less toxic than cocaine, and does not act as quickly. Randolph has used it during the year 1899 in various operations on the eye. He has published in the *Ophthalmic Record* the following conclusions: 1. Acoin in solutions of 1:100 and 1:300 produces satisfactory anæsthesia in an unirritated eye in about the same length of time as cocaine. 2. In more than one case where the eye was congested repeated instillations of acoin were inadequate to produce anæsthesia. 3. Inspection of the cornea with high-power lens failed to show any defects in the epithelium after its use. 4. Acoin has no effect on accommodation. 5. Acoin does not increase intraocular tension. 6. Several experiments indicated that acoin was not only an inhibitor of the growth of staphylococcus albus, but that it also killed this organism after a certain length of time.

ACTORS FUND OF AMERICA, a charitable institution formed in 1882. Disbursements last fiscal year, \$32,772; since organization, \$610,986. In 1899 there were 755 members. President, Louis Aldrich; Secretary, Edwin Knowles; Assistant Secretary, B. A. Reinhold, 12 West Twenty-eighth Street, New York City.

ACTUARIAL SOCIETY OF AMERICA, organized in 1889 for the promotion of the science of life insurance, held its decennial meeting May 18, 1899. During the ten years twenty meetings were held, twenty numbers of *Papers and Transactions* were published, a library of considerable size was accumulated, and the membership, notwithstanding the losses, steadily increased. Present membership, 112. President, Thomas B. Macaulay; Secretary, John Tatlock, Jr., 141 Broadway, New York.

ADAMS, Colonel JULIUS WALKER, died December 13, 1899, at the age of 87 years. As a civil engineer he was identified with the origin and construction of the New York and Brooklyn suspension bridge, having been one of the first engineers who conceived the idea of building it, and having held various positions in connection with the early part of its construction. His scientific knowledge was acquired at West Point, which institution he left to become the assistant engineer of the Providence and Stonington Railroad. He was the chief engineer in the building of several bridges and railroads, and was consulting engineer, at different times, to the Wallabout Commission and to the Brooklyn Board of City Works, and in connection with water distribution in New York City. He served also as consulting or chief engineer on government and army constructions. As colonel, he commanded the Hawkins Zouaves in the Civil War; during the New York riot he commanded the troops at Printing House Square.

ADEN, a territory in southwestern Arabia, about 110 miles east of the Straits of Babel-Mandeb. It comprises, besides the volcanic peninsula of Aden proper, a smaller peninsula known as Little Aden, and a town and three small villages on the mainland, together with the adjacent island of Perim. The area, including Perim, is 80 square miles, and the population in 1891 was 41,910. The town of Aden is well fortified and has a fine harbor. It is an important coaling station on the route to the East. The territory is a dependency of Great Britain, and under the government of Bombay. It is directly administered by a political resident who is both military and civil governor. Its chief importance is commercial. Among its articles of trade are coffee, gums, hides and skins, piece goods, tobacco, and cotton twist. It serves as a collecting point of exports from Somaliland and part of Abyssinia, and as the distributing centre for articles imported to that region. It is the place of transshipment for goods destined for steamship transit to Zeila and Berbera, from which points they are carried into the interior of Africa by camels. It was reported in 1899 that the entire import trade by sea during the year was \$11,722,223, of which cotton goods was the most important part.

ADULTERATION. See **FOODS.**

ADVANCEMENT OF SCIENCE, AMERICAN ASSOCIATION FOR THE, organized in 1848, had in 1899 a membership of 1725. President, Grove K. Gilbert; permanent secretary, L. O. Howard, Cosmos Club, Washington, D. C. General meeting for 1900 in New York, June 23-30. The association publishes annual *Proceedings*.

ADVENTISTS. The name of six religious sects, specifically distinguished as follows: (1) The Evangelical, with (in 1899) 34 ministers, 30 churches, and 1147 communicants; (2) the Advent Christians, with 912 ministers, 610 churches, and 26,500 communicants; (3) the Seventh-Day Adventists (see below); (4) the Church of God, with 19 ministers, 29 churches, and 647 members; (5) the Life and Advent Union, with 60 ministers, 33 churches, and 3000 communicants, and (6) the Churches of God in Jesus Christ, with 94 ministers, 95 churches, and 2872 communicants.

ADVENTISTS, SEVENTH-DAY. organized about 1844, held in 1899 a biennial conference at South Lancaster, Mass., delegates attending from many countries in all parts of the world, and a conference of the Australasian Union was held at Cooranbong, New South Wales. A conference was organized in the Province of Ontario in June, and includes 7 churches and about 500 members. In 1898-99 there was an increase of 110 ordained ministers, 23 licentiates, 215 churches, and 7245 members, and an increase of tithe of \$90,000; making in 1899 a total of 372 ministers, 1470 churches, and 55,316 members. The latest report of the Commissioner of Education (1899) shows the Seventh-Day Adventists to have 3 institutions of learning, with 31 professors and 223 students.

AÉRIAL NAVIGATION is now attempted with machines belonging to two systems. The one system, ballooning, requires apparatus lighter than the air; the other, aviation, or an imitation of bird motion, necessarily uses machines heavier than the air. The greatest objection to the balloon is the difficulty, not to say impossibility, of steering it properly; while the great difficulty with a machine heavier than the air, of course, is keeping it afloat. It should be remarked that some of the more recent air-ships, such as the Zeppelin machine described below, make use both of gas expansion and of mechanical steering and propelling appliances.

A flying-machine, also combining the principle of the balloon with aviation, has been devised by Dr. Danilewsky, of Charkov, Russia, and with it, as early as the fall of 1897, several ascents, successful, though of short duration, were made. It attracted the attention of the United States government, which has appropriated \$25,000 for experiments relating thereto.

In September, 1898, an air-ship, invented by M. De Santos-Dumont, of Paris, and consisting of a cylindrical balloon and a basket with a steering apparatus and a two-bladed aluminium propeller operated by a motor, made a fairly successful ascent and journey in Paris. The balloon and basket weigh about 154 pounds, and the motor and screw about 176 pounds.

Early in 1899 it was announced that Mr. Hargrave, the kite-flying expert, had invented a "soaring apparatus based on his discovery that the cup-shape of the under side of a bird's wings causes an air vortex to form in flight and propel the bird against the wind in long-sustained soaring."

In September, 1899, a French aéronaut, M. Hermite, travelled in a balloon from St. Denis to the mouth of the Rhone in fifteen hours. The speed accordingly was as fast as an express train.

Also in the fall of 1899 a description was published of a flying-machine invented by M. Feodoroff, who claimed that his invention was thoroughly successful. The propelling power is derived from the combustion of gas, which is generated from liquids stored in reservoirs on the machine. There is said to be no danger of fire, since the car is separated by incombustible materials from the apparatus, which is built wholly of metal. The car is designed to hold one person, and the possible speed claimed for the machine is from 140 to 160 kilometres (87 to 99 miles) an hour.

The Zeppelin Air-Ship.—The most noteworthy attempt at aerial navigation in 1899 was the great dirigible balloon, devised by Count von Zeppelin, which was in process of construction during the year. The motive force, which is a benzine engine, was expected to drive the ship in calm weather at a rate of twenty-two miles an hour. Near the end of the year the cost had amounted to almost \$350,000. Still incomplete at the close of the year, it was housed in an immense floating structure on Lake Constance. The following description is a condensed translation from *Ueber Land und Meer*, appearing in the *Scientific American Supplement* for November 11, 1899:

"The air-ship now in the course of erection within this structure is 410 feet long.

The supporting body is a cylinder 39 feet in diameter, the ends being tapered so as to offer the least possible resistance to the air. The skeleton frame of this cylinder is composed of aluminium. Sixteen rings separated from one another 26 feet hold the framework together. These rings are not circular, but form a twenty-four-sided polygon; their shape is determined by numerous strong aluminium wires radiating from a central circle like the spokes of a bicycle wheel. Horizontal bars are used to hold the rings together. The entire framework will be surrounded by a netting of ramie-fibre cord, remarkable for its great toughness and tensile strength. Within the framework and on each side of the rings a similar netting will be disposed.

"The sixteen rings divide the cylinder into seventeen compartments, as it were, each of which will contain a balloon or gas-bag. If one of these seventeen independent balloons be injured, the others will remain intact and will still support the air-ship. The principle evidently resembles that of the water-tight compartments of a steamship. But the system is far safer than that employed in vessels, for no connecting doors or openings are used.

"The balloons are made of a light, but tough and impenetrable, cotton fabric covered with a gas-tight rubber composition. The aluminium framework is still further protected by an outer water-tight envelope which serves chiefly to protect the balloons from the direct rays of the sun and from rain. The ramie netting serves the purpose of separating the balloons from one another and from the outer envelope.

"The balloons will have a capacity of 351,150 cubic feet, and will be filled with hydrogen gas kept under pressure in cast-iron cylinders, each of which contains 175 cubic feet. Two thousand cylinders will, therefore, be required. The cylinders will be stored on a float which will be towed to the housing when the balloons are to be inflated."

"Every moving body, such as a ship or bicycle, can be steered. That it has hitherto been impossible to direct an air-ship is due partly to the form adopted in the construction, partly to insufficient motive power and inadequate steering appliances. Count von Zeppelin claims to have remedied all these faults. He will drive his air-ship backward or forward by four aluminium propellers, a pair of which will be mounted at each end of the cylindrical body, somewhat below the central axis. The ship will be steered by rudders placed at the front and rear ends.

"Rigidly connected with the balloon cylinder are two aluminium cars, each located beneath a pair of propellers. These cars are 21.32 feet long, 5.96 feet wide, 3.28 feet high, and taper from top to bottom. Beneath the bottom of each car are wheels provided with coiled springs which deaden the shock when the air-ship strikes the ground and set the wheels in motion. In each car is a benzine motor, developing from 12 to 15 indicated horse-power, by means of which the propellers are driven. The connection between the propellers and the motors consists of gearing and of driving-shafts passing through Mannesmann seamless steel tubes. Variations in the position of the framework can be compensated for by means of two movable joint couplings.

"Benzine is the most suitable motive power for aerial navigation. Electricity can not be used, for the necessary accumulators are far too heavy. Hydrocarbon vapors, to be sure, are highly inflammable, and their use in air-ships provided with gas-bags is therefore attended with much danger. But the benzine motors in the present instance have been so carefully constructed that there is no danger of fire. Moreover, the lower side of the balloon-cylinder immediately above the cars has been covered with fireproof material. The cars are connected by a passage two feet wide which rest on T-rails and which are tied together with aluminium wire. The crew of five men can thus pass from one car to the other. Beneath the cars and connecting passage a cable is loosely suspended, to which a sliding weight is secured. By adjusting the position of the weight the ends of the ship can be raised or lowered. When the weight is shifted to the rear, the forward end of the air-ship is raised, and the air pressing on the under surface, as in a kite, will force the vessel upward. When the weight is shifted to the front, the rear end is elevated, and the ship will descend owing to the pressure of the air on its upper surface.

"The first trials of the ship are soon to be made. The supporting cylindrical body is almost completed; and only the pointed ends are still to be placed in position. The cars, motors, propellers, and accessory apparatus will be shipped to the housing ready to be mounted, an operation which will require but a few days."

AFGHANISTAN lies in Central Asia to the south of the Central Asian states under Russian influence. Persia bounds it on the west and the British political agency of Baluchistan on the south. It has an area variously estimated at from 215,400 square miles to about 300,000 square miles and a population estimated at 4,000,000, though some authorities place it as high as 16,000,000. The boundaries on the east and south were long unsettled, but an agreement between England and

Afghanistan in 1893 fixed a basis upon which the delimitation of the frontier was subsequently carried out. As a result of this delimitation, Chitral, Swat, Bajaur, and Chilas were recognized by the Ameer as within the sphere of British influence. There were contested claims to Kafiristan and Waziristan, but these were settled by recognizing the former as under Afghan control and the latter as under British. The country is occupied by a variety of tribes, of which the most numerous are the Ghilzais, who number about 1,000,000. Other tribes are the Tajiks, Hazaras, Duranis, Aimaks, and Uzbeks. A large part of the population is nomadic, but the Tajiks practise agriculture and industry to some extent. The religion of most of the natives is Mohammedan, and they belong to the Suni sect. The chief products are horses, spices, asafœtida, fruits, and nuts, which are exported to India. The chief imports are cotton goods, indigo, sugar, and tea. The trade is mainly between Cabul, Candahar, and India, but of late years the trade between Cabul and India has considerably declined. While the exports consist chiefly of the products mentioned, the country produces wheat, barley, peas, beans, rice, millet, arzun, Indian corn, and a great variety of fruits. The latter are especially abundant and are the chief article of food for a large portion of the people. Copper veins are said to exist in the north of Afghanistan, and iron, gold, and precious stones in other parts of the country. The chief industries are the silk manufacture and the manufacture of felts, carpets, postins, and rosaries. The ruler or Ameer is Abdurrahman, who was recognized by the British Government in July, 1880. The regular army, which is based on European models, is said to number on a war footing about 50,000 men, and in addition to this there are local levies of infantry and cavalry. There is an arsenal at Cabul under the superintendence of Englishmen in the Ameer's service which manufactures cannon, rifles, and ammunition.

Afghan Question.—By the treaty of Paris, which closed the war with Persia, England declared that she regarded Afghanistan as the "outwork" of India, and as lying outside the sphere of Russian influence. The expansion of Russia in Central Asia has raised a serious question, since it has seemed likely that the assertion of Russian influence in Afghanistan would threaten England's political supremacy in India. As the result of an agreement, reached in 1893, a boundary commission delimited the Afghan frontier, but this has not been regarded as a final settlement of the difficulty, since Russia has at no time committed herself to non-interference with Afghanistan, although certain of her diplomats have expressed the opinion that Afghanistan was outside the sphere of Russian influence. England can cite no express declaration on the part of Russia that she would not invade Afghanistan, and there was nothing in the boundary agreement to make it unjustifiable for her to assert her influence beyond the frontier. Thus there has been no positive sign that Russia acquiesced in the English view that Afghanistan was not an independent country, but a dependency of India. In 1899 the two main objects of Russian policy in Central Asia were to secure a free port on the Persian Gulf, and to have an accredited Russian representative at Cabul, the capital of Afghanistan. As to the former request, it was generally supposed that England would offer no objection, provided counterbalancing advantages could be secured for her somewhere else. A free outlet to the ocean in western Asia seemed to be a reasonable demand on the part of Russia and to make for progress in that region. But it was clear that this desire of Russia's was not concerned solely with trade development, but had in view the securing of an important strategic point, and in England it was urged that should this be granted the English government should insist on keeping open Bushire as a free port and of reserving a portion of its "hinterland" as a British sphere. In other words, the granting of the demand was to be conditioned upon the obtaining of a fair equivalent. As to the second point, the maintenance of an accredited Russian representative at the Ameer's capital, some serious objections were advanced against it. It was said that upon the death of the present Ameer, Abdurrahman, who had proved himself able to inspire the respect and fear of his subjects, there would be no security for envoys at the Afghan capital. Again, it seemed likely that upon the death of the Ameer there would be a war of succession and that the maintenance of Afghan integrity would be a matter of extreme difficulty. For many years the British government, through the Viceroy of India, has paid an annual subsidy to the Ameer to aid him in maintaining his position and to reward him for conforming his foreign policy to the wishes of Great Britain. To give his country an international status would result in complicating the matter and would abandon the advantages for which England's money had been paid. Russia requested that Europe should be represented in the Afghan capital, and there were signs that the French sympathized in this desire. The Ameer himself was naturally favorable to such a change of status as would seem to place him on a par with the great European powers. It had long been a special object of his ambition to treat directly with London instead of through the Indian Viceroy. These subjects appear to have been discussed in diplomatic correspondence between

Russia and Great Britain in 1899, but there was no settlement of the questions involved down to the close of that year.

AFRICA has an area of nearly 12,000,000 square miles, some authorities placing it at 11,874,600 square miles, and others at 11,908,100 square miles. While several powers have long possessed portions of Africa, it is only within recent years that the territory has been extensively partitioned. It was not, in fact, until September, 1884, that the contest for African lands was actively begun. That was the year when Germany entered the competition and when the Berlin conference prescribed the rules which should govern the acquisition of African territory. At the present time the territory of Africa is divided among the following powers, either in the form of actual colonies or as dependencies and protectorates: France, Great Britain, Germany, Portugal, Italy, Spain, Turkey. Besides the possessions of these powers there are six independent States—namely, Morocco, Liberia, Abyssinia, the Orange Free State, the Transvaal Republic, and the Congo Free State, although the last named is administered by the Belgian King. The tie binding Egypt to Turkey is a loose one, and Egypt may be reckoned among the territories that are under British influence. The following list gives the names of the different divisions, classified according to the country which possesses them or exercises a controlling influence over them:

INDEPENDENT STATES.....	{	Abyssinia.
		Congo Free State.
		Liberia.
		Morocco.
		Orange Free State.
BRITISH.....	{	Tripoli.
		Ascension Island.
		Basutoland.
		Bechuanaland Protectorate.
		Cape Colony.
		Central Africa (British).
		Central Africa Protectorate (British).
		Mashonaland.
		Matabeleland.
		East Africa (British).
		Zanzibar.
		Mauritius.
		Natal.
		Niger Coast Protectorate.
		Niger Territories.
		St. Helena.
		Tristan da Cunha.
		Gold Coast.
		Lagos.
		Gambia.
UNDER BRITISH INFLUENCE.	{	Sierra Leone.
		Somali Coast Protectorate.
		Uganda.
		Walfisch Bay.
		Zululand.
		Egypt.
		The Egyptian Soudan.
		Transvaal.
		Algeria.
		French Congo.
FRENCH.....	{	French Guinea.
		Madagascar.

		German East Africa.
		German Southwest Africa.
		Togoland.

ITALIAN.....	{ Eritrea. Somaliland.
PORTUGUESE.....	{ Angola. Cape Verde Islands. Guinea. Portuguese East Africa.

The Partition of Africa.—According to the figures published by the Secretary of the Royal Geographical Society in 1898, the principal shares of European States in the lands of Africa were as follows:

France.....	3,300,000	square miles
Great Britain.....	2,300,000	" "
Germany.....	925,000	" "
Congo Free State (Belgium).....	900,000	" "
Portugal.....	750,000	" "
Italy (including Somaliland).....	420,000	" "

Figures based on more recent statistics and published by the United States Bureau of Statistics in 1899 give the following distribution of area:

Great Britain.....	2,761,195	square miles
France.....	3,027,420	" "
Germany.....	944,130	" "
Portugal.....	790,240	" "
Egypt and Soudan.....	1,350,000	" "
Tripoli.....	400,000	" "
Italy.....	188,500	" "
Spain.....	243,000	" "
Congo Free State.....	900,000	" "
Morocco.....	219,000	" "
Liberia.....	48,000	" "
Abyssinia.....	150,000	" "
Transvaal.....	119,139	" "
Orange Free State.....	48,326	" "

Population.—The estimates of population are very vague and range all the way from 125,000,000 to 175,000,000, but it may be safely stated that the population of Africa is about twice that of the United States. The population is marked by the great diversity of language and racial character, and this fact has retarded the opening up of the country to Europeans. The northern portion—that is, the territory lying north of latitude 10° north—is largely Mohammedan and hostile to Europeans. In parts of this region the slave trade has been followed, and the disorders which it has caused have proved another bar to the peaceful developments of the country. The chief races in the north may be divided into the three groups of Soudanese, consisting of negros, pure and mixed; Hamitic, comprising Berbers, Egyptians, and Ethiopians; and Semitic, comprising Arabs and Abyssinians. The negroes are divided into hundreds of linguistic groups and show little affinity to one another beyond rough external resemblance. In the south, where the Bantu language prevails, the population is more homogeneous, but here again the warlike character of many of the tribes has retarded European settlement. In physique the Bantu inhabitants of the south greatly surpass the races of Northern Africa, and have frequently proven their military power in contests with the Europeans and with one another.

Physical Features.—The extreme length of the continent is about 5000 miles and the breadth 4000. The coast is comparatively free from indentations, and there are few water routes into the interior. This has presented an obstacle to exploration, which has been increased by the fact that the interior consists in large part of high table-lands, and that the few rivers which derive their sources from the interior have rapids which obstruct navigation. The chief navigable rivers are the Congo, Niger, Senegal, and Gambia on the west; the Limpopo, Zambesi, Juba, and Umba on the southeast and east, and the Nile on the north. The Congo is navigable for a distance of about 2000 miles, but the rapids begin about 100 miles from the mouth, and in order to secure access to the long course of navigable waters in the interior, it is necessary to transport the steamers over the intervening distance. Small steamers are carried in sections from this point to the navigable waters, but the construction of a railway for a distance of 250 miles above the falls has permitted the transportation of larger vessels. As a result the Congo valley has developed rapidly, and instead of the few natural products that were formerly raised

there, coffee and cacao fields planted since 1891 yield valuable crops for the export trade. The Zambesi, which formerly could not be navigated on account of the shallow waters in the delta, has been opened up to navigation since 1887, and steamers penetrate about 600 miles inland, and the navigable distance is being increased by the construction of a railway around some of the rapids. The Niger, though navigable for a considerable distance from its mouth, is also interrupted by rapids, but the completion of certain railway projects now in hand will, it is said, open the river to navigation for a distance of about 1000 miles. The navigation of the Nile has been secured by the same method of constructing railways around the rapids, and now light-draught steamers penetrate into the heart of the continent, reaching a region not far distant from the navigable waters of the Congo. The other streams mentioned are navigable for a short distance from the coast. The lakes of the interior have already been opened to steam navigation. In addition to the difficulty of exploration caused by the comparatively small number of these water routes, inland travel has been impeded by the vast reaches of desert land in the north. This tract extends from the western coast to the region of the Upper Nile, and in the west is known as the Sahara, and in the east as the Libyan Desert. The desert land of the Sahara—that is, the portion of it which is unfit for grazing or for agriculture—has an estimated area of 2,400,000 square miles, and nearly one-fifth of this is covered by shifting sands. There are many difficulties in the way of travel through this region, especially in the central zone, which has a width of from 150 to 200 miles. The population of the Sahara is estimated at 100,000, and consists in the east chiefly of the Tuareg and Tibbu tribes, and in the west of Moors, Arabs, Berbers, and people of mixed negro race. The Soudan—that is, the region lying south of the Sahara, and extending from the Atlantic coast to the Red Sea and the Congo basin—has presented another obstacle to settlement in the frequent conflicts of its turbulent population. The Mohammedan slave dealers have been chiefly responsible for these conflicts. The chief element in the population is the negro.

The British Colonies in Africa.—Great Britain has her strongest hold in the southern and eastern parts of the continent. From Cape Town in the south to Lake Tanganyika—that is, for a distance of 1800 miles—her territory extends in an unbroken line, though narrowed here and there by the indentations of neighboring states. This territory is bounded on the west by German Southwest Africa, Portuguese Angola, and the Congo Free State, and on the east by Portuguese East Africa and German East Africa. The Orange Free State, which lies to the north of Cape Colony, is surrounded on three sides by British territory, and north of the Orange Free State is the other Boer republic, the Transvaal. At the beginning of 1899 the boundaries of the British territories in this region were all settled. They comprised an estimated area of 1,000,000 square miles, and in respect to their political status, ranged from well-established and self-governing colonies like Cape Colony to mere spheres of influence. If the "Cape to Cairo" railway is carried out, the line will not meet territory outside of British control until it has been completed to the southern end of Lake Tanganyika. Six hundred miles would then have to be passed before reaching British territory again, but two-thirds of this distance is taken up by Lake Tanganyika, whose waters are navigable to the states upon which it borders. This would leave only about two hundred miles of foreign territory to be traversed before the southern boundary of British East Africa was reached. From this point the British territory stretches continuously to the boundary of Egypt, which country itself is under British control. Beginning with the southernmost point, the British possessions which form the length of this almost unbroken chain stretching from Cape to Cairo are Cape Colony, British Bechuanaland, British South Africa, and British Central Africa; then comes the colony of German East Africa, north of which lies British East Africa. The southern part of this forms the dependent kingdom of Uganda, and the northwestern part extends to Bahr-el-Ghazal, which was the subject of dispute in 1898 and 1899, and to which France abandoned all claim by the Anglo-French convention of March 21, 1899. (See FRANCE.) To the north and east of this territory lie the other provinces of the Soudan regained for Egypt by the Kitchener expedition of 1898, and extending to the boundary of Egypt, which is under British influence. Besides this almost continuous tract, which is either in actual possession of Great Britain or under her control, the British possessions include the islands of Zanzibar and Pemba, together with a considerable tract on the eastern coast fronting on the Gulf of Aden, and commanding the entrance to the Red Sea. There is no such continuity of British territory on the western coast, where the chief British possession is the great block of land known as Nigeria, or the Niger territories, at the head of the Gulf of Guinea, and between the 5th and 15th degrees of north latitude. The boundaries of the Niger territories were defined by agreement with France and Germany, and with the native princes, the most recent dispute, that between

France and Germany, having been settled in August, 1898. The other British lands in this region are the district of Lagos and the Gold Coast, Sierra Leone and Gambia. The total population of the British possessions in Africa has recently been estimated at about 30,000,000, and, including Egypt, at about 50,000,000.

The French Possessions.—The area of the French territory in Africa surpasses that of any other power, but is inferior to the British possessions both in respect to natural resources and in respect to population. The greater part of the Sahara region was recognized as French by the agreement with England in 1890. In the north, on the coast of the Mediterranean, are her dependencies of Algeria and Tunis, to which her claims, established by right of conquest, seemed not to be disputed. South of these lies the enormous tract which stretches southeast as far as the western boundaries of the Egyptian provinces of the Soudan and the northern boundary of Nigeria, and west to the Atlantic Ocean. Passing along the western coast the French territory is indented by the independent principality of Morocco, the Spanish territory of Rio d'Oro, British Gambia, Portuguese Guinea, British Sierra Leone, the independent state of Liberia, the British Gold Coast, German Togoland, and British Nigeria. Another great division belonging to France is French Congo, which extends from the western coast of Africa and joins the French Sahara region in the interior, thus making French territory continuous from the southwest coast of Africa to the shore of the Mediterranean. Despite the large proportion of the French territory occupied by the Desert of Sahara, her possessions are most valuable. They include almost the entire length of the Senegal River, which is navigable for about 500 miles, and more than half the length of the Niger, the third largest river in the continent. It has been said that France cherished the ambition of carrying her territories eastward across the entire continent in spite of the claims of Great Britain on the Upper Nile. The Anglo-French agreement of March 21, 1899, arising out of the Fashoda dispute, put an end to this project, if it really existed. This convention determined the boundaries between the "hinterland" of the French Congo and the Egyptian provinces of the Soudan. On the eastern coast France possesses the important island of Madagascar, and a small wedge of territory called Obok, or Obock, opposite the British possession of Aden. The population of the territories possessed by France show great racial diversity. In the extreme north are the Moors and Berbers, and in the south a numerous population of the Negritos. The Moors and Berbers are Mohammedan in religion, and yield themselves slowly to civilization. The savage practices of the negritic tribes, together with the disorders arising from slave traffic, have absorbed the energies of the French and retarded commercial development. The French colonies, as a rule, have not reached the stage of peaceful settlement and economic development.

German Possessions.—Since the acquisition of Damaraland and Namaqualand on the southwestern coast, Germany has rapidly extended her African possessions. She now holds about 1,000,000 square miles, with an estimated population of 10,000,000. Her chief possessions are Togoland, Cameroon, German Southwest Africa, and German East Africa. The last named is her most valuable territory. It is bounded on the north by British East Africa, on the west by Congo Free State and British Central Africa, and on the south by Portuguese East Africa. Lying on the coast and having Lake Tanganyika on its western boundary, Lake Victoria Nyanza on its northern, and Lake Nyassa on the southwestern, it has access to water in any direction. While the German territories are rich in natural resources and show every variety of climate, they are still in a backward state. The European element in the population is very small, and commercial development is slow.

Portuguese Possessions.—Portugal, though the oldest sharer in African lands, has now only the large block of territory called Angola, on the west coast, the strip of land extending to the north and south of the Zambezi on the east coast, and the small colony of Portuguese Guinea on the western coast, lying to the north of French Guinea. Her eastern and western territories extend inland to a distance of about 600 miles from each other. Railway construction has made considerable progress, but in general the Portuguese have shown little enterprise in the development of their colonies.

The Congo Free State.—The Congo Free State lies in Equatorial Africa, and occupies the basin of the great Congo River. It was established by the Berlin Congress of 1884-85, which recognized its rank as a sovereign state. Since that date treaties with the European powers have recognized its sovereignty. The King of the Belgians, under whose sovereignty it was placed by the conference of Berlin, ceded his rights to Belgium. It has an area of 900,000 square miles, with a population of about 30,000,000.

Italian Possessions.—The Italian colonies of Africa are on the eastern coast, and include Eritrea, with an area of about 88,500 square miles, and the protectorate of the Somali coast, with an estimated area of 100,000 square miles. Italy's forward

policy in Africa dates from 1882, when she began to extend her claims northward along the Red Sea, but the adoption of an aggressive policy toward Abyssinia after 1888 resulted in the failure of her projects. After the defeat of Adowa, in 1896, she recognized the independence of Abyssinia, and submitted to a restriction of territory far below what she had formerly claimed. Eritrea, while not a flourishing colony, is fairly rich in pastoral products. It is under a civil governor appointed by the king, and responsible directly to the Italian minister of foreign affairs. The larger territory known as the Somali Coast Protectorate is still undeveloped, and the government is for the most part conducted by native chiefs.

Spanish Possessions.—To Spain belongs the comparatively unimportant territory of Rio d'Oro, with an area of about 243,000 square miles, and a population estimated at 100,000. Spain also claims a district on the river Muni, but the claim is contested by France. In addition to the Rio d'Oro, Spain has the Canary Islands, Tetuan in Morocco, and a few other small tracts, which comprise an area of about 3800 square miles.

Other States.—Egypt, whose status is more properly discussed in the article on Egypt, has an estimated area of 400,000 square miles, while the provinces of the Soudan, which have recently been regained for her, have an area of about 800,000 square miles. Though sometimes classified under the head of Turkish Africa, Egypt and the Egyptian Soudan are but loosely connected with Turkey, except that the Egyptian government pays a fixed revenue to the Porte. To the west of Egypt lie the Turkish possessions of Tripoli and Fezzan. The independent states are Morocco, Liberia, Orange Free State, the Transvaal or South African Republic, and Abyssinia.

Products.—In a continent which covers an area of nearly 12,000,000 square miles, there is naturally a great variety of products. In the north the products include a great variety of fruits and cereals which are appropriate to temperate and semi-tropical climates. Among them are wheat, barley, corn, rice, sugar, cotton, tropical fruits, and wines. In the zone lying nearer to the equator the natural products, which are largely exported, include ivory, palm nuts, palm oil, rubber, etc., and the cultivation of coffee, tobacco, cocoa, and other staples have recently been introduced. The products of a temperate climate are raised in the south, and include not only cereals, but cattle, goats, sheep, and horses, but the main source of wealth in Africa is the mines, especially the diamond and gold mines. The Kimberley mines, which were opened in 1868-69, are situated about 600 miles north of Cape Town, in Cape Colony, near the border of the Orange Free State. It is estimated that since their opening the value of the uncut diamonds produced is \$350,000,000. The great facilities for diamond mining in this district have resulted in a concentration of the industry at this point, so that about 98 per cent. of the diamond production of the world is from these mines. The centre of gold production is the Witwatersrand, a long, narrow strip of land in the Transvaal. Other gold mines are being rapidly developed to the north in the territory of Rhodesia. The mines of the Rand, or the Johannesburg mines, as they are sometimes called, have drawn thousands of gold-seekers to this district, and by peopling the Transvaal with an alien element have been responsible to some degree for the recent dissensions in that republic. Gold was discovered there in 1883, and beginning with a small output in 1884 of about \$50,000, they have each year added an increased amount to the world's gold supply. In the ten years, from 1888 to 1898, the annual product of these mines rose from \$5,000,000 to \$55,000,000. A large amount of capital was necessary for the working of the mines, which were not adapted to hand or placer mining. Since 1884 the total value of the products of the Rand mines is estimated at over \$300,000,000. South and Southeast Africa also contain valuable deposits of iron, coal, and other minerals, but these have not yet been developed.

Railways.—There has recently been a very rapid development of railways in Africa, and in 1899 it was estimated that the total mileage of roads completed or under actual construction was 10,000. A large part of the route from Cape to Cairo is covered by rail, and since the line already completed from Cape Colony to the north is about 1400 miles, and from Cairo to the south about 1100 miles, there remains only the intermediate distance of 3000 miles to be spanned if the Cape to Cairo project proposed by Mr. Rhodes is carried out. Railway lines from the east and west to connect with this trans-African railway are already completed or in process of construction. On the eastern coast there is a line already completed in Natal; another running northwesterly from Mombasa in British East Africa toward Lake Victoria Nyanza is completed for half of the route; another in German East Africa, from a point just north of Zanzibar, is in process of construction, and another also in German East Africa is projected from Zanzibar to Lake Victoria Nyanza. Another line on the east coast runs inland from Lorenzo Marques, in Portuguese East Africa, and another from Beira, farther north. In the French

Soudan there is a short line running from the Senegal to the Niger. In the Congo Free State a line connects the Upper with the Lower Congo. In Angola a line runs easterly from Loando. There are other projected lateral lines on both the east and the west, and there is even a project for a great trans-continental line through the French Soudan, which would join the countries of the Niger and the Senegal with those of the Nile Valley and the Red Sea. The greater part of the roads actually constructed are owned by the states or colonies through which they pass. Of nearly 3000 miles in Cape Colony and Natal, about 2000 belong to the government, and almost all of the lines in Egypt are owned and operated by the state.

Commerce.—The greatest development of commerce is found in the north and the extreme south. The north receives nearly three-fourths of the imports, which are for the consumption of the thickly populated regions along the Mediterranean and in the Soudan. In the south the greater part of the imports go to the gold and diamond region. While the north imports chiefly articles of personal consumption, the southern imports are largely made up of machinery and materials used in the mines, although flour, meat, and clothing make up an important part. The most rapid development of commercial ports has been in the south, where the business of the mines has stimulated trade. The ports of Cape Colony and Natal have increased in recent years at a remarkable rate. The chief sharer in African trade is England, owing to the fact that in the south her colonies of Cape Colony and Natal receive the imports destined for the mining regions, and are themselves wealthy and progressive countries. At the same time England's control of Egypt has resulted in giving to England a great share of Egyptian trade. The total foreign commerce of Africa is estimated at \$750,000,000, but much of the trade is not recorded. According to the report of the United States Bureau of Statistics, published in 1899, the importation at the ports where records were kept amounted, according to the most recent available figures, to \$395,296,552, and the exports to \$345,773,454. The chief exports of the north were agricultural products, cotton, cacao, spices, dates, etc.; of the tropical region ivory, rubber, palm nuts, and gums, and of the south, gold and diamonds. The distribution of imports among the possessions of the different powers was given as follows:

British territory.....	\$131,397,798
French territory.....	70,115,508
Turkish territory.....	54,090,670
Portuguese territory.....	11,862,729
German territory.....	4,992,907
Congo Free State.....	4,521,449

Commerce with the United States.—Less than 5 per cent. of the imports into Africa come from the United States, their value in 1898 being \$17,515,730. But the exports from the United States have shown relatively a very rapid increase owing to the increased demand for United States products in South Africa. The total exports from the United States to Africa rose from \$6,377,842 in 1895, to \$18,594,424 in 1899. The following table taken from the report of the United States Bureau of Statistics in 1899 gives the total value of imports into the United States from Africa, and exports from the United States to Africa, from 1890 to 1899, inclusive, for the fiscal year ending June 30:

Imports.		Exports.	
1890.....	\$ 3,321,477	1890.....	\$ 4,613,702
1891.....	4,207,146	1891.....	4,757,897
1892.....	5,318,052	1892.....	5,061,265
1893.....	5,857,032	1893.....	5,196,480
1894.....	3,479,338	1894.....	4,923,859
1895.....	5,709,169	1895.....	6,377,842
1896.....	11,172,979	1896.....	13,670,580
1897.....	9,529,617	1897.....	16,952,807
1898.....	7,193,639	1898.....	17,513,411
1899.....	10,440,060	1899.....	17,999,379

The Situation of Africa in 1899.—During the year 1898 the main objects of public attention in African affairs were the reconquest of the lost provinces of the Soudan by the Anglo-Egyptian army under Lord Kitchener, the dispute between France and England over the boundaries of their respective territories on the Niger, the still more serious dispute over the Fashoda question, the internal dissensions in the Transvaal, and the great Cape to Cairo railway project of Cecil Rhodes. In the course of the year the Niger boundary dispute was settled, and the conquest of the Soudanese provinces was practically completed; but the other matters were still subjects of discussion at the beginning of 1899. The long-standing Fashoda ques-

tion, which passed its acute phase with the withdrawal of Major Marchand from Fashoda toward the close of 1898, was finally adjusted on March 21, 1899, by the Anglo-French convention, which gave to England the territory which she had claimed on the Upper Nile, but compensated France by some valuable concessions elsewhere. (See FRANCE, paragraphs on History.) The chief interest in North-east Africa was thenceforth centred in the re-establishment of the Soudanese provinces under Lord Kitchener. (See EGYPT.) As to the Cape to Cairo railway project (*q. v.*), the most striking event was the visit of Cecil Rhodes to the German Emperor for the purpose of enlisting his aid on its behalf. But by far the most serious events occurred in the Transvaal, and culminated in the war between England and that republic, which was going on at the close of the year. An account of this will be found in the historical portions of the article on the Transvaal.

AFTER-IMAGES. An after-image is the impression still remaining in the eyes after looking at a light or indeed any visual stimulus of medium intensity. It is not observed ordinarily, unless the attention is called to it, and some persons disclaim all ability to see this effect at all. The after-image and its curious cycle of changes which have been observed by psychologists is the subject of a work published in 1899 by Dr. S. I. Franz. He found that to see an after-image seventy-five per cent. of the times the eye is stimulated it is necessary to have as stimulation either .01 second exposure, a surface of light 8 millimetres square ($\frac{1}{8}$ inch), and a light of .08 candle-power; or one second of exposure would require a surface only two millimetres square and .08 candle-power light; or, if the surface 8 millimetres square were exposed one second, a light of only .01 candle-power would be necessary. A number of interesting and curious features concerning the after-image should here be stated. (1) If one looks at a bright light and then completely darkens the eyes, the after-image does not immediately appear. For a short time nothing is seen. This short time is called the "latent period" of the after-image, and varies not only in individuals, but more or less with the strength of light used, the length of time it is looked at, and the area of the light. (2) The time the after-image lasts also varies with the different degrees of the three factors of the sensation—namely, the time, area, and intensity, and also according to the color of the light and the part of the retina which is affected by the light. The average duration of the after-image seems to be from twenty to one hundred seconds, though from extraordinarily strong lights it has been observed by some persons for days at a time. The influence of the color is shown by the fact that a white light gives the longest, and a yellow light or a green light produces a longer after-image than red or violet lights. In addition to these varying influences, there is seen to be much difference in the qualities of the after-image among different people, some, as has been mentioned, failing to notice it, and others being able, particularly after their attention has been called to it, to give a very good account of it. This suggests, what is probably the truth, that the after-image is something between a sensation and an idea. It is therefore largely influenced by the attention and the will. This influence of the mind is shown in another of the curiosities of the after-image—namely, its fluctuation. (3) The after-image of a bright white light is first seen by some persons as white, then black, then red, green, violet, etc., going through most of the colors of the rainbow before it finally disappears. In a series of experiments performed at the Columbia University laboratory it was found that with seventy-five students the first color seen was blue in 13 per cent. of the cases, purple in 10 per cent., green in 6 per cent., yellow in 4 per cent., and red in 2 per cent. of the cases. It does not always melt gradually from one color into another, but appears as one color, then disappears, to reappear as another color, and so on. An interesting account of the fluctuations of the after-image by a trained observer is that of Miss Washburn (*Mind*, January, 1899). She looked simply at the bright sky through the upper half of a window. She describes her after-images as follows: "After the momentary, positive, same-colored image, which appeared immediately on closing the eyes, there was an interval of five or six seconds, when a positive image came again. This image was at first rather fluctuating in color—patches of red and green sometimes appearing on it, but in a second or two the panes of the window filled out with sky blue, the window bars remaining dark. This blue stage then passed into a stage of vivid green, the image sometimes, but not always, disappearing between the two stages. The green image usually disappeared and reappeared five or six times, growing paler, almost whitish, in color toward the end. The image next assumed a deep red tone, while the black bars became luminous and slightly greenish, the light appearing first as a crack through the length of each dark bar. Here, of course, was the transition from the positive to the negative image. The red stage, after undergoing several fluctuations, gave place to a deep blue image with yellowish bright lines, which lasted longer than any of the preceding, growing gradually darker, until it became indistinguishable." (4) The after-image retains the *shape* of the light by which it is originally produced,

and (5) follows the movements of the eye. (6) Its shape is, however, apparently altered, according to the angle of the plane of the surface looked at. For instance, if one looks first at a square, the after-image of this figure, when the eyes are directed perpendicularly toward a plane surface (such as a white wall), will appear in shape like the original figure; but if the eyes are directed at an acute angle with the wall, the figure will appear to be a rhombus. (7) Some persons have thought that they could transfer an after-image from one eye to the other. If the left eye be closed and the right directed to a bright light for a few seconds, they claim the after-image will be transferred from that eye to the right. This they hold to be a proof that the after-image is the result of the activity not of the retina, but of the brain, because if it were of the retina, it would be seen only in one eye. Both the facts and the theory of these persons have been disputed by others, who point out that the two eyes always operate as one machine, and it is impossible to say that an after-image is seen in one eye to the exclusion of the other; or that, if it were, this would not prove that a stimulation of one retina would cause activity of a like nature on the part of the other. (8) After-images are peculiar phenomena, psychologically, as they lie on the borderland between sensation and idea. They generally have to be produced, like sensation, by an objective stimulus, though cases are on record of their having been created by a mere effort of will. On the other hand, they are largely affected and can sometimes be controlled by subjective effort. Miss Washburn (*vid. supra*) succeeded in controlling to a certain extent the fluctuation of colors in her after-images by conscious voluntary effort. (9) The after-image is to be distinguished, by several criteria, from the memory image, so called. The memory image is not, like the after-image, only a visual image, but may be from any one of the senses. It is illustrated by the recurrent mental vision of some sight which has profoundly impressed the spectator emotionally, or has made a deep impression by long-continued use, as the field of a microscope returns before the mind's eye of those who use it much. Another illustration is the frequency with which a musical air recurs in the memory, independently of the will. Other features of the memory image, distinguishing it from the after-image, are the natural color and proportions of the former as contrasted with the peculiar color cycles of the after-image and its tendency to follow the eye and conform itself to the angles of the surfaces upon which it is projected. It is considered to be universally true of after-images that they seem larger when projected on a distant surface than when thrown on a near one. The visual images of imagination, on the other hand, are never thus affected. For an ingenious use of the after-image in the methods of experimental psychology, see **PSYCHOLOGY, EXPERIMENTAL** (paragraph *Psychology of Reading*).

AGASSIZ ASSOCIATION, an association of young people, founded in 1875, for the purpose of encouraging personal work in natural science. The society was incorporated in 1892. It publishes the *Hand-book of Agassiz Association*. The official organ is *The American Boy*. President, Harlan H. Ballard; secretary, E. T. Slocum, Pittsfield, Mass.

AGNEW, JOHN THOMPSON, who died November 29, 1899, was a well-known banker and representative Democrat of New York City. For the past thirty years he had been vice-president of the Continental National Bank. For the previous thirty years he had been a member of the wholesale tobacco house of William Agnew & Sons. In his political life he was a strict party man. He was associated with August Belmont, William Wood, and W. C. Hunt in laying the foundations of the political prosperity of Tammany Hall. He was a personal friend of Tilden and Governor Hoffman, and was himself offered the Democratic nomination for governor in a year when his party was successful. He was also a member of the Electoral College that chose Cleveland and Hendricks. Mr. Agnew was, further, president of the Park Bank in the seventies and trustee of the Brooklyn Bridge, 1877-85, and of the Presbyterian and Ear and Eye Hospitals. He was also a member of many societies and clubs, being one of the founders of the Manhattan Club.

AGRICULTURE. The solution of problems connected with the sciences underlying agriculture and the practical application of these results show a steady increase,

The sciences underlying agriculture are various, hence agricultural progress means increased activity along more than one line, and since the chief aim of agricultural progress is utilitarian in its nature, this spirit is being continually inculcated in its associated branches of science. While there has been a wholesome and persistent progress made in the sciences relating to agriculture during the past year, it is not easy to discern at the present time whether any of these discoveries will exert a revolutionary influence upon agricultural practices. Indeed, it is very seldom that we can properly estimate the importance of a single scientific discovery at its birth, but must wait some time in order to obtain a retrospective view of the same. The discovery of special bacteria capable of giving superior

flavor to butter, etc., was heralded a few years ago as an epoch-making discovery in dairying, but experiments made during the last two years have resulted in causing dairymen to look at the pure-culture practice in a much less favorable light. On the other hand, the discovery of bacteria in the tubercles of the leguminosæ a number of years ago was not thought to be of any great practical utility, but every year's experiments have shown that these organisms in possessing the ability to utilize the free nitrogen of the air and surrendering it to the plant are capable of being of the greatest practical value to agriculturists. It is not so much the results of single experiments leading to discoveries which constitute the greatest value to science, but, on the other hand, it is the correlation of the results of various experiments which enables us to recognize progress. The past year has witnessed progress in the agricultural institutions of the United States devoted to teaching, and the agricultural experiment stations have shown evidence of advancement in presenting a more thorough, higher, and more permanent class of work.

Experiment Stations.—Agricultural experiment stations are now in operation under the Act of Congress of March 2, 1887, in all of the States and Territories. The total number of experiment stations in the United States is 54; of these, 52 receive the appropriation provided for in the Act of Congress of 1887. The total income of the stations during 1898 (later statistics are not at hand) was \$1,210,921.17, of which \$720,000 was received from the national government, the remainder, \$490,921.17, coming from the following sources: State governments, \$341,897.94; individuals and communities, \$177.20; fees for analysis of fertilizers, \$93,677; sales of farm products, \$65,356.25, and from miscellaneous sources, \$20,312.48. In addition to this, the United States government appropriated \$35,000 for the years 1898 and 1899, \$5000 of which goes for Alaskan investigation, where an experiment station has already been established, and the remainder is used for special work connected with other stations. In each of the States of Alabama, Connecticut, New Jersey, and New York a separate station is maintained wholly or in part by State funds, and in Louisiana a station for sugar experiments is maintained partly by funds contributed by sugar planters. Efforts are also being made at the present time to establish stations in Hawaii, Porto Rico, and the Philippines. According to government statistics, the value of additions to equipment of stations during 1898 is as follows: Buildings, \$109,851.65; libraries, \$11,700.73; apparatus, \$19,195.42; farm implements, \$10,800.27; live stock, \$13,151.33; miscellaneous, \$11,972.97, which gives a total of \$176,469.41. At the present time the stations employ 669 persons in the work of administration and investigation.

The number of officers employed in the different lines of work is as follows: Directors, 75; chemists, 148; agriculturists, 71; experts in animal husbandry, 10; horticulturists, 77; farm foremen, 29; dairymen, 21; botanists, 50; entomologists, 46; veterinarians, 26; meteorologists, 20; biologists, 11; physicists, 11; geologists, 6; mycologists and bacteriologists, 19; irrigation engineers, 7; in charge of sub-stations, 15; secretaries and treasurers, 23; librarians, 10, and clerks, 46. There are also 21 persons classified under the head of "miscellaneous," including superintendents of gardens, grounds, and buildings, apiarists, herdsman, etc. Three hundred and five station officers do more or less teaching in the colleges with which the stations are connected.

In 1898 there were published 406 annual reports and bulletins. In addition to this, there was published by many States a number of press bulletins or digests, which were widely reproduced in the agricultural and rural papers. The experiment station mailing list now aggregates half a million names, and correspondence with farmers is constantly increasing. It may be of interest to compare the condition of the experiment stations in the United States in 1889. There were at that time 46 stations, with a staff of 402 men, having a government appropriation of \$600,000, and \$125,000 was received from the States and other legal sources, which shows a considerable increase during the last ten years, both in funds and investigators.

It is impossible, on account of the limited space given to this subject, to present a résumé of the enormous number of papers published annually upon agricultural subjects. Some idea, however, can be obtained of this work by consulting the tenth volume of the *Experiment Station Record*. This volume, which attempts to give an abstract of most of the agricultural literature published throughout the world, comprises for 1899 1220 pages and contains abstracts of 361 bulletins and 35 annual reports of 53 experiment stations in the United States, 172 publications of the Department of Agriculture, and 1224 reports of foreign investigations. The total number of pages in these publications is 57,230; the total number of articles abstracted is 2023, which touch upon such subjects as chemistry, botany, fermentation, bacteriology, zoology, meteorology, air, water, soils, fertilizers, field crops, horticulture, forestry, seed, weeds, diseases of plants, entomology, food and animal production, dairy farming and dairying, veterinary science, technology, agricul-

tural engineering, and statistics. The aggregate number of articles abstracted for the preceding year (1898) was 1810, or over 200 less than in 1899.

Some important lines of experiment station work may be briefly referred to here. The life history of noxious insects and the methods of combating the same is receiving constant attention, and the importation of a Mediterranean insect into California for the purpose of fertilizing the fig is meeting with success. The annual appropriation of \$200,000 by the State of Massachusetts for the suppression of the gypsy moth constitutes the most important economic experiment so far attempted. The introduction of many new economic plants into the United States, the testing of new varieties of grasses and fruits, and the breeding and selecting of plants for the purpose of obtaining hardy stock for certain localities have received much attention. The plant diseases that have been studied are the peach-leaf curl and pear blight, also some characteristic of the sweet potato, sea-island cotton, lemon, orange, asparagus, chrysanthemum, tobacco, etc. Co-operative work in forestry has been begun with farmers, and the study of soils and irrigation in the West has received much attention. The investigations relating to animal feed-stuffs, fertilizers, plant foods, soil exhaustion, and dairy work have accomplished much.

In Japan the organization and work of experiment stations has recently been much improved. Less than a decade ago Japan could boast of only one station, whereas at present there are in that empire ten experiment stations under government control, besides nineteen branch stations, the chief work of which is to teach farmers the application of the results obtained by the more technical experiment stations.

The British government has recently established an elaborate plan for agricultural education and research in the West Indies. Four central and eight local experiment stations for the improvement of sugar-cane are to be established on the island of Barbados, and similar investigations are being inaugurated at Antigua, St. Kitts, and Trinidad. Botanical stations are to be continued and developed at Tobago, Grenada, St. Vincent, Barbados, St. Lucia, Dominica, Montserrat, Antigua, and St. Kitts Nevis. An agricultural school has been opened at Dominica, and others will be started at St. Lucia, St. Vincent, and St. Kitts Nevis.

Agricultural Teaching.—Agriculture, although resting on the foundation of a number of biological and abiological sciences, is not itself differentiated enough at the present time to be classed as a science. In this respect it resembles geography, which has for its aim the teaching of a great variety of natural phenomena. As a result of this heterogeneity, agriculture has never possessed a logical or pedagogical form, and further attempts have been made during the past year to improve its subject-matter and its sequence of presentation in courses of study. Any effort to straighten out the collegiate course in agriculture must be considered decidedly in the line of progress, inasmuch as agriculture is not likely to be confined in the future to special institutions, but on account of its necessitating a broadly related knowledge of a number of fundamental sciences, it possesses great pedagogical advantages, which are already being made use of in our secondary schools. It is, indeed, in this line of elementary teaching of agriculture that the present year shows remarkable progress and opens up prospects for agriculture which have never before been realized.

During the past year a law has been passed in Missouri calling for instruction in agriculture and horticulture in the public schools, and the State of New York appropriates \$25,000 per annum for the purpose of carrying on simple experiments in crop fertilization in different sections of the State as object-lessons to farmers. The instruction of the school teachers in rural districts in nature study work, and the introduction of nature study into the rural schools. This work is carried on by means of leaflets written in a pleasing and elementary manner, describing simple experiments in plant growth, etc., by personal contact with teachers and by extensive correspondence. By this means it is intended not only to teach the rising generation of farmers how to observe, think, and draw deductions from phenomena, but it is also endeavoring to accomplish great results in educating the farmer to appreciate modern methods of agricultural practices. The result hoped for in all this work is to cultivate a love for nature, to render farming less prosaic, and develop a spirit of content in the rural community. The State of Indiana through its agricultural institution at Lafayette has made a beginning in a similar line of work, but at the present time no large appropriation has been granted for this enterprise.

In addition to this work just described, there are numerous farmers' reading courses established in many of our States, which have for their aim the diffusion of agricultural knowledge and development of enthusiasm in the farmer. Much progress has been made in this movement within the past year. The courses of reading are conducted by the agricultural institutes and experiment stations of the several States in which they have been established. At the present time such reading courses are given in Pennsylvania, Michigan, New Hampshire, Connecticut,

New York, West Virginia, and South Dakota. A large series of popular works upon agriculture are pursued by the members of these reading clubs, and the amount of interest manifested in them is increasing. Supplementary to work of this nature are the farmers' institutes which are in general operation throughout the United States. They are generally supported by the State, and are under the control of the State Secretary of Agriculture or some other person authorized to manage them. Statistics in regard to farmers' institutes show that during the past year some two thousand institutes were held in different parts of the country, which were attended by about one-half million of farmers. The character of these meetings is constantly changing for the better, which is due in a large measure to the influence of the agricultural colleges and experiment stations. During the past year the services of college and station officers have been in greater demand at the farmers' institutes than ever before. Increased interest in agricultural teaching has also been manifested in many foreign countries within the past year. Beginning with the September school term of 1899, the minister of education in Ontario has made agriculture a compulsory subject in two forms of all the rural public schools, and allows it to be taken as an optional in all urban public and high schools. Manitoba has taught agriculture in her public schools for two years, and this subject is still being pursued, and during the past year Nova Scotia and New Brunswick have added agriculture to the curricula of their common schools.

In European countries the interest in agricultural teaching is receiving unusual attention. Steps have already been taken in Russia for the establishment of about 50 additional agricultural schools. There are at the present time in Russia 3 schools for higher agricultural instruction, 9 agricultural high schools, 83 lower schools, and 59 special courses, and the new elaborated plan calls for an extensive system of agricultural education. The scheme provides for (1) higher education, furnished by independent agricultural institutes, located in the chief agricultural zones of Russia, and by chairs of agricultural and allied sciences in the universities; (2) agricultural high schools, which are in the nature of technical schools and schools with courses in agriculture; (3) lower agricultural schools, and (4) the diffusion of general agricultural information.

In the British West Indies arrangements have been made to instruct the teachers of elementary schools in agriculture, and it is also proposed to attach an agricultural instructor to the various stations established throughout the British West Indies, whose purpose it will be to go about giving instruction and demonstrations to planters, etc.

In Germany, where there are already many schools of different grades devoted to agricultural and horticultural pursuits, we find progress still being made in introducing agricultural teaching in the secondary schools. Some of the common schools possess extensive and well-defined nature study courses, in which agricultural and horticultural subjects predominate, and these schools are in some cases provided with extensive gardens and vineyards, that are cared for by the students, and which enable them to become familiar with many vital points connected with gardening. These types of schools are on the increase in Germany at the present time.

The authorities of France are thoroughly awake to the necessity of agricultural training, and are at present inaugurating and carrying on a thorough system of agricultural training. In conclusion, we believe it is but just to state that the work inaugurated and accomplished during the past year, as shown by the scientific quality, practical value, and amount of research work turned out, the great impetus given to agricultural teaching throughout the civilized world, which is the best indicator of the universal recognition which agriculture is receiving, cannot be equalled by any other branch of industry or science.

Text-books, etc.—The following works of a general nature have appeared during the year: *The Principles of Agriculture*, by L. H. Bailey et al.; *Outlines of Dairy Bacteriology*, by H. L. Russell; *Primer of Forestry*, by G. Pinchot; *Text-book of Agricultural Botany*, by J. Percival. See COTTON AND THE COTTON INDUSTRY; SILK MANUFACTURING; IRRIGATION.

AGUINALDO, EMILIO, the leader of the Filipino insurrection against the United States, was born about thirty years ago. After the native insurrection of 1896 he went to Hong Kong, agreeing permanently to forsake the Philippines on the payment of a large sum of money by Spain. In 1898 he returned to Manila with the expressed purpose of aiding the United States. Although he is said to have been an efficient ally for a time, his methods were somewhat dictatorial. He represented the American Consul at Hong Kong as promising him, on the authority of the United States, the future independence of the Philippines, and when he became convinced that annexation was the only hope, he organized a provisional government and proclaimed himself president, in June, 1898. Severe but ineffective fighting was carried on against the United States troops by Aguinaldo's forces

during 1899: He showed considerable ability in organizing and holding together the various elements which made up his recruits, as well as in checking the jealousy and rivalry which were in evidence among some of his officers. Finally Luna, the insurgent Secretary of War, and with Pilar, the most dangerous rival of Aguinaldo for the dictatorship, was assassinated. On the anniversary of the declaration of the independence of the Philippines, in June, 1899, Aguinaldo delivered a fervid speech, which was printed in the national organ, *Independencia*. In this apostrophe to his countrymen, the Filipino chief declared that Spain should be forgiven and be recognized as the mother-country, but that the United States should be driven out and the independence of the islands achieved. On July 27 he addressed an appeal to the powers for the recognition of independence in the Philippines. Soon after this the native troops became so hard pressed by the Americans that their leader was forced to move his capital from place to place. After retreating with a small detachment for several weeks before the American advance, he fled to the mountains. There he was closely pursued for a time, but without being taken. In regard to the personality of Aguinaldo, few authoritative statements are obtainable. It seems to be generally conceded among those who have known Aguinaldo personally that he is shrewd and naturally intelligent; brave; often kind, especially among his troops, but sometimes vindictive. It is said that he is possessed of a certain magnetism, and has considerable tact, to which is attributed much of his influence among the natives. There is a considerable difference of opinion as to the extent of Aguinaldo's education, but he is far better taught than the average Filipino. It has been said on the one hand that, although naturally sincere, he is easily influenced by unscrupulous advisers, while on the other hand an educated Filipino of this country says that he brooks no opposition, and that in no event does he consult with others. In the United States distrust is felt by many people as to the motives of Aguinaldo. Others consider him in the main right-minded, but unable to compel the forces over which he exercises a nominal authority. A third group has placed him upon a pedestal as a second Washington.

AIR CUSHIONS. See ELEVATORS.

ALABAMA, one of the Gulf States of the United States, has an area of 52,250 square miles. The capital is Montgomery. Alabama was admitted to the Union December 14, 1819.

Agriculture.—The following shows the production and value of the principal crops in the calendar year 1899: Corn, 33,015,120 bushels, \$15,517,106; wheat, 431,186, \$383,756; oats, 3,012,070, \$1,295,190; rye, 14,576, \$15,159; potatoes, 335,832, \$292,174, and hay, 82,746 tons, \$943,304. Live stock, January 1, 1900, comprised: Horses, 133,546, \$6,105,518; mules, 132,321, \$7,961,050; milch cows, 231,602, \$4,265,157; other cattle, 279,278, \$3,061,719, and sheep, 171,799, \$262,767. See COTTON AND THE COTTON INDUSTRY.

Industries.—The annual report of the State Mine Inspector, issued in 1899, shows that the total output of coal in 1898 was 6,504,960 tons, an increase over the previous year, which reached the highest figure up to that time, of 611,189 tons. Jefferson County, which contains Birmingham, led with 4,048,554 tons, and the smallest output was in Winston County, 7839 tons. The average number of working days was 300, and 1899 opened with a promise of work six days a week throughout the year. There were no labor troubles nor prospects of any. The most notable industrial feature of 1899 was the unusual activity in iron and steel interests. A syndicate of Northern capitalists bought a group of coal, iron, furnace, and coking properties, and within the year built nearly 500 additional coke ovens, trebled the output of coal, and secured an aggregate capacity of 180,000 tons of pig-iron per annum. Another syndicate bought the Talladega Iron Furnaces, with 3000 acres of coal and iron lands, for immediate and fuller development. Twelve additional furnaces in various parts of the State were put in blast, increasing the iron output of the State by more than 20 per cent.

At Ensley, near Birmingham, Thanksgiving Day was celebrated by making the first run of steel in the new mill of the Alabama Steel and Shipbuilding Company. This plant has a capacity of 1000 tons per day, has 12 furnaces, and cost \$1,500,000. Near by is the new steel rod, wire, and nail mill of the Alabama Steel and Wire Company, which cost about the same amount, and was expected to be ready for work early in January, 1900. In the same line is to be noted the sale to an iron and steel company of 3440 acres of coal lands belonging to the State University for immediate development. The year was also a remarkably prosperous one for the cotton mills. There was a further large increase in the number of looms and spindles, and the Dallas mill doubled its capital preparatory to erecting a new plant with 1000 looms, 25,000 spindles, and a bleachery, for the manufacture of a finer grade of goods than has yet been attempted in the South.

The coking industry was represented in 1898 by 24 establishments, with

5363 ovens, which used 2,573,713 short tons of coal and yielded 1,479,437 short tons of coke, valued at \$3,064,960, giving the State third rank in this industry. Alabama also held third place in the production of iron ore, the output being 1,853,111 long tons of red hematite and 548,637 long tons of brown hematite, in all 2,401,748 long tons, valued at \$1,632,208, an increase in a year of 303,127 long tons. The production of pig-iron was 1,033,676 tons, and of all kinds of rolled iron and steel, 59,897 long tons. The quarry products were sandstone and limestone, of a total value of \$270,177. See ALUMINIUM; COTTON AND THE COTTON INDUSTRY.

Commerce.—In the fiscal year ending June 30, 1899, the imports of merchandise at the port of Mobile were valued at \$1,590,648, an increase in a year of \$466,247, and the exports were valued at \$8,902,119, a decrease of \$682,129. The imports of gold and silver amounted to \$37,059, a decrease, and there were no exports of either during the year. The total foreign trade of the port was \$10,629,826, a decrease of \$134,675 from that of the previous year.

Railways.—With the exception of Louisiana there was a greater mileage of new construction completed in Alabama during the calendar year 1898 than in any other Southern State, and among all the States Alabama ranked sixth in this respect. The actual construction was 150.30 miles. In 1899 it was 141.35 miles, giving the State an aggregate of 4047.59 miles.

Banks.—On October 31, 1899, there were 27 national banks in operation and 13 in liquidation. The active capital aggregated \$3,205,000; circulation, \$1,309,220; deposits, \$9,577,401; reserve, \$2,750,445; and resources, \$15,045,793. The State banks, June 30, 1899, numbered 19, and had capital, \$938,200; deposits, \$2,212,777; and resources, \$3,794,112. The exchanges at the United States Clearing-House at Birmingham in the year ending September 30, 1899, aggregated \$30,215,716, an increase in a year of \$7,109,273.

Education.—In the common school statistics there are no changes to report from those of the school year 1896-97. At the close of the school year 1897-98 there were 48 public high schools reported, with 117 teachers and 2577 students; 66 private secondary schools, with 164 teachers and 2761 secondary students and 3836 elementary pupils; 6 public normal schools, with 91 teachers and 1570 students; and 3 private ones, with 97 teachers and 1506 students. Nine colleges and universities for men and for both sexes reported 38 scholarships; 114 professors and instructors; 1823 students; 61,250 volumes in the libraries; \$70,350 invested in scientific apparatus; \$865,000 in grounds and buildings, and \$365,000 in productive funds; and \$115,115 in total income. A like number of colleges for women reported 101 professors and instructors; 1057 students; 9700 volumes in the libraries; \$321,000 invested in grounds and buildings; and \$83,500 in total income. In 1889 there were 232 periodicals, of which 21 were dailies, 187 weeklies, and 11 monthlies.

Finances.—The total bonded debt of the State on March 1, 1899, was \$9,357,600, no change being reported in the preceding year. The assessed property valuations in 1898 aggregated \$256,256,295, an increase of \$4,866,161; tax rate, 5½ mills; and amount of taxes, \$1,410,191.

Population.—As estimated by Federal officials, the population on June 30, 1899, was about 1,730,000.

Legislation.—Laws in the interests of primary elections were enacted, in accordance with which frauds, if detected, may be punished. The song-birds were protected by game laws of a stringent character. A full system of quarantine was established to ward off infectious diseases. The claims of labor were recognized by making labor wages preferred claims when receivers of corporations are appointed. A dispensary law for the sale of liquors was passed. To the list of misdemeanors were added: Making or certifying false abstracts; detaching or uncoupling trains, pulling bell-cords or emergency valves; obstructing tracks; interfering with switches or signals without authority; stealing a ride or discharging firearms from trains. A license tax on nearly all occupations was provided for, but cotton and other agricultural products and pig-iron are exempt from taxation in the hands of producers or purchasers for prompt shipment.

State Officers and National Representatives.—Governor, Joseph F. Johnston; secretary of state, Robert P. McDavid; treasurer, George W. Ellis; auditor and comptroller, Walter S. White; adjutant-general, W. W. Brandon; attorney-general, Charles G. Brown; superintendent of education, John W. Abercrombie; commissioner of agriculture, Isaac F. Culver. Supreme Court: Chief justice, Thomas N. McClellan; associate justices, Jonathan Haralson, John R. Tyson, Henry A. Sharpe, and James R. Dowdell; clerk, R. F. Ligon, Jr. The State Legislature consists of 1 Republican, 101 Democrats, and 21 Populists. Senators: John T. Morgan and Edmund W. Pettus, both from Selma. Representatives: George W. Taylor, from Demopolis; Jesse F. Stallings, from Greenville; Henry D. Clayton, from Eufaula; Gaston H. Robbins, from Selma; Willis Brewer, from Hayneville;

John H. Bankhead, from Fayette; John L. Burnett, from Gadsden; Joseph Wheeler, from Wheeler; and Oscar W. Underwood, from Birmingham—all Democrats.

ALASKA, an unorganized territory of the United States, comprising the north-western part of North America, purchased from Russia in 1867, with an area, as far as now known, of 531,000 square miles; seat of administration, Sitka.

Topography.—During 1899 several parties were engaged in the examination and survey of Alaskan waters, under the direction of the United States Coast and Geodetic Survey. The coast-line of the central part of the Yukon delta was found to be 10 miles farther to the westward than previously charted, and the river from its mouth to Andreafski 25 miles longer than heretofore supposed. One party mapped the shore-line of the entire delta, a distance of 90 miles. The Coast Survey steamer *Patterson* ran 3600 miles of soundings to determine the character of the "mud lumps" of the Yukon flats; demonstrated that Golovin Bay is navigable for vessels drawing 16 feet of water as far as the inside spit, and that the lower bay and sound, instead of being filled with shoals, according to existing charts, is safely navigable for seagoing vessels; and discovered and surveyed a bay named Port Safety, 2 miles wide and 3 miles long, about 12 miles north of Cape Nome Bay.

The most important topographical discovery of the year was that of Captain William R. Abercrombie, U. S. A., who for two years had been at the head of an expedition organized to survey an all-American route from tidewater to the gold-fields. His work was completed in November, and the new route to the Klondike is briefly described as follows:

"The route selected is an almost direct path, 385 miles long, to Fort Egbert, Eagle City, on the Yukon River, and it is 60 miles from Eagle City by the river to Dawson, though the distance between the two places is not so far as that overland through Canadian territory. This route will open up the heart of Alaska and allow Americans to travel over their own domain without coming into conflict with the officials of a foreign nation. It is shorter by 200 miles than the present route by way of Dyce, Chilkoot Pass, Lake Bennett, and the Yukon River. Of course, the other route by way of St. Michael is out of the question. It is 2100 miles long."

Pending the settlement of the boundary question by the governments of the United States and Great Britain, and acting under the terms of a *modus vivendi*, negotiated on October 20, the following commissioners were appointed in December to delimit the provisional boundary between Alaska and Canada about the head of Lynn Canal: On the part of the United States, O. H. Tittman, assistant superintendent of the Coast and Geodetic Survey; on the part of Great Britain, Professor F. King, royal astronomer at Ottawa.

Industries.—The season of 1898-99 yielded much larger mining results than the previous one, due in a large measure to the remarkable yield of the newly discovered deposits in the Cape Nome region, between Norton Sound and Bering Sea, and about 70 miles from St. Michael. The first discovery here was made late in 1898, and, as it became known almost immediately, a rush set in for the region even greater than that which followed the early Klondike strikes. Experienced miners abandoned well-paying claims for the new bonanza, and by midsummer sufficient knowledge of the district had been acquired to warrant the assertion that it out-rivalled the Klondike itself, and to suggest the belief that the district contains the mother lode of a series that extends far into Siberia. In the midst of excitement over the Cape Nome developments, another surprise appeared as a result of prospecting at Cape York, 120 miles from Cape Nome, where, as at Cape Nome, rich beach diggings were disclosed. Both districts gave about equal promise, with an advantage for Cape York in the possession of an admirable harbor. Developments of more than usual interest were also made on Money Creek, Mary Island, and on the reservation of the American Missionary Association at Cape Prince of Wales.

It is impossible to give more than an estimate of the value of gold mined in the season of 1898-99. A few figures of known amounts are suggestive. On a single day, July 18, four steamers landed at Seattle, Wash., San Francisco, and Vancouver, B. C., an aggregate valued at \$7,000,000. It was believed that at least \$2,000,000 more was brought down by passengers in small hand-packages, and not reported. George E. Roberts, Director of the United States Mint, stated in July that the American receipts from the Klondike in the first half of the calendar year amounted to \$11,000,000 in gold, and he estimated that the yield of the full year would be \$18,000,000 or \$20,000,000. The receipts of the first six months equalled the total of the previous year. United States Consul McCook, at Dawson, Yukon Territory, reported that instead of \$20,000,000, which was estimated as the probable output of that district, he was informed that \$10,000,000 would fully cover the product. He also declared his belief that more gold will be found in Alaska than will ever be taken from Yukon Territory.

Industrial operations in 1899 were by no means confined to gold. A railway is being constructed from tidewater to Cook Inlet to facilitate the mining of the large deposits of coal there in 1900. Three large copper-gold claims on Cape Fox were being prepared for thorough working by a Chicago syndicate. The copper mines on Prince of Wales Island yielded sufficient ore to promise the employment of large reduction works for several years to come. Encouraging results were also obtained from the White Horse copper district. The first discovery of asphaltum in Alaska was made on the shores of Mary Island, an extensive deposit of excellent quality. Late in the year machinery was assembled along the Cook Inlet coast for next season's development of the petroleum fields.

Commerce.—In the fiscal year ending June 30, 1899, the imports of merchandise in the customs district of Alaska were valued at \$196,251, and the exports were valued at \$45,729, an increase in each. The imports of gold aggregated in value \$9,065,000, against \$50 in the previous year, and there were no exports.

Banks.—On October 31, 1899, the Territory had one national bank, with capital, \$50,000; circulation, \$11,250; deposits, \$157,304; reserve, \$74,745, and resources, \$215,209.

Education.—In October, 1899, ground was broken in Skaguay for the first college in Alaska, a co-educational institution. It was opened for the fall term in a temporary building, with 50 students, and Dr. La Motte Gordon as president and Mrs. Sarah McComb as preceptress. The school population of the Territory in the year 1897-98 was from 8000 to 10,000, of whom 1250 were enrolled in 18 schools maintained by the government. The appropriation for the school year was \$30,000. Within two years towns have sprung up at St. Michael, Circle, Rampart, Peary, Weare, and Eagle, and government schools are now urgently needed in each of these places. In 1898 there was not a single school for white children in the vast region drained by the Yukon and its tributaries. A much larger appropriation is imperative. Besides the 18 government schools, there were an industrial school at Sitka, 13 Protestant Episcopal mission schools, 1 Congregational, 4 Roman Catholic, 7 Moravian, 1 Methodist Episcopal, 3 Friends, 1 Baptist, 7 Presbyterian, and 5 Swedish Evangelical. The Roman Catholic Church also maintains two hospitals at Dawson, Yukon Territory, and the Baptist Church an orphanage on Wood Island. At the end of 1899 there were 7 periodicals, of which 6 were weeklies.

Needs of the Territory.—A territorial convention was held in Juneau in October, 1899, which adopted a memorial to Congress setting forth some of the pressing necessities of the Territory. These include two additional judges of the district court; probate judges, with jurisdiction also in certain civil and criminal cases; commissioners with powers of justices of the peace, and magistrates with like powers, for incorporated cities and towns; larger educational facilities for white children; a code of civil procedure; amendments to the criminal code; a general municipal incorporation law; a modification of the mineral land laws, to prevent wholesale appropriations of public mineral lands by a few individuals; an extension to Alaska of the homestead, timber, stone, and coal-land laws, and a delegate in Congress. John G. Price, of Skaguay, was elected a representative of the people at Washington. Governor Brady, in his annual report, made another plea for Statehood, and urged the establishment of cable and telegraph lines, the branding of fur seals, a prohibition of killing them for ten years, and suitable public buildings at Sitka.

Population.—As estimated by federal officials, the population on June 30, 1899, was about 40,000.

ALASKAN BOUNDARY QUESTION. *Diplomatic History of the Dispute.*—The Anglo-American dispute over the Alaskan boundary centres in the interpretation of certain passages in the treaty of 1825 between Russia and Great Britain. This treaty arose from the extension of Russian claims to lands over which Great Britain and the United States believed themselves to be entitled to jurisdiction. These Russian claims appeared in certain grants of privileges to the Russian-American Company. The ukase issued by Emperor Paul, in 1799, granted this company the right to use all hunting-grounds and establishments then existing on the Alaskan coast from 55° north latitude to Bering Strait, to make new discoveries south of that degree, and to occupy new lands as Russian possessions, if not already occupied by or dependent upon another nation. In 1821 the privileges granted to the Russian-American Company were enlarged, and the right of carrying on commerce, fishing, and other industries was extended to the entire northwestern coast of America, from Bering Strait to 51° north latitude. All foreign vessels were forbidden to land on the coasts or islands of this region, except in case of distress. This extension of claims aroused opposition both in the United States and in Great Britain, since each of these powers claimed lands north of the 51st parallel of latitude. Negotiations followed and resulted in a convention between the United States and Russia in 1824, and in the

THE NORTHERN TERMINUS OF THE WHITE PASS & YUKON RAILROAD, AT LAKE BENNETT, WHERE GOLD SEEKERS CAN TAKE A STEAMER FOR THE KLONDIKE.

famous treaty between Great Britain and Russia of 1825. By the convention of 1824 it was provided that the United States should form no establishment north of the parallel of 54° and 40', and that Russia should form none south of that parallel. The treaty with Great Britain defined the boundary line between the Russian and the British possessions in articles 3 and 4, which will be discussed in the following paragraph. At this point we merely mention the fact that the terms of those articles did not become the subject of dispute until recent years. Not till 1872 was there any dispute as to the meaning of the definition contained in the treaty of 1825, the United States having in 1867 acquired Alaska from Russia, and having retained the boundary-line as described in the older treaty. On December 2, 1872, President Grant, in his annual message, drew attention to the fact that for the first time in the history of the United States there was no question of disputed boundary between this country and the possessions of Great Britain. But he recognized that difficulties might arise over the Alaskan boundary so soon as the territory should be settled and conflicting interests become apparent. He therefore recommended the appointment of an international commission to determine the line between our territory of Alaska and the adjoining possessions of Great Britain. His recommendation was not acted upon. A joint commission was again proposed in 1886 by the United States government, and in 1888 conferences were held between representatives of the United States and the Canadian governments to discuss the matter. In 1892 the governments of the United States and Great Britain entered into a convention to make a joint survey in order to ascertain the data necessary to the permanent delimitation of the boundary line. As a result of this the joint surveys were made, but no recommendation was offered as to the boundary line. Finally, by the protocol of May, 1898, one of the subjects to be discussed by the Joint High Commission was the provision for the delimitation of an Alaskan-Canadian boundary. The commission came to no agreement on this point, and in 1899 the question was still the subject of dispute; but on December 20 of that year it was announced that a *modus vivendi*, providing for a temporary and convenient boundary line had been agreed upon by the two governments. Thus the matter was taken out of the hands of the Joint High Commission. On the whole, this temporary settlement was to the advantage of the United States. The boundary being placed at a distance of 22¼ miles above Pyramid Harbor, the Canadians did not secure a point on the Lynn Canal; nor was any concession made of a free port or free transfer of Canadian goods through the American territory, although it was thought that these matters might come up for discussion later. The text of the *modus vivendi* is as follows:

"It is hereby agreed between the governments of the United States and of Great Britain that the boundary line between Canada and the territory of Alaska in the region about the head of Lynn Canal shall be provisionally fixed, without prejudice to the claims of either party in the permanent adjustment of the international boundary, as follows:

"In the region of the Dalton Trail, a line beginning at the peak west of Porcupine Creek, marked on the map No. 10 of the United States Commission, December 31, 1895, and on sheet No. 18 of the British Commission, December 31, 1895, with the number 6500; thence running to the Klehini (or Klahela) River in the direction of the peak north of that river marked 5020 on the aforesaid United States map and 5025 on the aforesaid British map; thence following the high or right bank of the said Klehini River to the junction thereof with the Chilkat River, a mile and a half, more or less, north of Klukwan; provided that persons proceeding to or from Porcupine Creek shall be freely permitted to follow the trail between the said creek and the said junction of the rivers into and across the territory on the Canadian side of the temporary line wherever the trail crosses to such side, and, subject to such reasonable regulations for the protection of the revenue as the Canadian government may prescribe, to carry with them over such part or parts of the trail between the said points as may lie on the Canadian side of the temporary line such goods and articles as they desire without being required to pay any customs duties on such goods and articles, and from said junction to the summit of the peak east of the Chilkat River, marked on the aforesaid map No. 10 of the United States Commission with the number 5410, and on the map No. 17 of the aforesaid British Commission with the number 5490.

"On the Dyea and Skaguay trails, the summits of the Chilkoot and White passes.

"It is understood, as formerly set forth in communications of the Department of State of the United States, that the citizens who are subjects to either power found by this arrangement within the temporary jurisdiction of the other shall suffer no diminution of the rights and privileges which they now enjoy.

"The government of the United States will at once appoint an officer or officers, in conjunction with the officer or officers to be named by the government or Her

Britannic Majesty, to mark the temporary line agreed upon by the erection of posts, stakes, or other appropriate temporary marks."

The following proposition from Canada for a permanent settlement of the boundary question was delivered to Ambassador Choate in London, October 24:

"That the boundary line be arbitrated upon terms similar to those imposed by the United States and Great Britain over Venezuela, particularly those provisions making fifty years' occupancy by either side conclusive evidence of title; occupancy of less than that period to be taken as equity allows under international law.

"That as a condition precedent to and absolutely preliminary to arbitration, Skaguay and Dyea would be conceded to the United States without further claim if Canada received Pyramid Harbor."

By this arrangement Canada would give up much of the disputed gold country in exchange for a seaport, but insists upon getting the latter before agreeing to arbitration of the boundary issue. At the close of the year the *modus vivendi* was still in force, the duties of the commissioners were uncompleted, but no further sessions had been held.

Nature of the Dispute.—The articles of the treaty of 1825, whose interpretation has been the chief cause of dispute, are 3 and 4. They read as follows:

"Article III.—The line of demarcation between the possessions of the high contracting parties, upon the coast of the continent and the islands of America to the northwest, shall be drawn in the manner following: Commencing from the southmost point of the island called the Prince of Wales Island, which point lies in the parallel of 54° 40', north latitude, and between the 131st and 133d degree of west longitude (meridian of Greenwich), the said line shall ascend to the north, along the channel called the Portland Channel, as far as the point of the continent where it strikes the 56th degree of north latitude; from this last mentioned point the line of demarcation shall follow the summit of the mountains situated parallel to the coast, as far as the point of intersection of the 141st degree of west longitude (of the same meridian), and finally from the said point of intersection, the said meridian line of the 141st degree, in its prolongation as far as the Frozen Ocean, shall form the limit between the Russian and British possessions of the continent of America to the northwest.

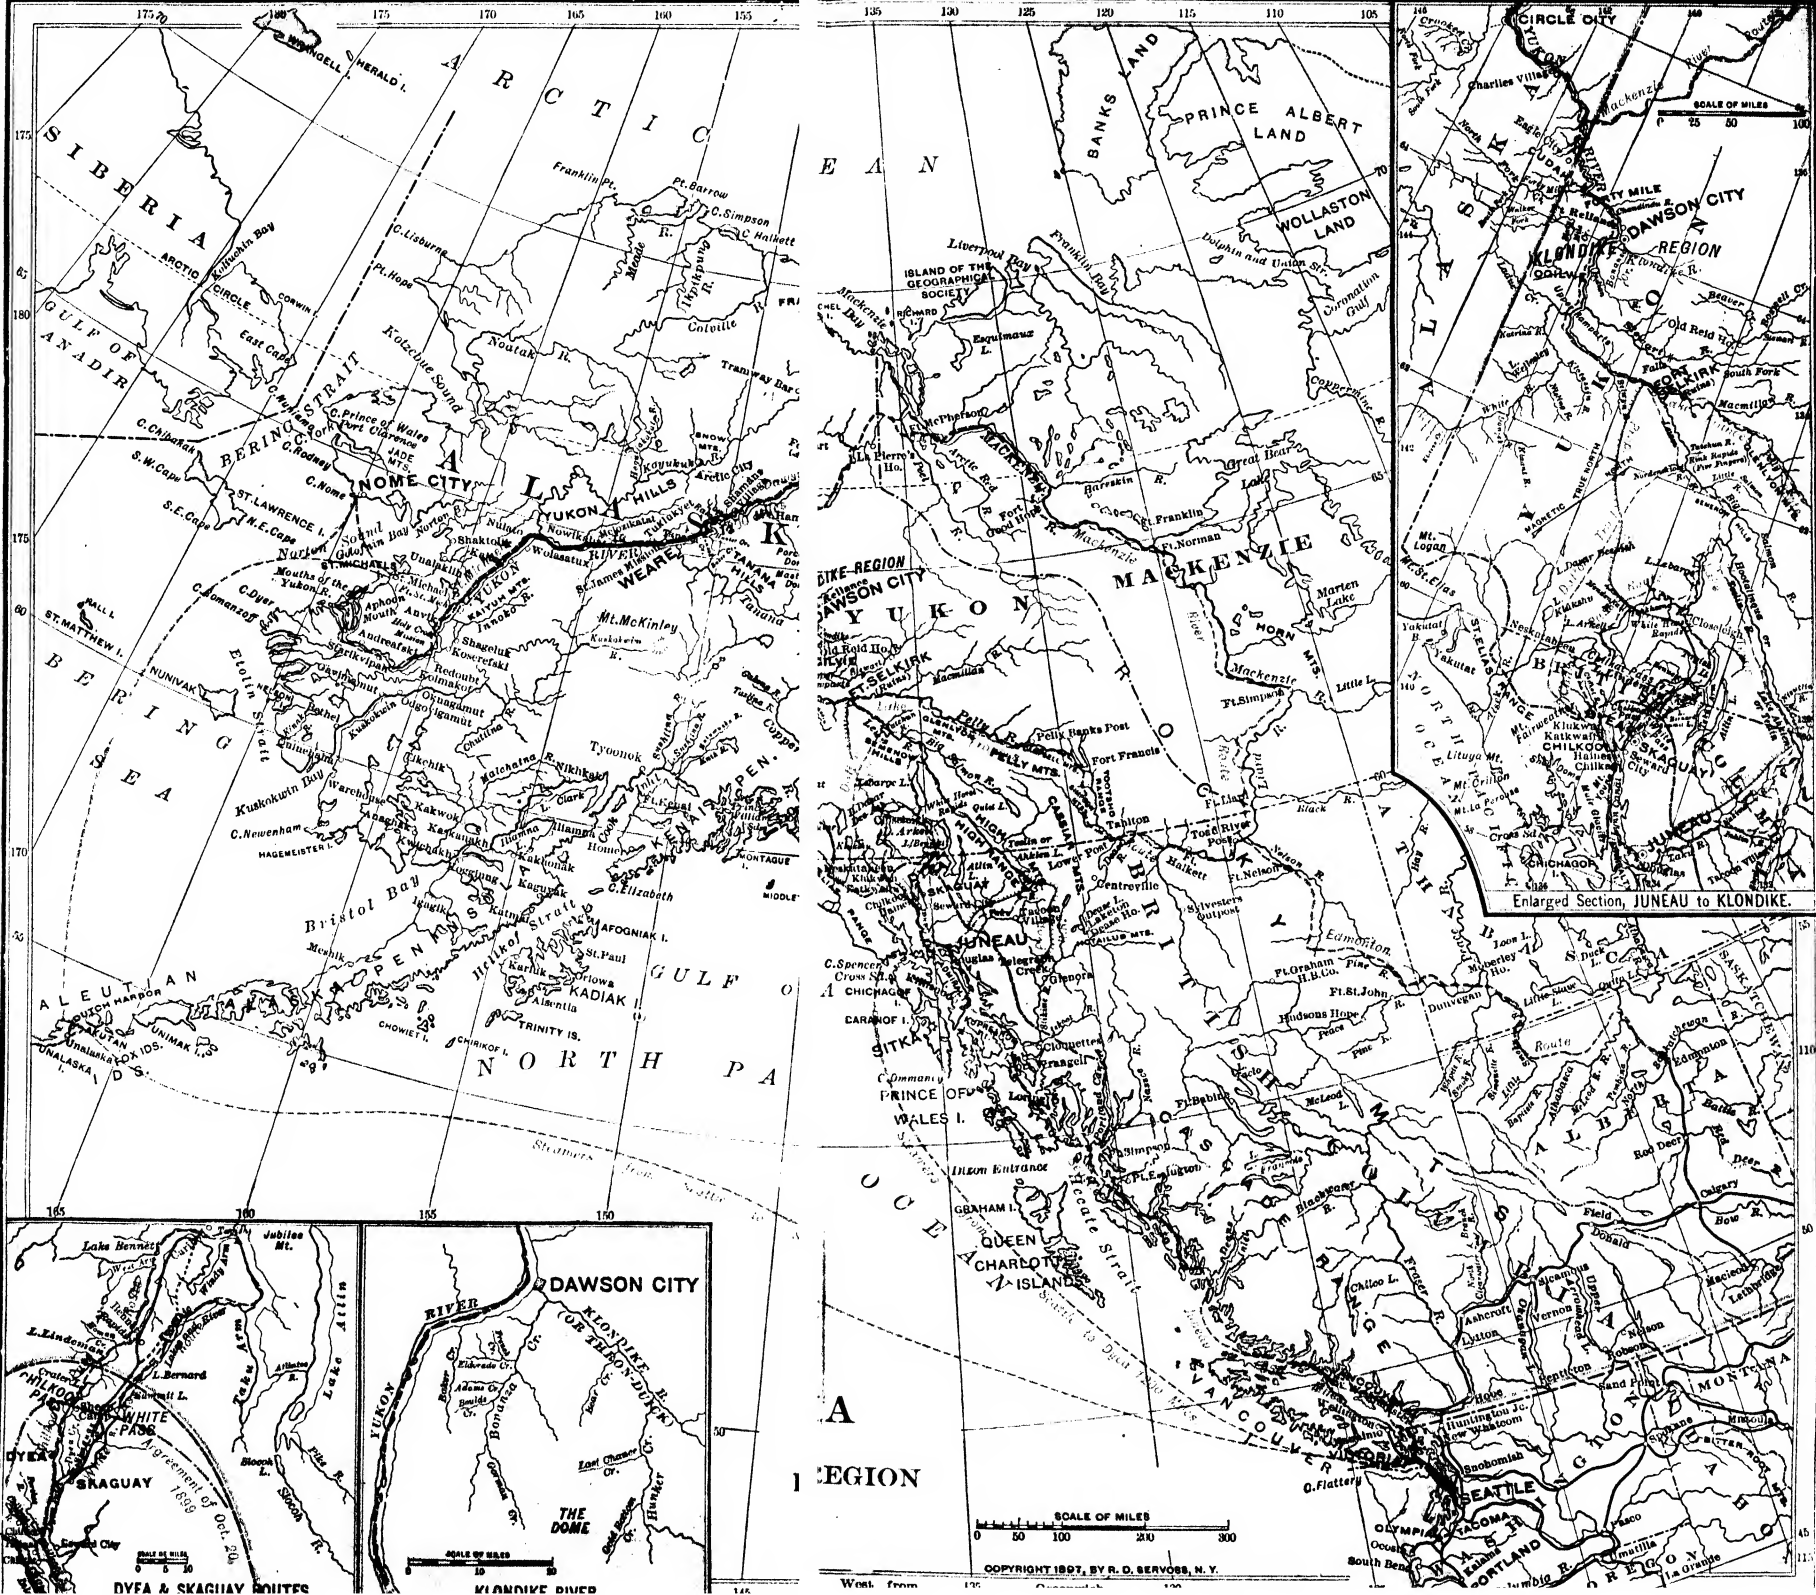

"Article IV.—With reference to the line of demarcation laid down in the preceding article, it is understood—First. That the island called the Prince of Wales Island shall belong wholly to Russia. Second. That wherever the summit of the mountains, which extend in a direction parallel to the coast, from the 56th degree of north latitude to the point of intersection of the 141st degree, shall prove to be at the distance of more than ten marine leagues from the ocean, the limit between the British possessions and the line of coast which is to belong to Russia as above mentioned, shall be formed by a line parallel to the windings of the coast, which shall never exceed the difference of ten marine leagues therefrom."

The dispute has turned principally upon the interpretation of the words "a line parallel to the windings of the coast." The claim of the United States rests upon a literal acceptance of these words, assuming that the coast-line follows the windings of the coast even to the head waters of the longest inlets, while England and Canada have refused to admit that these inlets are ocean waters and have claimed that the coast-line should follow an imaginary line drawn across their mouths. In the case of the Lynn Canal, which is important as the natural entrance to the gold-bearing district of the Yukon, the United States claimed that the boundary line follows the summit of the mountain range which lies nearest to the head of the canal, thus including in United States territory the towns of Dyea and Skaguay, which lie about twenty miles inland, while the British claim would trace the boundary at a distance of thirty miles from the mouth of the canal, leaving these towns in Canadian territory. There were other points of the treaty in dispute, but this was the most important. The strength of the United States claim rested on the fact that the United States government remained in possession and for many years encountered no serious objection on the part of its rivals. Apparently the matter was not controverted at all until the 70's, when the discovery of gold in the southern part of British Columbia stimulated immigration to that region, whose natural outlet was within the territory claimed by the United States. In 1872 the legislative assembly of British Columbia passed a resolution requesting the government of the Dominion to take steps for the definition of the boundary. But nothing was done in the matter, and the United States continued in control. No formal protest appears to have been made by the Dominion government, although attempts were made to survey the region, and the 141st meridian, which marked the easternmost boundary of Alaska, was laid down. America's possession seems in fact to have been recognized, for the application of one Captain Moore, a British subject, to pre-empt 160 acres of land on the site of what is now Skaguay, was refused by the government Land Office in Victoria, on the ground that the land was not under the Dominion

laws and that the application must be made to the government at Washington. The Americans took their stand upon the principle of a long possession which was practically undisputed, saying that the matter had not been seriously questioned until after the rush to the Klondike in 1896. They maintained in effect that since no strenuous denial of America's claims had been made by the Canadian authorities in all these years, the latter were debarred from pressing the matter at the present time. American citizens had settled there and the country had been administered under American laws. Applications for the right of pre-empting land were made to the American government, and no serious doubt had apparently arisen until the discovery of gold in the Yukon. The Canadians on the other hand took their stand on the treaty of 1825, according to which they said that the head waters of the Lynn Canal belong to them. The fact of possession did not in their opinion affect the justice of their claim, which was at least a fit subject for arbitration. In the view of Americans it was no fit subject for arbitration, since such a course would risk the loss of territory which had been occupied by and tacitly recognized as belonging to Americans. The Canadians made some concession to this feeling by admitting that the arbitration should be based on the same principle as that in the case of Venezuela—that is, that the rule should be observed that title should be made good by an adverse holding or prescription of fifty years—political administration being regarded as sufficient to constitute such a holding even when the land was not actually settled. This was the status of the question when it came up before the Anglo-American Commission, which it was hoped, would come to a satisfactory agreement upon it, but this commission adjourned without having accomplished anything on this point. Americans were censured because they were unwilling to apply to themselves the principle which they had insisted upon in the case of Great Britain's controversy with Venezuela, but it has been pointed out that the cases are not comparable, since the Alaskan lands in dispute lie so much nearer to American territory and since the feeling in the United States ran so strongly against the abandonment of lands which had been settled by American citizens and whose administration had so long been in the hands of the American authorities. Whatever may be the value of these considerations from the point of view of logic, they are practically of the highest importance, for the public opinion in the United States was far more decided on this matter than it was in England in respect to the Venezuelan question. The award of the Venezuelan arbitration was a matter of comparatively little concern to the great mass of Englishmen, and they would probably have acquiesced in a verdict however adverse. In the Alaskan affair, on the other hand, a decision against the interests of the United States would have provoked the most serious opposition in that country and might have prevented the Senate from accepting the award. In England the interest in the Alaskan matter has not been very marked, but in Canada there have been many signs of strong resentment toward the policy of the United States in refusing to leave the matter to arbitration. The United States has in fact set its face decidedly against the surrender of any of its tide-water settlements in the disputed territory, yet it has not shown itself altogether unwilling to compromise. One compromise that has been proposed is the placing of Skaguay under the joint administration of Canada and the United States and the internationalization of the White Pass and the Yukon Railroad. The Americans were also willing to permit the transit of munitions of war along this railroad in order to meet the complaint of the Canadians that under present conditions they were prevented from quelling by force of arms any disturbance which might arise in the Yukon district.

The American Position.—The American claim is presented in greater detail in an article by Professor J. B. Moore, published in October, 1899, of which the following is a brief summary: The most important point is the explanation of the expression "a line parallel to the windings of the coast," since the position of this line would determine the width of the strip along the coast which belonged to Russia under the treaty of 1825, and was therefore included in the purchase of 1867. The United States government, as has already been said, took this expression as meaning that the purpose of the treaty was to give Russia the control of all the coast of the mainland, including its indentations, and that the term "windings" included the heads of the inlets. Canada, on the other hand, claimed that the line was not meant to follow the actual windings of the coast, but to follow the general trend of the coast, cutting across the headlands of some of the bays and inlets, especially in the Lynn Canal, and giving Great Britain access to tide-water. The attitude of Russia and England at the time of the negotiation of the treaty throws light on the meaning of the articles in question, and this attitude is regarded as favorable to the claim of the United States. In the first place, it appears that the British government had its mind chiefly on the limitation of Russia's claim in 1821 to an exclusive jurisdiction over the Pacific Ocean, George Canning, the British secretary of state for foreign affairs, having expressly declared: "It is not on our

part essentially a negotiation of limits. It is a demand of the repeal of an offensive and unjustifiable arrogation of exclusive jurisdiction over an ocean of unmeasured extent." By settlement of limits it was expected that this claim would be overthrown for all time. The geography of the region was but partially known, and whether or not the mountain formed an unbroken line along the coast had not been ascertained. For that reason a general rule had to be adopted, instead of following the crest of the mountains, which might at any point run inland for an indefinite distance. The British representative first proposed, in 1823, that Cross Sound, lying about the latitude of $57^{\circ} 30'$, should form the boundary on the coast, and the meridian line drawn from the head of Lynn Canal should form the boundary in the interior. This was refused, and the British government then proposed a line through Chatham Straits to the head of Lynn Canal, thence northwest to the 140th degree and along that degree to the Polar Sea. Russia, rejecting this, offered as a counter-proposition that the 55th degree of north latitude should be taken as the southern limit, and that the line should "follow Portland Channel up to the mountains which border the coast" and from that point "ascend along those mountains, parallel to the sinuosities of the coast, as far as the 139th degree of longitude (meridian of London)," and thence along that meridian to the north. The instruction which the British ambassador received from the government shows that the latter's main purpose was to prevent an extension of the Russian posts beyond a certain limit in the interior, lest it should break the continuity of the British territory. Russia's design, on the other hand, was to secure a base of support for the Russian-American Company by keeping control of a strip of territory along the coast, and, as an inducement to Great Britain to accept the line, the Russian government declared that British subjects should enjoy the free navigation of all the rivers which emptied into the ocean through this strip of coast. The British government objected to this on the ground that it would deprive Great Britain "of sovereignty over all the inlets and small bays lying between latitudes 56° and $54^{\circ} 45'$, whereof several (as there is every reason to believe) communicate directly with the establishments of the Hudson's Bay Company, and are consequently of essential importance to its commerce." Great Britain next proposed a line, which would give Prince of Wales Island to Russia, but cut her off from the adjoining coast of the mainland, and this proposal was rejected by Russia on the ground that the possession of Prince of Wales Island without a portion of the coast lying in front of that island could be of no utility whatever to Russia. Russia insisted upon the Portland Channel as the boundary of the southern portion of the line, but proposed that the eastern boundary should extend along the mountains which follow the sinuosities of the coast. After some discussion of the possible danger involved in assuming that the mountains always conformed to the windings of the coast, the compromise expressed in the last sentence of the fourth article was reached, and it was provided that the line should at no point be at a greater distance than ten marine leagues from the coast. On the maps which were in use for many years the line followed the windings of the coast, running around the heads of the inlets, and a further sign that this territory was regarded as belonging to Russia is the fact that the Hudson's Bay Company leased the greater part of this strip from the Russian government for many years after 1839. A line through the Portland Channel continued to be the undisputed boundary until about 1873, when some Canadian writers suggested that it should follow the Behm Canal, or take some other course than through the Portland Channel. The grounds for this were that by the terms of the treaty the line was to "ascend to the north" from the southmost point of Prince of Wales Island, while, in order to enter Portland Channel, it has to run to the east; and, secondly, that Portland Channel does not extend as far north as 56° north latitude, as is stated in article 3. In reply to these objections, it has been said that they seem to demand a greater accuracy and minuteness than the framers of the treaty had meant to employ. The language is a little loose, but its meaning is clear. The negotiators could not have meant the expression "ascend to the north" as requiring the line to run directly north from the southmost point of Prince of Wales Island, since in that case it would have deprived Russia of a portion of the island. Again, it is equally clear that the essential point of the words, "the said line shall ascend to the north, along the channel called the Portland Channel, as far as the point of the continent where it strikes the 56th degree of north latitude," was the requirement that the line should run to the 56th degree of north latitude, through the Portland Channel so far as that channel extended. The previous discussion has shown that Russia insisted upon the Portland Channel, and that Great Britain repeatedly tried to secure a different southern boundary, and that Russia's demand in this particular was finally granted. It appears, too, that Russia regarded the retention of this strip of coast as a return for giving up certain claims of jurisdiction and for making certain concessions in respect to trade, and also that the reason for her insistence

upon it was her desire to secure a protective base on the coast of the mainland for the establishments of the Russian-American Company on the adjoining islands.

ALBATROSS EXPEDITION. See ZOOLOGICAL STATIONS (paragraph Albatross Expedition).

ALCOHOL. *Consumption of Alcoholic Beverages in Various Countries.*—The most recent statistics give the average annual consumption in gallons of alcoholic beverages per individual as follows: England, beer, 30.31; wine, 0.39; spirits, 1.02; France, beer, 5.01; wine, 21.8; spirits, 1.84. Germany, beer, 25.5; wine, 1.34; spirits, 1.84. United States, beer, 12.3; wine, 0.44; spirits, 0.84. The consumption of whiskey in Great Britain for the fiscal year ending March 31, 1899, aggregated 34,334,421 gallons, or 0.852 of a gallon per inhabitant. Nine years before, the total reached was 29,850,523 gallons, or 0.747 of a gallon per capita. Besides this amount of proof-standard whiskey, there was a large amount of spirit manufactured for export, as well as methylated spirit, the total production by the distillers reaching the sum of 63,437,844 gallons. France, of all the European nations, consumes the largest amount of alcohol. According to the statistics presented at the Anti-Alcohol Congress, held in 1899, at Nantes, the requirements of France reach 14.19 litres of 100 per cent. alcohol annually for each inhabitant. In contrast with this figure, the Belgians and Germans were reported to consume yearly 10.50 litres per capita; the English, 9.25 litres; the Italians, 6.60 litres; the Swedes, 4.50 litres, and the Canadians, 2 litres per head.

Alcohol and Public Health.—It has been stated that the birth-rate diminishes in proportion as alcoholism increases. If this be true, the increase in the consumption of alcohol in France may account in part for her decreased birth-rate. Increase in insanity has been observed to keep pace with the increase in alcoholism in France. In 1838 there were about 15,000 inmates in the insane asylums of France. To-day there are about 100,000. In Paris alone the annual number of cases of insanity has increased from 7805 to 21,700 in thirty years. The cause assigned in 25 per cent. of these cases has been alcoholism. Suicides in France having their origin in alcoholism are becoming very frequent. In the North Department of that republic these suicides have increased sixfold. Dr. F. C. Busch, of Berne, is authority for the statement that statistics collected in 1899 from the fifteen largest cities of Switzerland, the population of which varies from 12,000 to 163,000, give the yearly average of deaths from all causes for the period from January 1, 1891, to January 1, 1898, as 7257. Of these, 465 deaths were ascribed as due to alcoholism. The highest percentage of deaths from this cause occurred in males between the ages of 40 and 59, at a time when a father is most needed by his family. Statistics for the first three months of 1898 showed a percentage from this cause of 15.1 of all deaths. The inmates of the twenty State insane asylums numbered 6164, while the population of Switzerland is a little over 3,000,000.

Influence of Season upon Alcoholism.—At the Seventh International Congress Opposed to the Abuse of Spirituous Liquors, held at Paris in April, 1899, Baer discussed the subject of season and drunkenness. He attributes the special prevalence of drunkenness in the summer season to a combination of influences, including, among others, the increased thirst due to the heat; the long days of mild weather, during which people meet more freely out of doors in social relations; the retarded bodily metabolism and deficient elimination of alcohol, and the fact that possibly the relaxation and fatigue of the brain peculiar to the heated term renders this organ more susceptible to the influence of alcohol. Somewhat at variance with Baer's theory is the fact that drunkenness is more common in cold and temperate countries than in the tropics. It is also more prevalent in damp than in dry climates. Baer mentions that suicide is more common in summer than at other seasons, as well as crimes against the person. The remedy suggested is the provision of suitable substitutes for alcoholic beverages during the heated term.

Alcohol in Therapeutics.—In an article published in Germany in June, 1899, Dr. R. Rosemann reviews the investigations of Riess, Stammrich, Miura, and Schmidt, which fail to show that alcohol controls in any way the loss of proteids. Until recent times alcohol has been considered by laity and faculty as a valuable nutriment, especially in acute fevers and other cases where there is rapid destruction of tissue and the desire exists to control this destruction by administering nourishment that is readily oxidizable. Rosemann made an experiment upon a well person, which satisfied him that alcohol causes a lessening to a very small degree of the daily loss of nitrogen under exhausting conditions; that alcohol controls the loss of fat to a considerable degree, and that the patient, while apparently remaining well nourished, is constantly losing muscle.

Alcohol and Crime.—Professor Pellmann, of the University of Bonn, has recently published the results of his investigations regarding the descendants of Ada Jurke, a chronic alcoholic, born 1740 and died 1800. Of her descendants, 7 were murderers,

76 committed other crimes, 144 were professional beggars, 61 were charges on public charity, and 181 were prostitutes. This family is said to have cost the German government \$1,200,000.

A recent interesting work on alcohol, presenting an earnest attempt to indicate the dangers of alcohol, and withal containing much interesting information, is *Shall We Drink Wine?* by Dr. John Madden, Milwaukee, 1899. See MARRIAGE, MEDICAL CONTROL OF.

ALEXANDER, Sir CLAUDE, major-general, died May 23, 1899. Born in London on the 15th of January, 1831, he was educated at Eton and at Christ Church, Oxford, and in 1849 entered the Grenadier Guards. He served in Crimea, being present at the siege and fall of Sebastopol. From 1874 to 1885 he sat in Parliament for South Ayrshire. He was created a baronet in 1886.

ALFRED, Prince, son and heir of the Duke of Saxe-Coburg and Gotha, Germany, and the grandson of Queen Victoria, died February 6, 1899, at the age of 25 years. His father is the second son of Queen Victoria and his mother the Grand Duchess Marie of Russia, daughter of the late Alexander II. of Russia. Prince Alfred was a captain of Prussian infantry and was unmarried. Through his death Prince Arthur, of England, Duke of Connaught, the third son of Queen Victoria, became the heir to the reigning dukedom of Saxe-Coburg. It was officially announced, however, on June 30, 1899, that the Duke of Connaught and his son, Prince Arthur, had renounced their claims to the succession in favor of the young Duke of Albany, son of the late Prince Leopold of England. The right to the succession is reserved by the Duke of Connaught in the event of the death of the Duke of Albany, or the extinction of the latter's male line.

ALGER, HORATIO, clergyman and famous writer of stories for boys, died at Natick, Mass., July 18, 1899. He was born at Revere, Mass., January 13, 1834. The three years succeeding his graduation at Harvard in 1852 were given to journalism and teaching. He subsequently passed three years at the Cambridge Divinity School, continuing at the same time his contributions to the press. In 1861 he travelled in Europe, and returning to Cambridge was engaged in private tutoring until 1864. In December of this year he was ordained pastor of the Unitarian Church at Brewster, Mass.; two years later went to New York, where he became interested in the social condition of street boys. It is probable that his observation here in large measure contributed to his subsequent writing of boys' stories. He lived in New York until 1896. Alger was a frequent contributor to periodical literature. His published volumes number about seventy, of which nearly 800,000 copies have been sold. These writings include the *Tattered Tom* series, the *Ragged Dick* series, the *Atlantic and Pacific* series, and the *Luck and Pluck* series. Among the individual titles of his works the following may be mentioned: *Bertha's Christmas Vision*, 1855; *Nothing to Do: A Tilt at our Best Society*, 1857; *Frank's Campaign; or, What a Boy Can Do*, 1864; *Paul Preston's Charles*, 1865; *Helen Ford, Adrift in the City*, 1895; *Frank Hunter's Peril*, 1896. He also wrote a volume of poems and lives of Webster, Lincoln, and Garfield.

ALGERIA, a French colony on the northern coast of Africa with an area of 184,474 square miles and a population, in 1896, of 4,429,421. The southern limits are somewhat loosely defined. The portion of the Sahara within these limits is estimated at 123,500 square miles, with a population of 50,000. One of the striking facts in regard to Algeria is that although the French have held the country since 1830 the size of the French element in the population is exceedingly small. In 1896 there were 318,137 French inhabitants, including naturalized citizens, while the foreign unnaturalized population numbered over 400,000. This fact has given rise to much discussion as to the probability that the alien element would finally dominate the country and some have even proposed a change in the electoral law which would prevent the foreigner from gaining this influence. The French and naturalized citizens have numbered at the last three censuses 219,071 in 1886; 272,662 in 1891, and 318,137 in 1896. The foreigners not naturalized increased only from 203,154 in 1886 to 211,580 in 1896, but a large part of the foreign element was included under the naturalized citizens. In the department of Oran it is estimated that four-fifths of the foreign population was composed of other elements than French. The commerce of Algeria is almost exclusively with France, but a large part of the imports pass by way of Algiers and through the desert into the Soudanese territory to the south of the Sahara. The chief articles of export are rushes, reeds, cork, iron ore, manufactured tobacco, tan bark, fodder, skins, and horses, and the principal imports are coffee, cattle, cotton, textiles, cereals, coal, tobacco, wood, and machinery. The value of the imports in 1897 was \$11,716,000, and of the exports \$9,601,000. This is exclusive of commerce with France, which in that year was as follows: Imports, \$45,412,900; exports, \$47,478,000. The chief sharer in the foreign trade of Algeria,

exclusive of France, was Great Britain. The chief products are barley, wheat, oats, olive oil, wine, tobacco, wool, iron, zinc ores, and phosphates. The minerals include lead, mercury, copper, and antimony. Petroleum occurs in Oran, and there are phosphate beds in some parts of the country. The wine production has shown a steady increase in recent years, amounting in 1898 to 140,000,000 gallons as compared with 12,000,000 gallons in 1880. Algeria is under a governor-general, who is in direct communication with the French executive, but the country is not regarded as a colony and has a distinct government of its own, with departments of finance, worship, justice, instruction, and customs, and a representation in the French National Assembly, to which it sends one senator and two deputies. The length of the railways is 2156 miles. The chief sources of revenue are direct taxes, customs, registration, stamps, and monopolies, and the main items of expenditure are included under the heads of ministries of the interior, public works, justice, worship, and instruction. The revenues regularly fall short of the expenditures, and the French government makes appropriations to meet the deficit.

ALLEN, CHARLES GRANT BLAIRFINDIE, was born in Canada in 1848, and died at London October 25, 1899. Grant Allen, as he was known from childhood, had a remarkably fertile literary career. For over twenty years he continued to produce volumes and magazine articles innumerable, varying in subject from light fiction to such weighty works as his *Evolution of the Idea of God*, published in 1897. As a novelist Grant Allen earned a well-deserved popularity. His *Philistia* and his *Babylon*, written respectively in 1884 and 1885, were such financial successes as to bring him a very large income, and they were the first of a long line of similar books. His success as a novelist was not altogether satisfactory to him, and he is said never to have been able to rid himself of the habit of looking with a kind of contempt on the art of novel writing. He frankly confessed in one of his collections of literary experiences that science was his only love, and fiction a pecuniary resource useful only from the standpoint of financial income. Yet his fame among readers at large may last longer on account of his novels than because of his philosophical and scientific works, in spite of his own preferences. His serious works were by no means dry, however. Indeed, they received an æsthetic treatment which made them very readable. And though in later years Grant Allen did devote more and more time to novel writing, he published many thoughtful studies on subjects on which he had not written before. Mr. Allen was a student of nearly all branches of knowledge and he was on terms of intimate friendship with many of the famous authors and artists of Great Britain. His *Physiological Aesthetics*, 1887, was dedicated to Herbert Spencer. In art his sympathies were with the pre-Raphaelites, and among artists Rossetti, Burne-Jones, and Holman Hunt were his friends. Of the long list of his productions the following may be mentioned: *Physiological Aesthetics*, *The Colour Sense*; *The Evolutionist at Large*; *Charles Darwin*; *The Colour of Flowers*; *Flowers and their Pedigrees*; *Force and Energy*; *Vignettes from Nature*; *Philistia*; *Babylon*; *Colin Clout's Calendar*; *For Maimie's Sake*; *In All Shades*; *The Beckoning Hand*; *The First Book*; *The Devil's Die*; *This Mortal Coil*; *White Man's Foot*; *The Tents of Shem*; *The Woman Who Did*; *Post-Prandial Philosophy*; *Strange Stories*, *Anglo-Saxon Britain*; *The British Barbarians*; *Science in Arcady*; *Miss Cayley's Adventures*; *The Evolution of the Idea of God*, and historical guides to Paris, Florence, Belgium, and Venice.

ALMA-TADEMA, SIR LAWRENCE, who was knighted in 1899, was born at Dronryp in the Netherlands January 8, 1836. He became a British subject in 1873, when he obtained letters patent of denization. His last work, "The Baths of Caracalla," was exhibited in 1899. He was also the English representative in the Vandyke festival at Antwerp. His home is in London.

ALSACE-LORRAINE, a territory acquired by Germany from France as a result of the war of 1870, now forms the Reichsland or imperial land of the German Empire, the German constitution having been introduced into the district on June 1, 1874. It has an area of 5601 square miles, with a population in 1895 of 1,640,986. The chief towns are Strasburg, the capital, with 135,608 inhabitants in 1895; Mülhausen with 82,986, and Metz with 59,794. In recent years attempts have been made to promote the industry and trade of the country and an industrial exhibition was held at Strasburg in 1895. In 1898 and 1899, however, it was reported that certain industries, especially the textile industries, were showing signs of decline. The exports of textile goods to the United States fell off rapidly, and the same movement was reported to be in progress in 1899. The administration is in the hands of a governor-general with the title of *Stadthalter*, Herman von Hohenlohe-Langenburg, appointed in 1894. He is the representative of the imperial government. Associated with him are the secretary of state, and a council of state, which consists of these two officers together with the principal provincial officials and from eight to twelve other members appointed by the Emperor. In 1890 there was much

discussion over the growing friendliness between France and Germany on the ground that it seemed to imply a disposition on the part of the former country to give up her long-cherished ambition for the recovery of Alsace-Lorraine, but the general opinion seemed to be that an *entente* between France and Germany upon matters in which the interest of both powers were identical would in nowise involve any ulterior designs which France might have upon Alsace-Lorraine.

ALUMINIUM. The production of the metal in 1898 amounted to 5,200,000 pounds, which was an increase of 30 per cent. over 1897, and 300 per cent. over 1890. In fact, the production has increased each year since the beginning of the industry in 1883. Bauxite still continues to be the important ore of aluminium, and the production in 1898 amounted to 25,149 long tons, valued at \$75,436. The output has increased steadily since 1893, and continues to come entirely from Georgia and Alabama. Some of the deposits in that region have given out, but on the other hand new ones have been discovered. During 1899 considerable exploiting was done in the Arkansas bauxite region, and a small amount shipped East.

AMHERST COLLEGE, at Amherst, Mass., had a quiet but progressive year. The important event in the year's history was the choice of a new president in Dr. George Harris, of Andover Theological Seminary, an alumnus of Amherst. Dr. Edward Hitchcock served during the year as dean of the faculty, and at the following commencement he received from the college the degree of LL.D., and from the alumni a loving cup containing a bag of gold eagles "in grateful appreciation of his thirty-eight years of service to the college." The new treasurer of the college, Mr. J. W. Fairbanks, was active in promoting its welfare. No large gifts were received during the year. The Eno bequest of \$50,000 was paid in, and also \$10,000 from the Fayerweather estate. The movement begun by the class of 1884 to raise a fund of \$100,000 for a new college hall seems likely to result at an early date in a suitable assembly hall, which is much needed. A course on "Modern Governments and Their Administration" was opened under the direction of Professor E. A. Grosvenor, which will be developed and made a permanent feature of the curriculum. The additions to the library have been less than in previous years, amounting to 1553 volumes, making the total number now in the library 71,780. For statistics, see UNIVERSITIES AND COLLEGES.

ANÆSTHESIA. During 1899 the claims for the Schleich mixture (ether, chloroform, and benzine) have not been substantiated. Most anæsthetists who have used it agree that in cases in which it is used the percentage of cyanosis is high, and in several cases broncho-pneumonia has followed. The resultant vomiting has been about the same as that following ether. It is claimed that the after-nausea and vomiting, which are sometimes very depressing, and occasionally dangerous, may be prevented by the inhalation of vinegar immediately after the ether or other anæsthetic is discontinued. The resident physician of the Bay View Hospital of Baltimore, Md., reports that this use of vinegar has been successful in preventing nausea and also thirst, in about 97 per cent. of cases, during the past four years. Nitrous-oxide gas has been used increasingly during 1899 for examinations, removal of sutures, incision of abscesses, removal of tonsils and adenoids, reducing dislocations and fractures, and small operations, as well as a preliminary in the administration of ether or chloroform. It is safe and rapid, and leaves no after-

effects. It has the great disadvantage of not relaxing the muscles as other anæsthetics do. Early in the year Professor August Bier, of Kiel, introduced a method of producing extensive anæsthesia without unconsciousness by the introduction of a solution of cocaine (usually 0.5 of 1 per cent.) into the vertebral canal. The anæsthetic effects are believed to be produced by the action of the drug upon the nerves without sheaths and the ganglia which are found within the spinal canal. He has used this method in six major operations without any suffering to the patient or after-effects. Anæsthesia of the entire lower extremities and of most of the abdomen was secured in eight or ten minutes after the injection of about 0.005 of a gramme of the drug. In *Centralblatt für Chirurgie*, 1899, vol. xxvi., p. 1110, Seldowitsch reports the successful use of this method of anæsthesia in four major operations, in each of which he employed about 0.01 of a gramme of cocaine. The anæsthesia was sufficient for the completion of each operation, the longest lasting fifty minutes. A short time after the completion of each operation normal sensation returned. One patient, from whom a cancer had been removed, died of cancer five weeks after operation. Examination of the spinal canal revealed that no harm had been done by the lumbar puncture. See ACORN.

ANAM or ANNAM, a French dependency in Indo-China. It was formerly an empire, and its king was the feudal vassal of the Emperor of China, but, having appealed to France for protection in 1862 in order to put down a revolt in his dominions, he afterward had to give up several of his provinces to the French, and in 1884 his territory became a French protectorate. Anam is the official designation of the strip of land along the coast of the China Sea, with an area of about 81,042 square miles, and a population variously estimated at from 2,000,000 to 6,000,000. Its limits are ill-defined, but in 1893, by a convention with Siam, the river Mekong was taken as the western boundary. It is under the superior council of Indo-China, which advises as to the budget, and, with the other French possessions in Indo-China, it has been united since 1887 in a customs union. The interior affairs are administered by native officials under the control of the French government. The king is Thanh Thai, who was proclaimed in 1889. France receives the customs revenue. Three of the ports are open to European commerce. There is an army of 23,370, of whom 14,500 are natives. The work of the missionaries, which has been carried on for many years, has proved effective, and it is estimated that there are 420,000 Roman Catholics in the country. The Anamites occupy the towns and the coast lands, and tribes of Moïs are in the hill districts. Among the products are rice, maize, and other cereals, tobacco, sugar, cinnamon, mulberry, betel, manioc, the arca-nut, caoutchouc, dye, medicinal plants, bamboo, and other valuable timber. The manufactures include raw silk, crape, and earthenware. There are mines of iron, copper, zinc, and gold worked by the natives. The chief exports are sugar and cinnamon, and the chief imports are cotton goods, tea, petroleum, paper, and tobacco. The capital is Hué, with a population of 30,000. A garrison of French troops occupies a portion of the citadel. See INDO-CHINA.

ANATOMISTS, ASSOCIATION OF, AMERICAN, organized in 1888, in 1899 had 131 active and 10 honorary members. President, George S. Huntington, M.D.; secretary, D. S. Lamb, M.D., 800 Tenth Street, N. W., Washington, D. C. Annual meeting for 1900 at Washington, May 1-3.

ANCIENT ACCEPTED SCOTTISH RITE MASONS, the Supreme Council of Sovereign Grand Inspectors-General of the Thirty-third and Last Degree, had, on October 1, 1899, in the Northern Masonic Jurisdiction of the United States, a membership aggregating about 100,000, and the Permanent Fund and amount in treasurer's hands exceeded \$200,000. Grand commander, Henry L. Palmer, Milwaukee, Wis.; grand secretary-general, Clinton F. Paige, Binghamton, N. Y. Officers of the Southern Masonic Jurisdiction: Grand commander, Thomas H. Caswell, San Francisco, Cal.; grand secretary-general, Frederick Webber. 433 Third Street, N. W., Washington, D. C.

ANDREW AND PHILIP, BROTHERHOOD OF, organized in 1888, and in 1899 had 500 chapters, with 15,000 members distributed among 21 religious denominations. The *Brotherhood Star* is the organ of this society. President, the Rev. Dr. Rufus W. Miller; secretary, the Rev. C. E. Wyckoff, Irvington, N. J.

ANDREWS, General GEORGE LEONARD, died April 4, 1899, at Brookline, Mass. He was born in that State in 1828; was graduated at the Military Academy, West Point, in 1851. He served in the Civil War, rising to the rank of major-general of volunteers. From 1867 to 1871 he was United States marshal for Massachusetts; in the latter year he became professor of French at West Point, and in 1882 was appointed to the chair of modern languages. He retired in 1892.

ANGLICAN CHURCH, a general term including the Protestant Episcopal churches in all countries which have originated from the established church of

England. See ENGLAND, CHURCH OF; SCOTLAND, CHURCH OF; and PROTESTANT EPISCOPAL CHURCH.

ANGLO-AMERICAN COMMISSION. See CANADA (paragraphs on History).

ANGLO-AMERICAN LEAGUE. The Anglo-American League was formed in London in 1898 for the purpose of securing cordial and constant co-operation between the United States and Great Britain. Chairman of the Executive Committee, James Bryce, M.P.; secretary, Sir Frederick Pollock. Office, 6 King's Bench Walk, Temple, E. C., London, England.

ANGOLA or PORTUGUESE WEST AFRICA lies on the western coast of the continent between the Congo Free State on the north and British Central Africa and German Southwest Africa on the east and south, with an area of 484,800 square miles, and a population estimated at 4,119,000. The capital is St. Paul de Loanda, and other important towns are Cabinda, Ambriz, Benguella, Mossamedes, and Port Alexander. The chief products are coffee, rubber, sugar, vegetable oils, coconuts, and ivory, and in the interior valuable mines of copper, iron, malachite, and salt are said to exist. Gold occurs in portions of the country, and a Portuguese commercial company organized with German capital has received important concessions, and is engaged in developing the mineral resources, especially the Cassinga gold mines, which have been recently discovered. Work is being done in developing the railways, and a line 250 miles long has already been constructed. It extends into the interior toward the line running from Portuguese East Africa westward, with which in time it is expected to unite, thus completing the railway route across the continent. There are also about 200 miles of telegraph line. The administration is in the hands of commissioners appointed by the Portuguese government, and there is a small army of 4000 men, of which 2058 are natives.

ANNENKOFF, General MICHEL, prominent Russian engineer, died in St. Petersburg, January 22, 1899. He was born in that city in 1838; through the influence of his father, also a general in the Russian service, he entered upon a military career. He fought against the insurgent Poles in 1866, and for meritorious services was promoted to the rank of colonel. During the Franco-Prussian War he accompanied the German army as a Russian military attaché. Having returned to Russia, he served under General Skobelev in the Merv campaign. Subsequently assigned to the engineering department, he became famous for his success in completing the great Trans-Caspian railway, begun by General Skobelev. General Annenkoff gave personal attention to the construction of the line between Samarkand and Tashkend. In recent years he was actively interested in the Trans-Siberian railway. It is said that, more than any other man, he was responsible for this great undertaking, and that his skilful setting forth of the plans for the road at Paris in 1891 secured for the enterprise the support of French capital.

ANTARCTIC EXPLORATION. In 1899 arrangements were made for the fitting out of a German Antarctic expedition. In England efforts were made by the Royal Society and the Royal Geographical Society. A private gift of £25,000 and a public subscription of £15,000 more were made for South polar exploration, and government aid was promised. The two expeditions of the year are treated in the following paragraphs.

The Belgian Expedition.—The Antarctic expedition which sailed in August, 1897, from Antwerp, in the 250-ton steam whaler *Belgica*, commanded by Captain Adrien de Gerlache, of the Belgian navy, arrived at Montevideo on its return voyage, April 4, 1899. The party left Punta Arenas, on the Straits of Magellan, December 14, 1897, and just a month later sailed from Staten Island, east of Terra del Fuego, for the South Shetland Islands. Other islands were discovered and the geographical knowledge of the South polar seas was considerably extended. Hughes Bay, on the west side of Palmer Land, was reached on January 24, 1898, and from that date to February 12 an adjacent archipelago was explored. Three species of small insects found here are the first Antarctic land fauna known. On February 16 Alexander I. Land was sighted, but near approach was prevented by an impenetrable ice-floe. On March 3, when a point 71° 31' S. and 85° 16' W. had been reached, the ice made further progress impossible, and for a few days following the *Belgica* drifted in the midst of a mass of ice. On March 10, 1898, the ship was completely blocked, and from that date until March 14, 1899, was imprisoned in the ice-pack. In 1898 the sun set on May 17 and did not rise again until July 24. The members of the expedition were the first men to live within the Antarctic circle during the polar night. On May 30, 1898, the ice-floe surrounding the *Belgica* had drifted so that the ship had reached a point 71° 36' S. and 87° 38' W.; this was the southernmost latitude attained by the expedition. During these months of the south polar winter the heavy snowstorms, the violence of the wind, and the treacherous

An outlet opened in October, 1898, about three-eighths of a mile from the ship. About the 1st of the following January Captain de Gerlache attempted to dig a channel to the outlet, but the latter soon closed up. During these last weeks of her imprisonment the *Belgica* suffered dangerously from ice pressure. When the ice-pack finally opened on March 14, 1899, the ship was a trifle over 70° S. and about 103° W. The land that has been charted as 70° S. and 100° W. was not seen. The ship reached Punta Arenas on March 28 and Montevideo on the 4th of April.

The British Expedition.—The Antarctic expedition, organized by Sir George Newnes and commanded by Mr. Carsten Egebert Borchgrevink, sailed from the

Thames in the wooden vessel *Southern Cross* in August, 1898, and on December 19 stood south from Hobart, Tasmania. On December 30 the first ice was encountered in latitude $61^{\circ} 56' S$. A few days later the ship came in sight of the Balleny Islands, and there was caught in the ice-pack and held for over a month. Having finally pushed through, the party sighted high land on February 15, 1899, and on the 17th reached Robertson Bay, near Cape Adare, Victoria Land, which seems to be not far from $70^{\circ} S$. and $170^{\circ} E$. The landing was rendered dangerous by heavy gales, but equipments, provisions, building materials, and seventy-five Siberian dogs were safely brought to shore. The construction of a house, which was immediately begun, was completed on February 28, at which time the *Southern Cross*, leaving Mr. Borchgrevink and nine companions, put about for New Zealand, reaching Port Chalmers on March 16. Before the return of the ship three of the party attempted to climb a mountain near at hand, from which a view of the country could be obtained; they could not get above 2300 feet, but found that the country is undulating and covered with glacier ice. While in 1898 the members of the Gerlache expedition were the first to pass the season of the polar night within the Antarctic circle, the Englishmen under Borchgrevink in 1899 were the first to pass the dark season on Antarctic land. As the expedition was thoroughly equipped, both for exploration and for technical scientific research, good results are hoped for. It was expected that the *Southern Cross* would return to Cape Adare in January, 1900.

ANTHRAX. See INSECTS; SERUM THERAPY.

ANTHROPOLOGY IN AMERICA. The increasing interest in anthropology and its allied sciences during the past year, as evinced by the establishment of university chairs of anthropologic instruction, the organization of historical and antiquarian societies, the efforts for the conservation of the ancient monuments, the enlargement of museum facilities, and the substantial donations by wealthy patrons for the furtherance of collection and expeditionary research, has been most gratifying to all students who desire to see the study of man take its proper place in the forefront of the sciences. Many university establishments in the United States now make some provision for regular anthropologic instruction, the most recent additions being Yale, which has instituted a course in anthropology under Professor George Grant MacCurdy, and Columbia University of New York City, where a chair has just been created, filled by Dr. Franz Boas, of the American Museum of Natural History.

One of the important results of the forty-eighth annual meeting of the American Association for the Advancement of Science, held at Columbus, O., in August, was the appointment by Section H of a committee, with Professor W J McGee as chairman, for the special purpose of devising means for the further extension of anthropologic study in the higher educational institutions throughout the country. As ethnologist in charge of the Bureau of American Ethnology, Professor McGee has already done notable work in that direction, not alone in organizing and directing investigation, but also in arousing popular interest in the subject, particularly by the formulating of the science upon a broad working basis in a series of public lectures delivered in the early part of the year at the Iowa State University, in Iowa City. Another important committee appointed at this meeting was that for the conduct of investigations relating to the white race in America. Of special interest was the address of the retiring president, Professor F. W. Putnam, being an argument for distinct racial types in prehistoric America, and a study by Professor Mansfield Merriam upon the increase of variability in the United States. A field excursion was made to the celebrated prehistoric earthworks at Fort Ancient. Memorial proceedings were also held upon the death of Dr. D. G. Brinton. The association adjourned to hold its next annual meeting at New York in June of 1900.

The regular holiday meeting of Section H and the American Folklore Society was held in conjunction with that of the Archaeological Institute of America, and a number of affiliated societies, at Yale University, New Haven. As usual in the joint assemblies, the papers covered a wide range of interest from archaeology and anthropometry down to the lighter folklore.

The South has recently manifested an awakening interest in all that relates to her past. In South Carolina the State Historical Society, which had lain dormant for many years, has taken on new life, and is contemplating the publication of a quarterly periodical, to be filled chiefly from the valuable manuscript documents in possession of the society and the State archives. The quarterly publication of the Southern History Association, with headquarters at Washington, already stands in the front rank among its kind. The General Assembly of Alabama has recently provided for the appointment of a history commission, to act in conjunction with the State Historical Society in the systematic collating, preservation, and ultimate publication of all that relates to the antiquities of the State. In Texas, the State University, at Austin, which has recently come into possession of that immense

collection of invaluable manuscript material, formerly known under the title of the "Archives of Bexar," has issued an appeal for assistance toward making its contents available by translation and publication. In Colorado the State Federation of Women's Clubs has taken up the subject of the preservation of the remarkable cliff ruins in the southwestern portion of the State, and is actively pressing for State or Federal legislation in the matter. The Arizona Antiquarian Association is doing similar work within its own territory.

While the work goes steadily onward, one by one the workers drop out of the ranks, and within a year science has been called to mourn the loss of Brinton, Coves, Dawson, Ernst, Hoffman, and Valentini.

Smithsonian Institution, National Museum, and Bureau of American Ethnology, Washington.—The past year has been one of unprecedented advance in all branches of the government establishment. Under the energetic administration of Professor W. H. Holmes the entire department of anthropology—by far the largest and most important of the National Museum—is being overhauled and systematized, new halls and galleries have been thrown open to the public, and a number of important collections have been added by purchase or field exploration. Under the present arrangement the archæologic material is displayed in the Smithsonian building proper under the supervision of Dr. Thomas Wilson, curator of prehistoric archæology, while all other ethnologic material, including collections made by the field collaborators of the Bureau of American Ethnology, is housed in the National Museum, under direct charge of Dr. O. T. Mason, curator of ethnology.

In archæology a valuable acquisition has been made in the Steiner collection of objects from the great Etowah mound and from ancient village and quarry sites in Columbia County, Ga. The noted Guesde collection of stone implements from the island of Guadeloupe has also been acquired and constitutes a wealth of material for the study of the art and custom of the ancient Carib tribes. An interesting and valuable series of ancient Peruvian skulls, showing prehistoric trephining, collected by the late Dr. M. A. Mufiz, has also been secured. These skulls have been described by Professor W. J. McGee in the sixteenth annual report of the Bureau of American Ethnology. Through the courtesy of G. W. Brackenridge, Professor Holmes was enabled to visit the ancient obsidian quarries in the vicinity of the City of Mexico, and obtained valuable material illustrative of this class of Aztec manufacture.

On an expedition into Mexico, extending as far south as Oaxaca, Dr. Walter Hough, assistant curator of ethnology, in company with Dr. J. N. Rose, made a fine collection of plants illustrative of Mexican ethno-botany.

A valuable old collection of more than one thousand pieces, obtained from the northern plains tribes by Mr. Emile Granier, has been acquired by purchase, and a splendid series of nearly five hundred baskets from the Pomo and other tribes of northern California, collected originally by Dr. W. J. Hudson, of Ukiah, was secured by Professors Holmes and McGee as one result of a former Californian expedition. This collection is of special importance for its beauty of workmanship and the wealth of symbolic decoration. From Cuba and Puerto Rico a number of Spanish war relics and implements belonging to the daily life of the people was obtained by Mr. Paul Beckwith; Dr. W. H. Dall, of the recent Harriman Alaskan expedition, brought back some Tlinkit material; and from South America has been obtained through Professor J. B. Hatcher a large collection of ethnologic material of the Tehuelche and Yahgan tribes of central and southern Patagonia. A fine Tarumari mummy, taken from a burial cave in the Sierra Madre, of Mexico, by Mr. James Mooney, has been placed on exhibition in the Pueblo Gallery, and valuable additions have also been made to the Colonial and Revolutionary department.

Among the extra-American additions must be noted a small collection from Luzon, by Dr. G. F. Becker, including among other things two Negrito skeletons, and a fine series from the tribes of the upper Congo region, Central Africa, secured by the Rev. S. P. Verner.

Monographs on the various collections, written by Smithsonian experts or collaborators, are published in the annual reports and occasional bulletins of the Smithsonian Institution and National Museum, all the illustrations for these papers being prepared from photos made in the photographic department of the museum in charge of Mr. T. W. Smilie. Through the assistance of the International Bureau of Exchanges these publications are distributed without cost to educational establishments and students in every part of the civilized world. The most recent monograph publication is a memorial upon Indian pipes, by Mr. J. D. McGuire, a Smithsonian collaborator, based upon a study of museum material.

The field explorations of the Bureau of American Ethnology during the past year have been carried on from Nova Scotia to Arizona, the scientific results being embodied in the papers of the annual reports of the bureau, while the tangible col-

lections, as already noted, are deposited in the anthropologic department of the National Museum. Dr. J. W. Fewkes continued his observation of Hopi ceremonies and exploration of ancient Pueblo sites in northern Arizona, and was still in the field at the close of the year. Professor J. B. Hatcher, a special agent of the bureau, whose valuable collections from Patagonia have been mentioned, also continued operations in the same field. During the summer season the director, Major J. W. Powell, accompanied by Mr. F. H. Cushing, made exploration of the mounds and shell-heaps along the coast of Maine, unearthing many relics of antiquity, not the least interesting of which was a portion of a suit of armor found in one of the graves. Dr. A. S. Gatschet made further linguistic and ethnologic researches among the Micmacs and cognate tribes of northern Maine, New Brunswick, and Nova Scotia; Mr. J. N. B. Hewitt made further extended studies of the Iroquois tribes both in New York and in Ontario; and Mr. F. W. Hodge, in company with Mr. G. P. Winship, for the American Museum of Natural History, and Dr. Elliott Coues, made a flying trip to the Rio Grande Pueblos, securing valuable ethnologic material and a fine series of several hundred photographs illustrating Pueblo life. During the summer season Dr. A. E. Jenks, as collaborator of the bureau, made extended investigation of the wild-rice industry among the Winnebagoes, Menominees, and Ojibways of the upper lake region. Toward the close of the year Mr. James Mooney, in prosecution of his study of the South Atlantic tribes, made an exploration of tide-water Virginia and Carolina, resulting in the discovery of five still existing tribal bands in Virginia, besides others in North and South Carolina. He also made some study of manuscript documents in possession of the Georgia Historical Society at Savannah. The photographic collection of the bureau has recently been enriched by the transfer from the Bureau of American Republics of a splendid series of photographs illustrating race types, scenes, and customs in Mexico, Central America, and South America.

The Peabody Museum.—Late in November the Peabody Museum of American Archaeology and Ethnology, in Cambridge, Mass., sent out an expedition to Honduras in charge of Mr. G. B. Gordon. Among the more important additions to the museum made during the year are a series of casts from Yucatan and Central America, with photographs by Maler of ancient sculptures of Guatemala; a collection of ancient remains of the Massachusetts tribes; the valuable Kimball ethnologic collection, formerly exhibited in the Boston Museum Theatre; a fine Samoan collection, including an outfit for preparing tapa cloth; a Malay collection from Singapore, made over fifty years ago; and a fine series of Indian and Polynesian pictures, including a number of copies of paintings in oil.

Considerable additions were made to the library, among them being fac-simile reproductions of the codices Telleriano-Remensis and Messicano di Bologna. Miss Alice C. Fletcher has continued her studies of Omaha and Pawnee rituals, and Mrs. Zelia Nuttall will soon publish, as No. 7 of the Museum Papers, a memoir entitled *The Keypnote of Ancient American Civilizations*, embodying the results of several years of research.

The American Museum.—During the year just ended the American Museum of Natural History, in New York City, has well maintained its position in the front rank of museum establishments for the extent, value, and systematic arrangement of its collections and the enthusiastic industry of its collaborators.

The recent work of the Jesup North Pacific expedition, organized some years since for investigation on both sides of the North Pacific, has been particularly notable and fruitful of results. In the Puget Sound region, Vancouver Island, and British Columbia, Dr. Harlan I. Smith, for this expedition, made important explorations of shell-heaps, cairns, and other sepulchral remains, together with anthropometric investigations, with a view to the determination of possible routes and limits of Asiatic influence from the coast into the interior. James Teit and George Hunt, the former already well known from his previous work, continued researches in British Columbia. On the Asiatic side Dr. Berthold Laufer, who left New York in May, 1898, under the auspices of the same expedition, continued his investigations in the Amur region and on the island of Saghalin, securing important collections and much valuable ethnologic and linguistic material from the Aino, Gilyak, and some other tribes of that almost unknown region. His anthropometric efforts were somewhat hampered by the superstitious fears of the natives. Contrary to popular impression, he finds the Aino not excessively hairy and does not think the type homogeneous. The Jesup collections in the museum are separately displayed in the "Northwest Coast Hall," now open. One brochure, upon the archaeology of Lytton, British Columbia, by Dr. Harlan I. Smith, has appeared during the year as the most recent publication of the results of the expedition, and other memoirs upon the ethnology and archaeology of the same general region are promised in the near future. The field work will also be continued under competent direction both along the northwest coast and in Siberia.

Another recent acquisition is an invaluable collection by Captain George Comer from a primitive tribe of Eskimo on Southampton Island, in Hudson Bay, living entirely cut off from communication with their own stock upon the mainland, and never before visited by white explorers. Owing to their complete isolation and the lack of ordinary working material, their home life and arts are particularly interesting subjects of study.

Within the United States archæological work has been carried on by Saville and Harrington along the Mohawk and lower Hudson Rivers and Long Island Sound. The Hyde expedition prosecuted excavations at the Pueblo Bonito ruins in Colaco Cañon, northwestern New Mexico, under Pepper, Hrdlicka, and Dodge, Professor Putnam making a short visit to the same locality, and the work will be continued during the ensuing year. Mr. George Parker Winship, accompanying an expedition sent out by the Bureau of American Ethnology, made valuable pottery collections among the Pueblos. Mr. R. B. Dixon made extended ethnologic investigations in California, under the auspices of the Huntington fund, which will be continued during 1900. These collections, with others, are now displayed in the General Ethnologic Hall, just opened.

The valuable collections from Mexico and Central America, the fruit of years of excellent field work, backed by generous patrons, is now displayed in the Mexican Hall, formally opened in December. Regarding this immense repository of originals, casts, and manuscript fac-similes illustrative of the extinct Maya and Aztec culture, it is only possible here to endorse the testimony of an expert witness that it is "the most important collection in existence for the study of the ancient civilization of Mexico and Central America." A bulletin embodying some of the results of the most recent Mexican explorations is expected shortly.

In South America, Bandelier continues his explorations, begun some years ago, among the Aymará ruins of the Titicaca region, and the tangible results are now installed in the Peruvian Gallery.

The usual free lecture course by museum specialists has been kept up through the winter season. Important additions have been made to the museum building, which is planned upon a scale that, when completed, will make the finest in America.

University of Pennsylvania, Philadelphia.—The event of the year in the record of this institution was the opening of the new museum. Under the efficient supervision of Professor Stewart Culin, curator of general ethnology, there have been placed on exhibition the Frishmuth collection of musical instruments, a recent gift comprising more than one thousand specimens; the Drexel fan collection, another late acquisition; several collections from Borneo, and the Williams collection from Morocco. A part of the Asiatic material has also been installed, but several important series, with a great wealth of general ethnologic material, are still awaiting room space. Other recent acquisitions, in addition to those already named, are the Sommerville East Indian collection; the Spanish-Filipino arms collection obtained in Spain by the curator in 1892-93; valuable faience presented by Mrs. William Pepper; the McIlhenny collections from Point Barrow graves, and the Dickeson mound collection. Space has been assigned in the basement to a collection relating especially to local history.

There have also been arranged in the new building selections from the Hearst collections from the southwestern cliff ruins; the Uhle collections from the ruins of Pachacamac, Peru, obtained through the liberality of the late Dr. William Pepper; the Cramp collection of Central American pottery; the Lumholtz collection from Chihuahua, and a valuable loan collection of jade and other stone objects from Costa Rica, together with the Loubat Aztec fac-similes and synoptical groups illustrating primitive developments. The recently established lectureship of American Archæology, under Professor Culin, will render these collections of constantly increasing value.

In the Egyptian section, in charge of Mrs. Cornelius Stevenson, valuable collections, of unquestionable authenticity and approximately certain date, have been added, which illustrate the development of civilization in the Nile valley from the earliest period up to Græco-Roman times. Particularly noteworthy is the Egyptian Pantheon exhibit. Of kindred interest is the Mediterranean collection, made possible by the generosity of Mrs. Phœbe Hearst and the Hon. John Wanamaker, embracing objects from Cyprus, Greece, Southern Italy, and the Etruscan tombs, some of the latter dating back nearly three thousand years.

The priceless collections in the Babylonian and General Semitic Section, under the curatorship of Dr. H. V. Hilprecht, are chiefly the results of the excavations so long conducted at Nippur under the auspices of the Babylonian Exploration Fund, and includes objects covering a period of six thousand years, reaching backward almost to the very dawn of civilization.

Two museum bulletins have been published during the year. Important additions have been made to the library, and the university has maintained a course of

lectures on archaeology and paleontology, including free lectures in outside cities by university specialists.

Ohio State Archaeological and Historical Society, Columbus.—This society is doing splendid work for the preservation and scientific exploration of the antiquities of the State, some of which are well known as the most remarkable east of the Mississippi. The great earthworks at Fort Ancient have been placed by the State Legislature in the care of the society, which is now making the place conveniently accessible to students. The Serpent Mound Park has also been turned over to the society by the trustees of the Peabody Museum. The prehistoric remains at Newark are already under State care. During the past year the society has carried on explorations at the ancient "Baum village site" on Paint Creek, the results of all field work being published in its quarterly journal, while the curator, Professor W. C. Mills, conducts a course of class lectures on anthropology at the State University.

Field Columbian Museum, Chicago.—This rapidly growing institution is closely affiliated with the University of Chicago, which conducts a course in anthropology, and co-operates with it in all work in that direction. During the past year important accessions have been made through the efforts of Dr. George A. Dorsey, curator of the department of anthropology, who made three collections in the field, one among the Pomos of Northern California, another with the Salish tribes of Washington, and a third, jointly with Rev. H. R. Voth, at Oraibi Pueblo, Arizona. Other collections made by Mr. Dorsey include archæologic material from Union County, Ill., and from the Peoria reservation in Indian Territory. In line with this is a recent acquisition of flint implements from Illinois, and a prehistoric series from Ohio. A fine archæologic collection from Pasadena, Cal., was presented by Mr. H. N. Rust, and the department of Mexican archæology was greatly enriched by donations from Mr. E. E. Ayer and Mr. M. A. Ryerson. The former also donated a series of Mexican baskets and pottery, and a number of baskets from the Pomo tribes, while Mr. W. D. Gates donated ancient pottery from southern Alabama. Large accessions were made from the plains tribes—the Cheyennes, Arapahoes, Comanches, and Sioux—and several life-size groups were added to the Eskimo department.

Most important work was done in the Hopi department, based chiefly upon collections obtained at Oraibi Pueblo by Rev. H. R. Voth, and presented to the museum by Mr. Stanley McCormick. The material includes a splendid series of masks, figurines, dance-staffs, ceremonial paraphernalia, pottery, and household equipments, classified and labelled according to a very exact system by Mr. Voth, who has also supervised the preparation of several life groups illustrating Hopi custom and ceremonial, together with a number of altars and sand mosaics, which were explained in a lecture delivered by him in connection with the museum lecture course. Additional material was obtained by Mr. Voth on a recent trip.

The Italian collection has been largely increased by purchase through Mr. E. E. Ayer of antiques in stone, gold, and pottery, with a number of mural decorations from the villa of Hadrian. Important additions also have been made, through the same channel, to the Egyptian collection, including a number of mortuary tablets, the labels for which have been prepared by Dr. Breasted, professor of Egyptology at the University of Chicago. A fine collection of bronzes has been procured from Benin, West Africa; and from Brandon, England, has been obtained an interesting series illustrating the manufacture of gun-flints. The valuable Umlauf collection of jade objects from Korea was presented by Mr. H. N. Higinbotham. A unique specimen of Korean art, the gift of Mr. James Horton, is a bed embroidered by the ladies of the Korean court, and by them presented to Miss Horton.

The Davenport Academy of Natural Sciences, which already possesses one of the most valuable prehistoric collections in the West, has but little new to report for the past year, but the purchase of an additional building site promises to afford enlarged facilities in the near future.

The Colorado State Historical and Natural Society, with headquarters in Denver, under the curatorship of Professor William C. Ferril, now occupies with its museum and library twelve rooms in the Capitol building, three of which are devoted to the invaluable Wetherell and Willmarth collections from the Mancos ruins, constituting the largest exhibit of prehistoric Colorado ethnology in the world. During the past year this department was visited by more than 60,000 people. The society being entirely a State institution, its collections are strictly limited to the things of Colorado. A special educational feature is a series of lectures upon Colorado subjects, given in the museum rooms to the teachers and pupils of the city schools by the curator, and illustrated from the collections. Some years ago the society began an effort looking to the conservation of the remarkable cliff ruins of the State, through proper legislation. In consequence of this impulse, the State Legislature has twice memorialized Congress to reserve the Mancos region as a national park, and the

matter has recently been taken up with fair prospects of success by the State Federation of Women's Clubs, through a committee of which Mrs. Gilbert McClurg is chairman. Important explorations have lately been made in the same region by Captain Cecil A. Deane, who reports the discovery of an extensive area literally covered with the remains of stone houses.

The Arizona Antiquarian Association, organized in 1895, has been incorporated during the last year, with headquarters at Tempe, with Dr. J. Miller as president, and Dr. James McNaughton as secretary. Its objects are to collect materials for a museum of prehistoric antiquities, to make study of the ancient monuments, and to protect and preserve them from vandalism. About 3000 museum specimens have already been secured, and good work has been done toward protecting some of the most noted ancient remains. Members are also making valuable studies of the general ethnology of the existing tribes of the Territory, with a view to ultimate publication of the results.

The Golden Gate Park Museum, San Francisco, with Professor C. P. Wilcomb as curator, has received a number of accessions during the year, the whole number of specimens of all kinds now in the museum, including loan collections, being about 50,000. A valuable feature is a complete series of fine oil paintings of the old missions, painted by H. C. Ford, the artist, before any of them had been much injured by decay. Owing to the limited funds, few large purchases or field explorations can as yet be undertaken, but the energetic curator has himself made several extended visits among the northern tribes of the State, securing valuable ethnologic material of a kind that is rapidly disappearing. The interior arrangement and classification system of the museum has been much improved, and the establishment is now on a better working basis than ever before.

Ontario Archaeological Museum, Toronto.—This institution, under the efficient curatorship of Professor David Boyle, is doing excellent work in its own field. Among the operations of the past year are a series of explorations by the curator of mounds upon Pelee Island, in Lake Erie; by Mr. G. E. Laidlaw, of ancient village sites in Victoria County; by Mr. W. J. Wirttemberg, in the old Attiwandaron country of Oxford County, and by Mr. A. F. Munter, in the old Huron country. In regular ethnology considerable attention has been given by Mr. A. F. Cringan to the collecting of songs and music of the pagan Iroquois of the Tuscarora reservation. These songs, with much other ethnologic and linguistic material, will be embodied in the annual report of the curator. The museum now counts 2300 specimens, of which more than 2000 have been added during the year, among them being a number of valuable Aztec relics, the gift of Mrs. W. Stuart. It is visited annually by many thousands of persons, and there is abundant evidence that popular interest in the subject is in a healthy condition.

Latin-America.—The several museums and kindred institutions in Mexico, Central America, and South America seem to be nearly at a standstill so far as anthropologic work is concerned. No field exploration is reported, and the chief ethnologic result for the year appears to be the publication by the *Museo Nacional de Mexico* of some manuscripts relating to the Indians, written about the middle of the seventeenth century. Dr. Nicolas Leon, the well-known ethnologic student of the City of Mexico, is also at work upon a study of the Tarasco Indians, which may in time be published under government auspices. The recent death of Dr. Ernst, for a long time the director of the *Museo Nacional* of Caracas, Venezuela, is a severe loss to science in South America.

ANTIGUA, an island of the West Indies, constituting with its dependencies, Barbuda and Redonda, a presidency of the British colony of the Leeward Islands (*q. v.*). The area of Antigua is 108 square miles and of the dependencies 62 square miles; the population of the three is about 37,000. The crown colony system of government was instituted in March, 1898. The capital, St. John, with a population of nearly 10,000, is also the seat of government for the Leeward Islands colony. The chief product is sugar, the export in 1897 amounting to £101,106, but other exports are pineapples, molasses, rum, tamarinds, and arrowroot. The following statistics are for 1898: imports, £43,829; exports, £79,178; revenue, £39,663; expenditures, £55,586; public debt, £137,474. The aggregate entrances and clearances in foreign shipping in 1897 amounted to 445,948 tons.

ANTI-IMPERIALIST LEAGUE, NEW ENGLAND, was organized in Boston, November 19, 1898, and in 1899 had a membership of 50,000. It is estimated that since its organization about a hundred Anti-Imperialistic societies have been formed in the United States, notably in New York, Philadelphia, Chicago, Springfield, Cincinnati, Washington, D. C., Los Angeles, Portland (Oregon), and Minneapolis. The aim of the society is to oppose the jurisdiction of the United States over the Philippines. President, George S. Boutwell; secretary, Erving Winslow, 44 Kilby Street, Boston, Mass.

ANTIMONY. The American ore mined in 1898 amounted to 697 short tons, and was about 20 per cent. of the total quantity smelted in this country, as the foreign countries are still our important source of supply. The increased demand for antimony was due to the greater use of copper, zinc, and lead, with which it is mixed to form alloys. The development of the antimony industry in this country has been remarkable, and the production of metal in the United States has increased from \$12,000 between 1880 and 1886 up to \$184,050 produced in the year 1898 alone.

ANTISEPTIOS. See ASTEROL.

ANTITOXIN. See DIPHTHERIA; SERUM THERAPY.

ANTIVACCINATIONISTS. See SMALLPOX.

ANTIVENENE. See SERUM THERAPY.

APPALACHIAN MOUNTAIN CLUB, organized in 1876 to preserve the beauty and attractiveness of mountain resorts, and to collect scientific data concerning the mountains of New England and adjacent States. In 1899 there were 1165 members. It publishes *Appalachia*. President, Albion A. Perry; corresponding secretary, John Ritchie, Jr., Box 2795, Boston Mass.

APPLETON, WILLIAM HENRY, senior member of the publishing house of D. Appleton and Co., New York, born 1814, died October 19, 1899, was the last of the men who had built up the older houses which made New York a publishing centre. The part which he took in developing the business founded by his father, Daniel Appleton, was a conspicuous one for over sixty years. He began in 1825 as a clerk in his father's bookstore, New York. Five years later he was sent to Europe, where he displayed his business sense by buying on his own responsibility one thousand copies of an expensive holiday edition of a work just issued by Longman. The books were quickly bought up by the trade in America, and the venture proved successful. On a subsequent business trip abroad, during the course of which the panic of 1837 came on, his judgment in carrying out his mission probably saved his father's firm from falling in the general ruin. In the following year, at the age of twenty-four, he was taken into partnership with his father, becoming the head of the firm in the latter's retirement. In this capacity he was active in pushing the publication of the new *American Cyclopadia*, edited by Charles A. Dana and George Ripley, and introducing the works of Darwin, Huxley, Tyndall, and Spencer to the American public. From this class of publications the *Popular Science Monthly* naturally developed. Mr. Appleton also brought out Webster's Spelling Book, whose circulation was in the millions. Other of his enterprises were Benton's *Thirty Years in Congress*, Disraeli's *Lothair*, *Picturesque America*, McMaster's *History of the People of the United States*, and the *Annual Cyclopadia*, founded in 1861. He retired from active work several years ago. Mr. Appleton was prominent in the struggle for an international copyright. He was a trustee and director of various important business and charitable institutions and a prominent clubman.

ARABIA, a large peninsula in southwestern Asia, lying to the east of the Red Sea. Its estimated area is 1,230,000 square miles, though some accounts give it at 1,000,000 square miles, and the estimates of population range from 4,000,000 to 12,000,000, the lower estimates being the most recent. It comprises the two Turkish provinces of Hedjaz and Yemen and a tract which is under British influence. The latter includes the state of Oman in the southeastern part of the peninsula and extending along the coast for nearly 1000 miles. There have been friendly relations between the Sultan of Oman and the government of India for many years, and a British consul or political agent resides at Muscat. On the western coast also there is the British dependency of Aden (*q. v.*), which is subject to the Bombay government. Central Arabia is independent, being occupied by Arab tribes, which acknowledge no single ruler. Turkish rule does not penetrate much beyond the strip of land along the coast of the Red Sea and the Persian Gulf. In the two Turkish provinces of Hedjaz and Yemen the population is estimated at 1,050,000, and the combined area is 173,700 square miles. An Arab insurrection was reported in Yemen in 1898, and it continued during part of the succeeding year. Its origin was attributed partly to race hatred and partly to the taxes imposed by the Turks upon pilgrims to Mecca. It started in the district of Assir, it is said, under the leadership of Ben Hamid. The Turks defeated the rebels toward the end of November, 1898, at Shenel, inflicting a loss, estimated at 4000, and losing about one-half that number themselves in killed and wounded. Another engagement took place in December, 1898, between Hodeida and Sana. In April, 1899, it was reported that the insurgents had gained advantages over the Turkish forces, and later, in the middle of May, that the Turkish commander, Abdullah Pasha, had been obliged to retreat to Sana after suffering heavy losses. Some account of the international conflicts between France and England, arising out of the former power's

attempt to obtain a harbor in the dominion of the Sultan of Oman, north of Muscat, is given in the article on France (q. v.).

ARBITRATION, INTERNATIONAL. See HAGUE CONFERENCE.

ARBITRATION, LABOR. In several States of the United States the laws provide for boards of arbitration and conciliation in labor disputes. The decisions of these boards are not binding, but are meant to bring to light the facts concerning matters in dispute and to insure, by every possible means, the maintenance of industrial peace. The principle of compulsory arbitration, which would render the decision of the board legally binding, has not been generally approved, on account of the difficulty of making the laborer abide by the decision and the likelihood of discouraging the investment of capital in an industry that was conducted under this condition. A federal law of 1898 established a means of arbitration for labor disputes arising between common carriers engaged in interstate commerce and their employees. It provided for the reference of such disputes to the chairman of the Interstate Commerce Commission and the Commissioner of Labor, and if they were unable to secure a settlement, the dispute should be submitted to a board of three persons, one named by the employer, the other by the labor organization of the employees, and the third to be chosen by these two. The law also provided that the award should be final, unless set aside by the court for error. It is still too early to present the conclusions as to the workings of this law. In Great Britain the means for arbitration and conciliation were established by the act of August 7, 1896, which provides that boards constituted for the purpose of settling disputes may apply to the board of trade for registration. A board of trade may also create these boards of arbitration and conciliation whenever it seems necessary. When disputes arise the board of trade may inquire into the causes and circumstances of the differences, take steps for the settlement of the dispute by amicable means, appoint a person or persons to act as conciliator or conciliators, or appoint an arbitrator. Neither of the last steps can be taken, however, except upon the application of the parties to the dispute. The important points are that the law gives a certain official standing to voluntary boards of arbitration and conciliation and that it provides for the keeping of records, etc. Other laws contain provisions for the arbitration of disputes relating to matters with which the laws are concerned. In France there is a peculiar institution known as the councils of *prudhommes*. These are for the purpose of settling disputes between individuals, and not for the settlement of collective labor disputes or strikes. They are especial tribunals, made up of employers and workmen, to adjust by conciliation or, upon the failure of conciliation, to adjust by judicial means disputes between employers and workmen or between employers and superintendents. When their decisions involve more than a certain sum appeal may be made from them to the tribunals of commerce. They are established by the decree of the central government for particular localities and industries, and the members are chosen by the following classes of electors: employers twenty-five years of age and having certain qualifications in regard to trade experience, and resident in the district; superintendents, foremen, and workmen having similar qualifications. Membership is limited to electors thirty years of age and men who can read and write. There is the same number of members chosen in each case. The council elects its president and vice-president from among its own members, and if one of these officers represents the employers, the other must represent the employees. The term of service is six years, but members are eligible for re-election. Service is gratuitous, but the communes are empowered to pay a remuneration if they wish to do so. These councils consist of a general bureau and a special bureau, the former of two members, an employer and an employee; the latter of four members, of whom two are the president and the vice-president of the council. The special bureau has charge of minor disputes between employers and employees, and its object is to put an end to them by means of conciliation. Upon its failure to do so it turns them over to the general bureau. The functions of the councils are both judicial and administrative. Their jurisdiction is limited to the industries for which they have been established and to consideration of matters which have to do with the labor contracts or apprenticeship. The subjects which chiefly engage their attention are for the most part connected with wages, hours of labor, the maintaining of apprenticeship agreements and the penalties for defective work. Their judgments are final when the amount involved in the dispute does not exceed 200 francs (\$38.60). Disputes involving an amount in excess of that may be appealed to the tribunal of commerce. They have some criminal powers, since they may take cognizance of acts of workmen or employers which tend to cause disorder in the industries of which they have charge, but these powers are seldom exercised. The administrative functions of the councils consist in the keeping of records of the number of trades and of employees in establishments, of keeping the designs for work of which employers wish to retain the exclusive use, and of acting as an advisory body. As to collective disputes, the law of December 27, 1892,

provides for the means of settling such disputes. It was passed with a view to encouraging a recourse to arbitration. It sets forth certain methods by which employers and employees, acting either together or separately, may set in progress a movement for arbitration or conciliation. Either party to the dispute may address a declaration to the justice of the peace of the canton in which the dispute has arisen. This declaration gives the names and domiciles of the applicants, explains the matter in dispute, gives the names and domiciles of the persons to be notified of the proposal of conciliation or arbitration, and gives the names and domiciles of the delegates chosen by the applicants to represent them. The justice of the peace, who receives this declaration, must give notice of its receipt within twenty-four hours and deliver it to the other party or parties to the dispute or their representatives. If the latter agree to the proposal, the justice of the peace must invite the parties or their delegates to form a committee of conciliation, and if the agreement is rejected by this committee, it is set down in a report prepared by the justice of the peace and signed by the parties or their delegates. If no agreement is reached, the justice of the peace invites the parties to appoint an arbitrator or arbitrators. If a strike occurs without an attempt to set this machinery in motion, the justice of the peace must invite the employers and employees to make known to him within three days the nature of the dispute and their decision on the question of conciliation or arbitration. All the reports and decisions in these matters are kept at the office of the justice of the peace, who is required to send a copy free of charge to each of the parties and address a copy to the Minister of Commerce and Industry through the prefect. The request for conciliation and arbitration, the refusal or failure to respond on the part of the other party, the decision of the committee of conciliation or of the arbitrators, must be made public by each of the mayors of the communes over which the dispute extends, the justice having sent a record of these matters to them. The place of meeting for the conciliators or arbitrators is provided, heated, and lighted by the communes, and the expenses of the meetings are included in the obligatory expenditures of the communes. See LABOR.

ARBUTHNOT, General SIR CHARLES GEORGE, was born in 1824; died April 14, 1899. Having finished his studies at Rugby, he entered the royal artillery in 1843. He was a brigadier-general in the Afghan war of 1878-80; was commander-in-chief of the Bombay army in 1886 and of the Madras army from that year to 1891. In 1881 he was made a G. C. B.

ARCHÆOLOGICAL INSTITUTE OF AMERICA. The annual meeting of the council was held at Columbia University, New York, on May 13, 1899, the two preceding days being given to the annual meetings of the committees in charge of the schools at Athens and in Rome. The report of the president, Professor John Williams White, of Harvard University, shows that the council now numbers 39, while the life members were 123 and the annual members 728 at the time of the meeting, though this total of 851 has been considerably increased since last May. The plan of arranging lectures which could be delivered before the individual societies, which was begun as an experiment in 1897-98, has proved successful, and will doubtless be continued. In its early days the institute devoted considerable attention to investigations in American archæology, and now a standing committee of three has been appointed to consider how the institute may best encourage study in this subject. At present the funds are not sufficient to warrant any undertakings in this field.

The two schools which are affiliated with the institute, though not under its direct control, also report a year of prosperity. The school at Athens had fifteen students in attendance, of whom six had already spent at least one year in Greece, while all show a much higher standard of preparation than was found a few years ago. The great need of the school is a permanent endowment sufficient to provide the \$8000 which is needed annually for a proper conduct of the work. The school at Rome, after four years of trial, entered on a new stage of its history in October, 1899, when it opened with a permanent director and an annual professor from an American college. The first director, appointed for a term of five years, is Mr. Richard Norton, who has already served the school for two years as professor of archæology. This school also is making great efforts to secure a satisfactory endowment.

The twenty-first year of the institute was also marked by the first general meeting, which was held at New Haven, Conn., on December 27, 28, and 29, 1899. The meeting was so successful as to justify fully the plan of holding such a meeting for the reading of scientific papers annually. Over one hundred members registered their names, and the number of papers offered was fifty-six, though, owing to the lack of time, only thirty-nine were actually read. Professor Charles Eliot Norton, honorary president of the institute, delivered the president's address on *The Work of the American Institute of Archæology*. Special mention may also be made of the report by Professor Richardson on *The Excavations of the American School*

at Corinth, and the paper by Professor Sterrett, of Amherst College, on *Some Troglodyte Dwellings in Asia Minor*.

ARCHÆOLOGY. 1. *Babylonia*.—The preparations for exploration in the valley of the Euphrates, which were announced last year, have already commenced to bear fruit, although as the work has only begun the definite statements of results are not likely to be available for some years. Two sites have been the subject of special excavations on a large scale. The Babylonian Committee of the Department of Archæology and Palæontology of the University of Pennsylvania despatched Dr. J. H. Haynes to Nippur in August, 1898, but unavoidable delays prevented his arrival at his destination until February, 1899, when a work was at once begun, which is to be continued until May, 1900. The general supervision of the work is in the hands of Professor H. V. Hilprecht, with Dr. Haynes as field director, and Messrs. Fisher and Geere as architects. A preliminary report, presented by Mr. Talcott Williams at the general meeting of the Archæological Institute of America at New Haven in December, 1899, shows that at first the explorations were confined to the southwest part of the city, where a long wall was traced and other remains of buildings found by means of trenches, in some cases sixty feet deep. Nearly five thousand, whole or fragmentary, inscribed tablets were found and many small objects, such as bowls, mirrors, etc. Four hundred and thirty-one graves were opened, and as all the details were carefully noted, a valuable addition to our knowledge of Babylonian burial customs has been made. Owing to the intense heat the excavations in the summer were removed to the temple of Bel on the east bank of the canal. In the upper levels a few objects of the late Hebrew settlement were found (about 700 A.D.), but the important finds belong to the very early history of Babylonia, from Ur-Gur (about 2800 B.C.) back to Naram-Sin and Sargon I. (3800 B.C.), while there are inscribed vase fragments and crude bricks of earlier dates, one inscription belonging to a king who ruled about 4000 B.C. The fragmentary condition of the statues and stone vases, and the numerous remnants of the contents of the temple, confirm the theory, already advanced by Hilprecht, that the temple was sacked by the great Elamite invasion which spread over Mesopotamia and even to the Mediterranean, about 2200 B.C.

The other great undertaking is the campaign which the German Oriental Society has opened at the ruins of Babylon, where Dr. Koldewey and his assistants have attacked the mound El-Kasr, which contains the palace of Nebuchadnezzar. The preliminary report shows that a trench has been begun, which is to cut directly through the mound, and has already laid bare a part of the ancient walls, which seem to have deserved their reputation for thickness. The outer wall, which is built of bricks with the stamp of Nebuchadnezzar, is 7.25 metres thick, then comes a filling of sand and rubbish, and then the inner wall of 13.10 metres, making the total 41.85 metres. The latest reports indicate that the outer walls of the palace have been reached. The objects found seem to be merely fragments of decoration in glazed bricks with reliefs, similar to those found at Susa, and a number of short inscriptions. The association has decided to spend 100,000 marks a year for at least five years on the exploration of the great capital.

II. *Palæstine*.—The quarterly statements of the Palestine Exploration Fund during 1899 have brought information about important excavations at two points, conducted by Dr. F. J. Bliss and Mr. Macalister. At Tell Zakariya, a hill about three hundred and fifty feet high on the road from the plain to Hebron through the valley of Elah, a pre-Roman fortress was uncovered, occupying the southeastern corner of the plateau, with walls of rough stone about 4½ feet thick, and in some places preserved to the height of 20 feet. At the time it was built a considerable amount of débris from an earlier occupation had accumulated, and at a still later date six towers were added. It is suggested that the fort was built by Rehoboam. About half of the interior was excavated to the native rock, and the result showed that, while two main strata were distinguished, one resting on the rock, and containing pre-Jewish pottery, and the other mainly Jewish with a slight mixture of Roman near the surface, there were probably four distinct occupations of the site—that is, before the conquest of Joshua, at the time of the Jewish fortification, in later Jewish times, and for a short period under the Romans. The buildings and other remains found inside the fortress are said to have thrown much light on the daily life of the inhabitants. The place is of strategic importance and has been tentatively identified with Gath or Azekah, with perhaps a slight probability in favor of the latter.

Another possible site for Gath is Tell-es-Sâfi, where Dr. Bliss began work soon after the conclusion of the excavations at Tell Zakariya. This hill is to the west of the other, and stands at the entrance of the valley of Elah into the Philistine plain. In 1144 A.D. the crusaders built the castle of Blanche Garde on the southern end of the hill as a defence against Ascalon. Trial pits were sunk to determine the strata.

and then a section 80x90 feet was selected for complete excavation, of which about two-thirds has been cleared to the rock. The results show two pre-Jewish strata, one of which is older than that on Tell Zakariya, a Jewish stratum continuing into Greek times, and finally a deposit of the crusading occupation. As the city wall does not rest on the rock, it seems to have been built during the Jewish period. The digging brought to light part of a row of monoliths, and near by a quantity of bones of animals, while a series of chambers were grouped around. This suggests a sacred circle, around which a temple was built in the later pre-Jewish period. As yet nothing has been found to throw any light on the name of the ancient city on this hill, though Clermont-Ganneau has pointed out its occurrence on the mosaic map of Madeba under the name Saphitha.

III. *Egypt*.—That Egypt is still the field most actively cultivated by excavators appears from the list of sites in which permission to excavate was sought during the season of 1898-99. Twenty-two places or districts and eighteen excavators are named, not including the work carried on by the government. It is a cause of special gratification that no permits have been granted to dealers, and it is to be hoped that the day of unscientific digging for antiques has passed away, for almost every report of recent investigators bears testimony to the irreparable damage done to valuable sites by those whose only anxiety is to secure saleable curiosities. Of special interest also is the appearance of the Germans among the explorers, as their thoroughly organized work must add greatly to the scientific treatment of the remains of ancient Egypt. The importance attached to this new field is shown by the appointment of Dr. Borchardt as Egyptologist on the staff of the German consulate in Cairo to care for the interests of German archæologists and museums.

The Director of Antiquities, M. Loret, has uncovered in the necropolis at Sak-kâreh a number of mastabas belonging to the VIth dynasty and richly decorated with reliefs, and in the valley of the kings, near Thebes, he has found the tomb of Thothmes I., the smallest of the royal tombs, but of special interest as the first in this great burial-place of the XVIIIth, XIXth, and XXth dynasties. In the tomb of a fan-bearer, who, contrary to the usual custom, was allowed the favor of burial in the royal valley, was found a curious symbol of a future life. An image of Osiris had been drawn on a linen cloth, which had been stretched over a couch; on this figure earth had been laid and grain sown, which by its springing up gave a figure in living green of the dead Osiris. One of the government inspectors, M. Legrain, has been occupied in strengthening and repairing the temples at Karnak, as well as in excavating in that neighborhood. That these repairs were sadly needed is clear from the report that on October 9, 1899, eleven of the columns on the north side of the great hall fell, though fortunately without carrying away any of the parts already repaired.

Explorers of the Berlin Museum have found at Abusir one of the oldest temples in Egypt, dedicated to the sun-god by a king of the VIth dynasty, and elaborately decorated with reliefs, which have unfortunately been badly mutilated in later times. The same museum has recently obtained the loan of a large mass of papyri from the temple near Illahûn, which on examination proved to be a part of the temple records, throwing much light on its management and the details of religious services. Of special importance are two letters relating to the rising of Sirius, which show that the seventh year of Usertesen III. of the XIIth dynasty fell between 1876-73 B.C., and that the dynasty ruled from 1906-93 to 1783-80 B.C., nearly one hundred and fifty years later than the latest date hitherto assigned. The value of this discovery lies in the fact that this is the first clearly ascertained date during the period of the Middle Kingdom, although the New Kingdom has long been dated with some accuracy.

For the Egypt Exploration Fund Mr. Petrie has been exploring the edge of the desert from Denderah to Hû, with results of considerable importance for the pre-historic civilization, derived from the careful classification of objects from more than one thousand graves. A further series of graves from the VIth to the XVIIIth dynasty has thrown much light on the development of Egyptian pottery. For the Græco-Roman branch of this fund, Messrs. Grenfell and Hunt have been exploring various sites at the southwestern end of the lake called Birket-el Kurûn. While over one thousand papyri have been found, of which about three hundred are complete, no definite statement of the contents has yet appeared, and thus far the most important result of their work seems to be the settlement of the question as to Lake Moeris, which originally filled the Fayûm, was partially reduced by the dam of Amenemhat I., and under Ptolemy Philadelphus was forced back nearly to the limits of the present lake.

The second volume of the Oxyrynchus papyri has but little less interest than the first. In addition to a number of first-century documents and letters, similar in general character to those already published, there is a very long legal paper of the year 186 A.D., being the petition of a certain Dionysia against her father, who is

alleged to have cheated her out of some property and endeavored to take her from her husband. The document throws much light upon the property-rights of women in Egypt and the administration of the old law by the Roman magistrates; of special interest is the collection of precedents cited by Dionysia. Among the literary fragments are fifty-one lines from the end of a comedy of Menander, which give much information as to the probable structure of the play; a portion of a list of victors in the Olympian games, covering the years B.C. 480-468 and 456-448, and showing the winners in thirteen events for each year, whereby much light is thrown on the dates of some of the odes of Pindar and Bacchylides, and on the chronology of some artists of the fifth century; and an important, though fragmentary commentary on Iliad XXI., which seems to be the source of the valuable Geneva scholia to that book, though containing considerable new material, including several new quotations from classical Greek writers.

In this field two important works have recently appeared, Mr. Kenyon's *Palæography of Greek Papyri* is the first statement for the use of students of the indicia furnished by the various styles of writing as to the date and character of the documents, and of the changes in both literary and non-literary handwriting from the earliest Greek papyri down to the time when vellum superseded the earlier material. Professor Wilcken's *Griechische Ostraka* is a collection of the large number of documents of all sorts written on potsherds, a favorite material in some parts of Egypt where paper does not seem to have been plentiful. The introduction, however, goes far beyond the mere material collected, as it discusses the evidence on the economic and financial conditions prevailing under Greek and Roman rule.

IV. *Asia Minor*.—During the summer of 1898 Messrs. Anderson and Crowfoot, of the British school at Athens, made an important journey of exploration through western Galatia as far as the Halys, tracing the lines of the ancient roads, and collecting many unpublished inscriptions. They also studied about fifty ancient sites, many of which they were able to identify for the first time. A number of remains of primitive times were examined, but the question of the modifications in the civilization of the original inhabitants under the influence of the conquerors from Phrygia, Persia, and Gaul can only be settled by detailed study of the graves, though Mr. Anderson believes that the Gallic invaders were Hellenized in the cities and exerted no influence on the mass of the inhabitants in the country districts, as they were rather a small ruling class than an important element in the population. Another tour made by Messrs. Anderson and Munro through eastern Galatia and western Pontus is also said to have yielded important results, especially in the identification of sites and the fixing of stations along the Roman roads.

The work of the Berlin Museum at Priene has been brought to a close during the year. The last campaign led to the discovery on a terrace above the theatre of an important Christian church of the sixth century, a temple of Demeter and Kore, a Greek gymnasium, and other buildings. Though very successful in revealing a Hellenistic city, there is some regret that no traces were found of the old Ionic city, and it seems very likely that its site is still unknown. From Priene the excavators have turned their attention to the important site of Miletus, where the marshy nature of the soil has hitherto prevented satisfactory results. By means of deep trenches for drainage this obstacle has been largely removed, and though no detailed report has yet appeared, the discoveries thus far are said to promise well for the future. The importance of archæological work in the East has led to the assignment of Dr. Wiegand to a residence in Constantinople in order that there may be an expert available to care for the interests of the Berlin museums in Oriental discoveries.

At Ephesus the most important result of the Austrian campaign of 1898 (published in 1899) was the excavation of the theatre, including a Roman stage-building two stories high with a stage 2.70 metres high and 6 metres deep, with a richly decorated background, all apparently of the second century, while beneath were found the remains of the walls of the earlier Greek theatre. A large number of sculptures in relief and in the round, many interesting inscriptions, and two streets of great importance for the topography of the city have also been discovered.

V. *Greece*.—During the past year the Greek laws relating to antiquities have undergone considerable modification. According to the new law, all objects found are declared to belong to the state, which also has the right to dig experimentally on private property and remove articles discovered, if public interests seem to require it. No interference on the part of the proprietor is allowed, but there are provisions for compensation for damages or temporary use. If the results of an excavation are important, the state can take over the property. All discoveries must be at once reported to the authorities, and remains of buildings must not be touched for at least one month, within which time the state must decide as to the compensation. Heavy penalties are attached to violations of the law, and in particular to any private digging, which is absolutely prohibited. The law provides for the organization of a large staff of inspectors, and for their training. The museums,

which have always been free, are now to be so only on Sundays, though students will still be provided with free tickets. The provision that objects unsuitable for the Greek museums may be exported, will certainly prove advantageous, provided it is construed liberally, as it will remove the need of concealment by foreign museums of the exact source of their purchases. The establishment of the new régime in Crete has also brought with it a law regulating excavation on that island, which is now thought to contain the key to many of the puzzling problems relating to the prehistoric civilizations of the Ægean. In many respects the provisions seem similar to the new Greek law. Compensation is provided for the discoverer of movable antiquities, but they must be reported within five days. Excavation is declared the exclusive right of the government, which, however, may exercise it through scientific bodies of any nationality. It is to be regretted that all exportation is forbidden, though the authorized excavators retain for five years the right to sell casts and photographs of their discoveries.

The reports of the season of 1898-99, which have been published, as well as the current items about the work during the latter part of 1899, show that at present comparatively few great undertakings are going on in Greek lands, though the Greek Society and the foreign schools have by no means been idle. In general, however, the investigations have been at small sites, and have been directed rather to securing light on the very difficult questions concerning the so-called pre-Mycenæan and Mycenæan periods, and the origin and development of the earlier forms of Greek civilization and art, than to the exploration of great centres of classical life. Almost the only exception is the work of the American school at Corinth. The other classical sites at present under the spade are in Asia Minor.

The Greek Archæological Society has laid bare the land around the Olympeion at Athens, and thus left the temple and its columns on a sort of pedestal, but without discovering much of value. At Eleusis the report of earlier work shows that the town was important in prehistoric times, and the chief results have been yielded by the necropolis of this period. At Sunium the excavations have brought most unexpected information. The remains of the propylæa of the well-known temple were fully uncovered, and so was a long stoa extending around the north and west sides of the temple. Not far away a curious building 19 metres by 14 metres was discovered, which seems to have had columns on the south and east sides only, while the roof was supported by four interior columns. Most surprising, however, was the discovery in the temple of an inscription, which shows that this so-called temple of Athena was really the temple of Poseidon. Where the famous temple of Athena on this promontory is to be sought is still quite uncertain, though it is not impossible that it may be represented by the peculiar building just mentioned. At Thermon the excavations have shown that all the ground on which the ancient temple, now proved by an inscription to have been dedicated to Apollo, was built is formed from the ashes of a great altar. There have also been found more architectural members of painted clay, so that the conclusion seems warranted that in the seventh century B.C., at the time when Damareus of Corinth is said to have settled in Etruria, decorations similar to those found later on the Etruscan temples were already in use in Greece. On the islands of Siphnos and Syros, Chr. Tsountas has discovered cemeteries of the pre-Mycenæan age, showing a civilization similar to that on the island of Paros, but somewhat more advanced. Two citadels have also been excavated, the one on Syros apparently belonging to the latter part of the pre-Mycenæan period, while that on Siphnos was somewhat later, as the objects found were Mycenæan.

After six years of labor the French school has concluded its excavations at Delphi by uncovering a part of a gymnasium. No attempt has been made to excavate the lower town, as it is not believed the results would be sufficiently valuable. The work on Delos, too, seems to be temporarily suspended. This pause in the work of discovery is necessary, if the valuable results of past years are to be made accessible. A great mass of material from Delos is still unpublished, while of the countless inscriptions discovered at Delphi, only a small portion are available. Moreover, the school has a share in two important epigraphical undertakings proposed by the *Académie des Inscriptions et Belles-Lettres*. One is the preparation of a *Corpus Inscriptionum Græcarum Christianarum*, to include all Christian inscriptions even to the eighteenth century, with accurate fac-similes, and to be preceded by a smaller publication of all texts at present known. The other is the collection of all Greek inscriptions relating to Roman antiquities. The French have also given their attention to the study and careful reproduction of the Byzantine remains in the mediæval city of Mistra, on the slope of Mt. Taygetus to the west of Sparta.

The German institute has confined itself to smaller undertakings in Greece. Dr. Dörpfeld has continued his researches on the western slope of the Acropolis at Athens, but without reaching any satisfactory results. At Paros Dr. Rubensohn

has concluded his excavations by completely clearing the sanctuary of Asclepios, and then examining various points in the Acropolis and elsewhere. Two temples were discovered, as well as a necropolis of Hellenistic times, with sarcophagi and the usual ornaments, many of them of precious metals, while near the temples on the Acropolis a mass of pottery showed the presence of a prehistoric settlement. Dr. Hiller von Gärtringen has continued the excavations on the island of Thera, which he has conducted at his own expense since 1895. These explorations are uncovering not only many remains of the early "island civilization," but also a small city of the Hellenistic time with temples, theatre, agora, and stoa. Noteworthy also is the prompt appearance of a fully illustrated volume on Thera, describing in detail the geology, geography, botany, and history of the island, with a full account of the excavations down to 1898. The graves and their contents are to be treated in another volume.

The American school recommenced its difficult campaign at Corinth on March 27, 1899, and continued work until the end of May. The old temple was entirely uncovered and trenches were dug toward the south in the direction of the agora. Moreover, the fountain of Pirene, described in the last YEAR BOOK, was fully cleared and its identity fully established by the discovery of a Byzantine inscription which had once formed part of the façade and contained the word Pirene. The semi-circular apse found in 1898 in front of the fountain was supplemented by two others at either end, and in the court in front of the façade has been discovered the hypæthral fountain (*ὑπαῖθρος κρήνη*) of Pausanias, in a circular basin about twenty feet in diameter. Each of the apses contained three bases for statues, and the whole enclosure was lined with marble. The flight of marble steps near by, at the end of the road from Lechæum, was found to lead to the Propylæa, somewhat resembling a Roman triumphal arch, by which the agora, or market-place, was entered. The earlier trial trenches of 1896 now prove to have already determined the eastern and southern borders, and the settling of the rest of the plan is part of the work for 1900. Early in the season work was also begun upon some chambers in a huge block of native rock which had been left standing about 80 metres west of the temple when the material for that structure was quarried from the neighborhood. Its situation indicated that it was one of the monuments on the road to Sicyon, and the excavation proved that it must be the fountain Glauce, as there was disclosed a spring house with four chambers cut in the living rock, with a plain but effective façade of three pillars between two antæ. The water was brought from the direction of Acrocorinth by a conduit, whose exact course has not yet been discovered. Mr. Richardson suggests that the work may be probably attributed to Periander, who, like other Greek tyrants, gratified his subjects by providing a good supply of water. These excavations yielded the best sculpture yet discovered in two fine lions' heads, which had served as water-spouts. Several other pieces of sculpture and some Latin and Greek inscriptions, as well as many very early geometric vases, have been found, but the chief gain hitherto has been in fixing definitely the centre of Roman Corinth. Before the school began work not even the identity of the old temple was settled; now the temple has been shown to be Apollo's sanctuary, and besides the location is fixed of Pirene, the agora, Glauce, the theatre, and the baths of Eurycles. In spite of the important gains thus far, and the probability of still better results in the future, the work cannot be resumed unless funds are provided before spring, as all the available money has been expended. The difficulty and expense is great, as the remains lie very deep and the fertile soil is held by its owners at a high valuation.

The chief work of the British school has centred in the island of Melos for the last two years. The report for 1897-98, published in 1899, shows that careful excavations were made at Phylakopi, where four successive settlements were distinguished. Of the first the only traces are some very primitive potsherds. The second has left traces of house-walls, and remains showing that obsidian working was an important industry. The third period is marked by a much better city, with a strong wall and containing houses with finely decorated walls; of special interest is a vivid painting on stucco representing flying fish. The last period is contemporaneous with the Mycænæan civilization, and as at this time the use of obsidian decreased, the prosperity of the island seems to have suffered. Very little pottery of later date has been found. The last campaign (1898-99) has uncovered more dwellings of the last two periods, including a small but well-preserved Mycænæan Megaron, with an apparent separation of the men's and women's apartments. Though not of the historic interest of Mycænæ and Troy, the island is of scarcely less archæological importance, as it has yielded a very valuable and clearly marked succession of finds, illustrating the early civilization of the Ægean. A special publication is to be devoted to these excavations, which have been discontinued for the present, as it is believed more valuable results can be secured at Crete, where work is to be begun at Cnossus and elsewhere in 1900.

VI. *Italy*.—During 1899 the chief centre of archæological discovery was the Roman Forum, but the reports show that in spite of the extensive works carried on in the capital, the Italian government did not neglect the provinces, though in general the results do not appear to have been of great importance.

In Sicily, Signor Orsi has continued his studies among the remains of the early inhabitants of Syracuse. The Sicel settlements in this neighborhood were in touch with the Mycænæan civilization, but seem to have disappeared by 1000 B.C., probably driven away by the arrival of the Greeks, who must therefore have reached Sicily earlier than the date usually assigned. The same excavator has discovered the site of the Greek town of Helorus, a dependency of Syracuse, with the remains of a wall of the fifth century, and two groups of tombs, of which the later contains objects of the fourth and third centuries.

The eneolithic period, which has been recognized in northern Italy between the neolithic and bronze periods, has been shown to extend also to the Italian islands, and in Sicily the objects from this period show marked contrasts to the neolithic styles. In spite of this, however, there seems to be close connection with the continent, and both neolithic and eneolithic remains are probably to be assigned to an Iberian-Ligurian race, whose branches developed in slightly various ways. Even the *terra-mare*, supposed to belong especially in the valley of the Po, has been discovered near Taranto between a neolithic stratum resting on the bed-rock, and an upper layer containing local pottery with geometric decorations. Moreover, megalithic monuments, such as dolmans and menhirs, hitherto unknown in Italy, have now come to light near Terra d'Otranto.

The excavations in the necropolis of Este have yielded a series of graves extending from the later bronze age down to the coming of the Gauls. The tombs of Genoa have furnished the earliest examples of the introduction of cremation in place of the Ligurian custom of burial, while the presence of painted vases and bronzes resembling those of Bologna show the extent of the intercourse with the Greek colonies of southern Italy or Gaul. By degrees the story of the early inhabitants of Italy, their migrations and development in civilization, is becoming clearer, even though the discoveries that solve some problems usually open new questions to provoke further inquiries.

At Pompeii the excavations have been continued in that part of the city near the house of the Vettii, and many small objects have been found. Somewhat earlier a temple was discovered west of the Basilica, which was evidently in process of removal at the time of the eruption. A noteworthy addition to our knowledge of Pompeii is the work by Professor Mau, translated by Professor Kelsey, which at last provides English readers with a thoroughly accurate and modern discussion of the city and its remains by an acknowledged authority.

If the results in other parts of Italy have been such as to develop facts already known, in Rome the discoveries have been almost sensational, and have changed the work in the Forum from tentative exploration with about twenty men to a serious undertaking which already employs over one hundred. Near the close of 1898 the finding of the "black stone" was reported, and it was in this neighborhood, east of the Arch of Severus, that the most striking discovery was made. The black stone pavement, although it is certainly of very late date, has been regarded as too important to be removed, and so the work around it was somewhat delayed until a supporting framework was arranged, permitting excavation beneath. It was then found that some two metres below the *niger lapis* was a layer of yellow tufa, and on this a dark tufa base on which are two pedestals, whose shape suggests that they supported the two lions which an old legend mentions as guarding the tomb of Romulus. These bases were connected on the south by a step of tufa, and between them on the north, toward the Curia, was a smaller base. Slightly to the west of these bases and on the same level were a plinth on which stood a truncated cone, and near by the lower part of a quadrangular pyramid, one angle of which had been rudely bevelled. This monument is of special interest as containing by far the oldest inscription discovered in Rome, and probably the earliest specimen of the Latin language. It is written *boustrophedon*—that is, the lines run alternately from left to right and right to left. Owing to the breaking of the stone, only the beginnings and endings of the alternate lines are preserved. As it is altogether uncertain how much of the stone is missing—it may be that only about one-third is preserved—there seems very little hope of any satisfactory restoration or interpretation. Only a few words can be recognized, and all that seems even reasonably certain is that it has something to do with sacrifices. As to the question of date, opinion is somewhat widely divided. Some of the Italian scholars, who are anxious to find in the stone a proof of the veracity of early Roman legend, have endeavored to show that it is at least as early as the first half of the seventh century B.C. More conservative critics are disposed to place it at the very end of the sixth or early in the fifth century, but on palæographical grounds the evidence is really very uncertain. Among the

débris was found a fragment of a black-figured Greek vase of the last part of the seventh or early sixth century. It is said that the whole structure is evidently built on the Roman-Attic foot of 0.295 metres, and if this is true it is probably not much earlier than 450 B.C., but the inscription may well be older than the bases for the lions. However this may be, there can be no doubt that both cone and inscribed cippus were rudely broken, and that later, probably in connection with a raising of the level at that part of the Forum or Comitium, a solemn expiatory sacrifice took place; for above these stones was found a layer of dark earth containing fragments of tufa, charred bones of victims, hundreds of small vases, figures in bronze and bone, rings, pins, fragments of weapons, and a number of pieces of *as rude*, the earliest Roman money. The exact meaning of all these objects is still unsettled, for their relation to the topography of the republican Forum is far from clear. The problems, however, are by no means insoluble, and the news has recently arrived that all the difficulties caused by the presence of the modern street on the north side of the Forum have been removed, and that the place in front of the Church of San Adriano, known to occupy the site of the ancient Curia, or Senate-house, is to be thoroughly cleared. As the present pavement of the Comitium is now known to be late, it will, of course, be necessary to go beneath it.

Hitherto the private houses extending from the Church of San Adriano to that of San Lorenzo in Miranda (the temple of Antoninus and Faustina) have prevented the excavation of the site of the Basilica Æmilia. This obstacle has now been removed by the generosity of Mr. Lionel Phillips, a wealthy Englishman, who, having bought the land, has presented it to the government for excavation. The work was begun in the summer, but as yet very little of the architecture of the early building has been found, though a mass of walls belonging to the Middle Ages seems likely to throw light on the process of the destruction of the city. The marble steps of the Basilica have been uncovered, and also the foundations of a row of pillars. It is said that the length was about 60 metres, and the depth 20 metres. As the excavations are still far from completion, it is obvious that the plan of the building and of its later modifications cannot yet be prepared.

In other parts of the Forum the indefatigable Signor Boni has not been idle. The alley between the Regia and Atrium Vestæ has been cleared, and among other things a well has been discovered filled with a mass of pottery, chiefly broken, but showing a regular succession of deposits from the time of the early bucchero ware. Further excavations in the Atrium Vestæ have shown that about the fourth century A.D. the floors of the cells were raised, probably on account of dampness, and that the handsome marble mosaic floors are still preserved beneath these clumsy alterations. In one place the statue of a Vestal was found carefully buried, but without the head. The suggestion has been made that it belongs with a pedestal from which the name of the priestess had been erased.

The cofrse of the Sacred Way has also been followed, and it has been found that in earlier times it occupied a much lower level, and took a very different course toward the Arch of Titus from the Basilica of Constantine than is indicated by the present pavement. In other places, too, small discoveries are constantly made, and it seems certain that in a short time the picture of the Forum and its surroundings is to become much more definite, especially in the distinction between the buildings of different epochs.

VII. *France*, including *French Africa*.—For more than thirty years excavations have been continued at Bibracte, the town of the Hædui, and a recent report discusses the 1579 coins found there. Two-thirds are Gallic, representing over twenty tribes, but of special interest are four with the name of Orgetorix, and seven with that of Dumnorix, both well known from Cæsar.

In Tunis, Father Delattre has continued his work in the Punic cemetery of Carthage at Bordj-Djédid. The tombs are pits with grave chambers opening from them, usually containing several bodies. In the earlier graves skeletons are found, but later cremation was customary, and we find ash chests containing charred bones. Many small objects have been found, among them an ivory relief of a boar with an inscription in Etruscan. It is interesting to recall that in the fifth century the Etruscans and Carthaginians combined against the Greek colonies on Corsica. The temple of Demeter seems to have stood near this cemetery, and Father Delattre is inclined to connect the introduction of cremation with this worship, which was brought from Syracuse by Greek priests after 396 B.C. P. Gauckler has also excavated a Punic necropolis in this neighborhood where the objects in the graves seem to show a civilization strongly affected by the East and Egypt, and hence anterior to the Punic wars, when Greek and Latin influence prevails. He also discovered under a house of the time of Constantine a sanctuary of Jupiter Ammon. Four statues, three of good workmanship, were found hidden carefully, and the conclusion is drawn that on the final triumph of Christianity the images of the gods had been secreted.

In the other European countries archæological investigations are, of course, always in progress, but the past year has not been marked by any striking discoveries. In Germany and Austria the remains of the Roman occupation are being excavated and described, and in England not only at Silchester, but also at Caerwent, Roman towns are being systematically cleared. In Spain attention seems directed to the remains of pre-Roman civilization, and the work of classifying the early Spanish graves has been begun.

ARCHÆOLOGY (AMERICAN). While classical archæology derives a special and lively interest from the fact that it deals with vestiges of our own ancestry, the archæology of the new world acquires commensurate interest from the fact that it clears the way to understanding the earliest stages in the development of mankind; hence, the American researches greatly extend the vista opened by those studies of old world archæology which have been pursued so actively and successfully during past decades. Dealing as he does with the æsthetic and industrial types whence his own standards sprang, the archæologist of the old world finds it easy to interpret the artifacts of ancestral nations and tribes in terms of current manual and mental activities; he has but to turn backward the leaves of parental histories in order to trace the records of earlier generations left in their imperishable handiwork. The occidental investigator, on the other hand, finds his archæologic record to form an older book of a distinct series, inscribed in characters not to be interpreted from his personal or ancestral experience, but only to be read in terms of native mentality; so that his first duty is to acquaint himself with the methods and characteristics of the aboriginal handicraftsman. This distinction between the archæology of the old world and that of the Western Hemisphere is fundamental and far-reaching in its consequences; it defines the relations between the European and the American sciences, and it gives rise to the originality and independence of the American standards and methods of research in archæology.

Definitions.—Recent researches have tended to confirm the assignment of archæology to a secondary place among the sciences dealing with mankind and their less perishable products. Early in 1899 the Anthropological Society of Washington (the most active organization of its class in America) revised its organic law so as to represent fairly the various branches of anthropologic science; thereby it was organized into seven sections—namely, A, Somatology, or the science of the (human) body; B, Psychology, or the science of the mind; C, Æsthetology, or the science of arts; D, Technology, or the science of industries; E, Sociology, or the science of institutions; F, Philology, or the science of languages; G, Sophiology, or the science of philosophies. In this scheme material objects-matter in the form of artifacts pertain partly to æsthetology but for the most part to technology, while artifacts of prehistoric origin form the objects-matter of archæology. In connection with this classification, the same society favorably considered the proposal to introduce a new term for the designation of the American aborigines collectively—namely, *Amerind*; the term (which has already come into use among American anthropologists) being semi-arbitrary in construction, and chosen partly because of the facility with which it can be used in various forms—for example, *Amerindian*, *Amerindic*, *Amerindize*, etc. During the last decade, observations of aboriginal handicraft gradually led to the conclusion that decorative and other æsthetic devices originated in symbolism; and during the past year the parallel inference that primitive industrial devices are largely symbolic in origin has been formulated, and has found ready acceptance. The inference rests on the well-observed fact that the Amerinds are dominated by zootheistic (or animistic) motives, and habitually deify certain animals of their acquaintance, particularly the stronger and swifter and more cunning; and that they habitually seek to obtain and to infuse into their own personalities and appendages, by ceremonial and actual use of the animal organs, the strength and swiftness and cunning of the deified beasts. Thus, the teeth of the shark, the claws of the bear, the shells of certain mollusks, and the beaks of eagles are used as weapons; the incisors of the beaver are used as cutting tools, while tufts of feathers and fillets of deerskin are worn to promote swiftness, and fox-tails or coyote scalps to promote cunning; and even the most highly developed emblems and weapons, such as tomahawks and knives, commonly bear vestiges of this symbolic origin in special forms and markings. The recognition of the symbolic origin of industrial devices would seem to mark an epoch in archæology. The discovery tends to magnify the importance of the more perishable artifacts of tooth, shell, horn, bone, and wood, and correspondingly to minify the value of stone artifacts as a basis for the classification of primitive industries, despite their great abundance, due to their imperishable material. In accordance with the discovery, Cushing has proposed to designate the earliest stages of human culture as "prelithic;" so that the culture-stages, defined through researches among the American aborigines, become (1) Prelithic, or characterized by implements of organic material and symbolic design; (2) Protolithic, or characterized by designless or use-shaped

stone implements, and (3) Technolithic, or characterized by stone implements, wrought in accordance with preconceived design. This classification of stages in industrial development is strictly genetic; it can be applied chronologically only with considerable qualification, since the earlier devices persist largely in the higher stages, and also since the advancement attained by different contemporaneous tribes was widely diverse.

Instrumentalities.—The leading institution engaged in archæological researches in America during 1899 was the Smithsonian, through its branches, the Bureau of American Ethnology and the United States National Museum; the archæologic operations of the bureau were prosecuted specially in Arizona, California, Colorado, Maine, and New Mexico, while the museum made researches and collections in various parts of the United States, as well as in Mexico and several South American countries. Important researches and collections were made also by the American Museum of Natural History (New York), largely in connection with the Jesup North Pacific expeditions, but to some extent in several other districts. Particularly rich collections were installed in the new Museum of Archaeology and Paleontology of the University of Pennsylvania (Philadelphia), in which also important researches were conducted. Extensive operations were conducted in southwestern United States, Mexico, and Central America by the Peabody Museum of Archaeology and Ethnology (Harvard University, Cambridge); while the Field Columbian Museum (Chicago) contributed to knowledge through work in several districts of western United States. Noteworthy work was prosecuted also by Carnegie Museum (Pittsburg), Golden Gate Park Museum (San Francisco), the Ohio State Archæological and Historical Society (Columbus), the State Historical and Natural History Society of Colorado (Denver), the Arizona Antiquarian Association (Phoenix), the New York State Museum of Natural History (Albany), the Ontario Archæological Museum (Toronto), and several other working organizations. The results of the researches were brought out and co-ordinated in the Anthropological Section of the American Association for the Advancement of Science, the Anthropological Society of Washington, and the Anthropological Society of New York; the principal media for publishing being the *American Anthropologist* and the *Proceedings of the American Association for the Advancement of Science*.

Prelithic Artifacts.—One of the most noteworthy collections of American antiquities was that made in 1895 and 1896 by Frank Hamilton Cushing on the western coast of Florida; it was obtained chiefly from salt marshes and muck beds, in which easily perishable artifacts were preserved in remarkable perfection; and it is unprecedentedly rich in industrial and ceremonial devices of shell, tooth, horn, and wood, while many of the artifacts of wood and shell are beautifully carved and painted. During 1899 the extensive collection was overhauled, divided between the United States National Museum and Pennsylvania University, and subjected to a critical study. The results of the study (incorporated in the report of the secretary of the Smithsonian Institution for 1899) are indicated in a preceding paragraph. Concordant results have attended the final study of the collections among the Seri Indians by W J McGee. This interesting tribe has been found nearly destitute of knives and practically devoid of knife-sense, and the comparison of their meagre artifacts with the more abundant implements and ceremonial objects of the Florida muck beds indicates a close correspondence in culture, although the Seri tribe, whose habitat abounds in wave-worn pebbles, exhibit definite entrance into the stage of protolithic art.

Protolithic Artifacts.—Early in 1899 certain collections made in California by W. H. Holmes were installed and subjected to study in the United States National Museum, and many of the stone artifacts were found to represent the initial stage in the development of stone-working. Several of the California tribes may be classed as acorn people, since acorns form their principal source of food, and since their characteristic industries are conditioned by these food supplies. Some of the processes and implements vary from tribe to tribe—for example, in some places the acorns are cracked in the teeth, in others they are cracked with spheroidal stones, and in still other places elongated, pestle-like stones are employed; while other devices, such as those used in grinding the acorn meats, are much alike from tribe to tribe, though in each tribe there may be a diversity, growing out of the age of the apparatus or the degree of its development by use. Thus, the nether millstone is, in the early stages of use, a flat or slightly concave slab, which after more extended use becomes a deeply concave metate, still later a shallow mortar, and at length a deep mortar, which may eventually be worn through; while the grinding-stone concordantly changes from a simple cobblestone to a mano or muller, and finally to a pestle, at first thick and rude, but afterward slender and shapely. Not infrequently the genesis of an individual mill corresponds with the rise and passing of a family; the young woman may begin life with a flat-sided boulder and a few river-worn cobbles as a mill, which is then used as a metate;

gradually the mill develops into a mortar, with a well-rounded and polished pestle, shaped chiefly by wear (perhaps supplemented by slight dressing), on which she grinds vigorously in her old age for the support of her daughters and their husbands and the growing grandchildren; and on her death apparently the pestle is broken and the bottom knocked out of the mortar. Neglecting the final act, the individual growth of the primitive mill well epitomizes the phylogeny of its species, and demonstrates that in general the mortar must be regarded as the differentiated and eventually degraded offspring of a metate-like prototype, whence sprang also the metate along one line and the quirn and its derivatives along another. It is especially significant that the users of these mills take little note of the progressive change in their apparatus with continued use, and regard the pieces as natural objects rather than artificial objects—indeed, the most finely formed pestles are habitually called, and actually considered to be, river pebbles or cobbles. These observations on the living California Indians explain the moderately abundant prehistoric artifacts in the same region, of which considerable collections have been made; at the same time they aid in interpreting collections of prehistoric artifacts from other districts.

Technolith Artifacts.—The customary attention has been given to flaked and sculptured stone artifacts by numerous investigators and collectors. The most extensive studies were those of W. H. Holmes, in connection with the remarkable obsidian mines in the state of Hidalgo, Mexico. Of the many sources of obsidian (or volcanic glass) for the manufacture of implements and ornaments by the prehistoric Mexicans, this was probably the most important. The Amerinds first encountered by Cortez in Mexico employed numbers of obsidian knives, the larger number being mere flakes, yet so large, symmetric, and keen-edged that they were used for hair-cutting and shaving, as well as for incising flesh for all purposes, including surgery and human sacrifice; and exploration of the site throws full light on the processes of quarrying and manufacturing this aboriginal cutlery. The mines or quarries cover at least a square mile of a mountain ridge, which is still pitted with shafts ten to thirty feet deep, connecting with horizontal drifts, made in search of homogeneous masses or nodules; and almost the entire surface is sheeted with flakage, often several feet deep. Examination of this wastage in the light of known processes shows that the local labor consisted mainly in working out homogeneous masses and shaping these into the form of thick cylinders, usually four to six inches in length; and the observations on the ground and in other districts indicate that these cylinders were articles of extensive commerce, and were among the most highly prized possessions of tribesmen and families, the blades being obtained by skilful flaking from the cylinders, which were eventually reduced to the well-known "cores," not by the quarrymen, but by the makers of the knives as they were needed from time to time. Incomplete and defective cylinders were found by thousands, mingled with the other wastage; and numerous examples were found also of the stone hammers and picks used in the excavation and in roughing out the cylinders. The extent of the workings indicates that the Hidalgo quarries must have been operated for many centuries. Another noteworthy investigation of the year was that of an ancient chert quarry in Union County, Ill., by Dr. W. A. Phillips. The results indicate that, although the quarry was less extensive than some of those previously found in Ohio, Indian Territory, and Arizona, the site yielded vast numbers of the large and well-flaked flints scattered so profusely over the middle Mississippi Valley, and associated intimately with the ancient mounds. Important collections of technolithic artifacts were made also in Ohio by W. C. Mills, in Georgia by Robert Steiner, and in various parts of Canada by David Boyle and several collaborators, as well as in central California by W. H. Barr and Edward Hughes; the collections by the last-named investigator included several examples of beautifully chipped obsidian blades of curved form, supposed to have been used as surgical instruments. This supposition grows out of the researches of McGee in primitive trephining; and it is noteworthy that the mode of operation, inferred from the Peruvian crania, in connection with the known methods and motives of the aborigines, has been virtually established by Dr. Philip Mills Jones, of San Francisco, through experiments on (anæsthetized) dogs, conducted in the precise manner suggested by the archæologic studies. The instruments used were wholly of stone, the buttons removed were not replaced by plates, the integument was restored without stitching, and the animals treated recovered promptly and completely. Noteworthy publications on stone art have been made by Warren K. Moorehead, Thomas Wilson, J. D. McGuire, and others; the last-named author, in a memoir on pipes and smoking customs, pertinently suggests that several types of pipe hitherto deemed wholly prehistoric bear traces of Caucasian influence. The work of Harlan I. Smith, of the Jesup expeditions in British Columbia, also has thrown new light on the technology of certain Amerind tribes, particularly skilful in carving and other work with stone tools.

Fictile Artifacts.—During 1899 Dr. J. Walter Fewkes continued the arrangement and study of his unequalled pottery collections from the Pueblo country, and his researches have added materially to knowledge of the prehistoric technique and of the symbolism of the painted ware. He demonstrates that the ancient potters were organized into clans or gentes analogous to those of their modern descendants; that these kinship groups were distinguished by totems or crests, which at the same time represented zoic deities; that the finer ware was designed primarily for ceremonial use in connection with religious observances; and that the best examples were designed for sacramental purposes alone, and were eventually buried with the bodies of their owners, either intact or broken. Another noteworthy study of fictile work, by W. M. Beauchamp, was based on collections from central New York, including plain and decorated pots, pipes, totemic effigies, etc.; the work is specially significant as indicating that the motives so prominent in the minds of the Pueblo peoples were shared in little diminished intensity by the less sedentary tribes of the humid woodlands toward the Atlantic. In connection with the more highly differentiated fictile ware, the observations of Clarence B. Moore in southeastern United States are of interest; in excavating certain aboriginal mounds he found remains of walls made of wrought clay, evidently hardened into brick-like masses by the addition of a tempering or cementing substance, and by some drying or burning process. Of similar import are traces of ruined structures found in certain shell mounds of eastern Virginia in the form of small earthen bricks, samples of which have been placed in the National Museum by Dr. Anita Newcomb McGee; both the bricks and the clay walls suggesting structural devices on the Atlantic coast related to those so extensively developed in the arid regions of both Mexico and western United States.

General Artifacts.—Early in 1899 W. H. Holmes visited the remarkable ruin of Xochicalco ("The Hill of Flowers"), near Cuernavaca, Mexico, and made important observations on the ancient structure. The ruin occupies a hill, rising several hundred feet above the river washing its base, which has been literally remodelled from base to summit; wall upon wall of solid masonry face terraces encircling the entire hill, and the crest is crowned with remains of extensive temples and courts. One of the temples is fairly preserved; it is a single-story, flat-roof structure, about sixty by seventy feet, surrounded by a heavy cornice, rising from a pyramid sixteen feet in height, whose sloping sides are entirely covered by symbolic serpents carved in high relief, the ascent being by a wide stairway of carved stone. The tools with which the stone-cutters wrought were found in numbers; they are stone hammers, celts, etc., identical in character with those found on sites of stone-working throughout North America. Associated with these were fragments of pottery, both painted and plain; and traces in the ruins, as well as better preserved vestiges in adjacent caverns (artificial in part), indicate that both walls and floors were plastered. Studies of ancient structures were made also in the Pueblo country by George A. Dorsey, F. W. Putnam, F. W. Hodge, J. Walter Fewkes, and others; the general effect of these studies is to establish the unity of Amerindian architectural motives, save as diversified by local conditions. Noteworthy studies of the ruined structures of Honduras by M. H. Saville and others, under the direction of Professor Putnam, and certain of the surveys directed by Dr. Franz Boas, were of related import. Meantime, Cornelia Horsford continued investigations of the peculiar house remains of eastern Massachusetts, and, with the aid of expert collaborators from Denmark and Iceland, demonstrated that they are similar to the Norse ruins of Scandinavia and Iceland, and dissimilar from the known house types of the American aborigines. Researches in the aboriginal mounds have also been continued by various individuals and institutions; and there has been much interest in the aboriginal codices and other inscriptions, due largely to the continued munificence of Duc de Loubat in reproducing the more noteworthy codices, in fac-simile, for the benefit of libraries and students.

Evidences of Human Antiquity.—During the year Professor Holmes published the results of his researches and those of McGee and others in the Table Mountain region of California, while W. P. Blake published the record of his personal observations in connection with the Calaveras skull. The indications are now clear that the reporters of human relics in the auriferous gravels erred as to age of the deposits, which are for the most part middle or early Tertiary rather than Quaternary, as was at first supposed; also that the association of the relics with the auriferous deposits was frequently, if not always, adventitious, the commingling of surface materials and deep-lying gravels being due largely to conditions attending hydraulic mining; and hence that California yields no indubitable evidence of high human antiquity. Toward the close of the year Professor Putnam reported a human bone from deposits supposed to be late Quaternary in age at Trenton; this discovery is still under consideration. On the whole, the question of human antiquity in America remains open; there is a natural presumption that the hemisphere

has been inhabited by man since some time in the Quaternary or Pleistocene period; but the direct evidence of high antiquity seems inconclusive, and of decreasing weight with the increasing refinement of observation.

ARCHITECTS, AMERICAN INSTITUTE OF, founded in 1857, had in 1899 a membership of 400 fellows, 60 associates, 54 honorary and 66 corresponding members. General meeting for 1900 to be in Washington, D. C., in December. The Institute publishes annual *Proceedings* and a quarterly *Bulletin*. President, Robert S. Peabody; secretary, Glenn Brown, Washington, D. C.

ARCHITECTURE in the United States and England. The present article aims to give a brief sketch of the notable features in the progress of architecture in the United States and England, especially some of the signs of recent architectural progress, the awarding of prizes in important competitions, and the meetings of leading architectural societies.

Recent Progress in the United States.—A hopeful sign of improvement in the architecture of government buildings was the opening of the design of such buildings to competition under proper restrictions, instead of having the construction take place in all cases according to the design of the supervising architect of the Treasury Department—a practice that often resulted in stiff, machine-like designs. The higher grade of architectural work now being done in America and the good prospects for the future have been attributed largely to the training and influence of the architectural schools. Such schools have been established in a number of the universities and other institutions in the United States. Besides the advantages afforded therein to many students, travelling fellowships have brought some into close touch with the best foreign art; and, in addition, many of the younger architects have studied at the École des Beaux Arts, Paris. Another sign of progress is the growing spirit of co-operation between architects and engineers. Several papers on this topic were read during the year before architectural and engineering societies. The plea was made that engineers should pay more attention to æsthetics, calling in architects when necessary, and that architects should give more care to safe construction, good plumbing, heating and ventilation, turning over these problems to outside engineers or associating engineers with them in their work.

Competitions, etc.—One of the most notable events in the history of American architecture was the Phœbe Hearst prize competition for a magnificent group of buildings for the University of California, at Berkeley, Cal. After a world-wide competition a most capable jury awarded the first prize (\$10,000) to a Frenchman, M. Henri Jean Émile Bénard. All the other prizes went to America, as follows: (2) Howell, Stokes and Hombostel, New York, \$4000; (3) Despardelles and Stephen Codman, Boston, \$3000; (4) Lord, Hewlett and Hull, New York, \$1000. Competitions in the United States have often been conducted in a manner which gave no assurance of a just award and which granted no compensation to unsuccessful bidders. The Phœbe Hearst competition was a notable exception.

Meetings of Societies, etc.—The thirty-third annual convention of the American Institute of Architects was held in Pittsburg from November 13 to November 16, 1899. Mr. Henry Van Brunt, of Kansas City, Mo., and Mr. Glenn Brown, of Washington, D. C., filled the offices of president and secretary of the association. Mr. Van Brunt estimated that there are 5000 architects in the country, of which one-tenth are members of the institute. He referred to the fact that "there are now seven United States government buildings in different sections of the country being designed or built under the direction of private architects, instead of under the supervising architect of the Treasury Department, as formerly. He regretted that there are still so many competitions conducted without proper safeguards to the competitors, and that so many architects still enter such competitions." Among recent examples of properly conducted competitions, he mentioned that for the group of buildings for the University of California, under the Phœbe Hearst prize offer. Mr. R. S. Peabody, of Boston, was elected president. During the year permanent headquarters for the institute were established in The Octagon, Washington, D. C. The rules governing competitions have been modified, so as to make the compensation to competitors range from \$100 to \$1500, according to the importance of the work. Reports from the twenty chapters scattered over the country show that most of these chapters held successful meetings during the year. At the convention important papers were read on *Electricity in Modern Buildings*; *The Manufacture of Steel for Building Construction*; and *The Legitimate Design of the Architectural Casing for Skeleton Steel Structures*. Mr. C. H. Blackall, of Boston, favored the Italian Renaissance as the style most appropriate for the decorative treatment of a high building.

The Municipal Art Society, of New York, offered three prizes of \$300, \$200, and \$100 for designs for a public street transfer station, to be placed at the Central Park terminus of the Broadway line of the Metropolitan Traction Company. The

meeting of the Builders' Exchange, of Cleveland, was notable, and discussed the arrangement of new public buildings—a city-hall, a court-house, a public library, a post-office, and a government building. The Society of the Beaux-Arts offered prizes for competitions for a band-stand at a large seaside resort; a reviewing-stand on a large city square; an open pavilion in a large city park; and a boat-house and landing stage for a yacht club. The Boston Architectural Club met on October 2, 1899, and elected Edward H. Hoyt president. The Baltimore Architectural Club held its meeting on October 5, electing William W. Emmert president. During the season of 1898-99 the New York Chapter, American Institute of Architects, devoted a number of meetings to the presentation of plans for beautifying the streets, water-fronts and public buildings of New York. The jury for the architectural exhibit at the Paris Exposition, which convened at the American Fine Arts Building, New York, on November 4, 1899, consists of John M. Carrere, William R. Mead, Frank Miles Day, R. S. Peabody, and Cass Gilbert. The appointments on government architectural work made in October were the Custom-House in New York, to Mr. Cass Gilbert, of New York, and the Department of Justice Building, in Washington, D. C., to George B. Post, of New York.

England.—Architecture in England during 1899 was satisfactory, if not exceptionally brilliant with regard to the art of architecture or the business of architects. The most important event of the year was probably the production of the designs for the new government offices, by Mr. T. M. Brydon and Mr. W. Young, which an English critic said "will certainly add to the impressiveness of the official thoroughfare of the metropolis, without overwhelming or even conflicting with the notable buildings already existing in Whitehall and Parliament Street." During the year South Kensington has seen progress made toward the completion of the Victoria and Albert Museum and the Royal College of Science, both designed by Mr. Aston Webb. Manchester saw the opening of a "beautiful building, the Rylands Library, designed by Mr. Basil Champneys, enriched with sculpture and modelling by Mr. George Frampton, Mr. Cassidy and Mr. Bridgeman, and with stained glass by Mr. Kempe." The exhibition of the Royal Academy in its bearing on architecture indicated that the architects were chiefly interested in constructing domestic buildings. Only one government building was represented—Aston Webb's design for the Britannia Royal Naval College at Dartmouth. The style of design of the works shown at the Royal Academy and also by students' exhibitions in various educational centres showed very clearly that while the work of the eighteenth century furnished inspiration for the *fin-de-siècle* designs, there was a tendency, particularly among the younger men, to break away from conventional lines and aim at originality. Their taste tends toward a revival of the best Gothic style. Ecclesiastical building was on the wane. As an example of the poverty or callousness of the church in the past year in respect to the art of architecture, the scheme for the spoliation of the forecourt of the church of St. Dunstan in the West may be cited. Although, apparently, the Church cannot or will not find money for the erection of places of worship, it is remarkable that during the past year a tender of £18,967 was accepted for the erection of the archiepiscopal palace at Canterbury, and the commencement of the erection of a diocesan church-house at Liverpool. This condition led a critic to ask: "Are we face to face with a recrudescence of the spirit of the clergy of France during the early Renaissance period, which led them to build châteaux rather than churches?" A new cathedral was begun in Belfast. Mr. Thomas Drew, R.H.A., its architect, assisted by the advice of Mr. W. H. Lynn, R.H.A., has produced a remarkable plan, departing in motif from the mediæval cathedral type and adapted to the modern conception and use of a cathedral. The Building Trades Exhibition, at Agricultural Hall, London, was directed to the display of the practical and business side of architecture. The collection of specialties in building construction and material brought together was superior to anything of the kind ever seen in London, and reflected credit on its organizer, Mr. Greville Montgomery. The Furnishing Trades also held an exhibition at Agricultural Hall, and gave evidence of the triumph of the mercantile instinct over taste and beauty. The Sanitary Congress, held at Southampton, was important.

The architects shared in the general prosperity of the country during the first months of 1899, but the war checked building enterprises. Immense sums were expended upon asylums, workhouses, and hospitals, but the tremendous activity in the rebuilding of public houses and provincial theatres and music-halls collapsed. Striking examples of rebuilding in London include: The buildings of the Birbeck Bank, the Carlton Hotel, and the terminus of the Great Central Railway. The architectural societies flourished. The Royal Institute of British Architects numbers 1663 subscribing members. The Architectural Association at its opening meeting had a record membership of 1250. The British Fire-prevention Committee, connected with architecture, incorporated a valuable series of scientific tests of fire-resisting materials and construction. Iron, steel, hardware, and other building

materials were subjects that occasioned great interest and discussion. The principal competitions were: For fire-brigade station at Bradford, won by Messrs. Mawson and Hudson; for the Cartwright Hall, at Bradford, won by Messrs. Simpson and Milner Allen; for baths at St. Pancras, won by Mr. T. W. Aldwinckle; for municipal buildings at Plumstead, won by Mr. A. B. Thomas; for the offices of the Midlothian County Council, in which the assessor's award of first place to Messrs. J. N. Scott and A. Lorne Campbell was set aside by the County Council in favor of the design by Mr. J. Macintyre Henry. The most important competition of the year, that for the new Sessions House, Old Bailey, limited to six architects nominated by the Council of the Royal Institute of British Architects, still remains undecided, although the drawings have been sent in. Appointments of importance were: Mr. W. E. Riley, as superintending architect of the London County Council; Mr. C. E. Dance, as surveyor to the Metropolitan Asylums Board; and Mr. R. Elsey Smith, as professor of architecture at King's College.

ARCTIC EXPLORATION in 1899 was marked by much persistent and heroic effort, but few important new discoveries were made, and the "farthest north" point, $86^{\circ} 14'$, established by Professor Fridtjof Nansen on April 7, 1895, was not attained. The Americans, Lieutenant Peary and Mr. Wellman, reached the most northerly points, both being near the 82d parallel. The expeditions represented, besides the United States, Sweden, Italy, Denmark, Russia, and Monaco.

The experience of explorers has established as the best means of reaching the ultimate north the "dash-for-the-Pole" method. The old theory of a gradual approach from depot to depot lasting for many months has been abandoned. The reason is that there is no land extending near the Pole, and protracted sledge journeys cannot be made over the frozen sea. The two lands reaching nearest to the Pole are North Greenland and the islands of Franz-Josef Land, but so far as is known neither reaches nearer than about 450 miles. The problem, then, is to establish a base of supplies on the land as far north as possible—an undertaking that may occupy a year or two—and then traverse over the floe the remaining 450 or 500 miles as quickly as possible. There are two reasons for the necessity of this final "dash." First, it is almost impossible to travel over the frozen sea in the summer, not only on account of the melting condition of the surface, but on account of the dangers of the ice splitting and even breaking up; moreover, little sledge progress over the floe has hitherto been made during the winter—that is, the period of the polar night; hence, from the latter part of February to perhaps the middle of June—at most 125 days—is the only favorable time for proceeding beyond land. Secondly, as all equipment, provisions, and fuel must be carried not only for the advance but for the return, since it is useless to establish depots on the ever-shifting sea-ice, a rapid journey is necessitated by the limited carrying ability of the men and dogs. The subjects of special interest in Arctic exploration in 1899 are treated in the following paragraphs.

Andrée.—On July 11, 1897, S. A. Andrée with two companions left Dane's Island, about 80° N., in a balloon, with the hope of drifting across the Pole. Frequent rumors concerning him have appeared, but no definite and trustworthy information has been received after his pigeon-post dated July 13, 1897. Unconfirmed reports of a balloon having been seen and bodies found have come from both northern Asia and northern America. Several expeditions have made unavailing search along the coasts of Greenland and Siberia, but the only trace hitherto found of the Andrée balloon is a buoy picked up about September 11, 1899, at a point to the northeast of Spitzbergen, about 80° N. and 25° E. The buoy, which had been taken by Andrée for the purpose of dropping it with a letter in case he crossed the Pole, was identified at Stockholm on October 1. It contained no letter, and besides an anchor was attached. It is conjectured accordingly either that the buoy and anchor were thrown out to lighten the load and thus keep the balloon longer afloat, or that the latter has been lost in the sea while buoy and anchor floated away. Mr. Walter Wellman believes that Andrée and his two comrades "lost their lives by a descent of their air-ship into the waters of the Berents Sea, east of Spitzbergen and south of Franz-Josef Land, probably within ten or fifteen days after their ascension."

The Peary Expedition.—The *Windward*, returning from the North, reached Newfoundland in September, 1899, and reported that Lieutenant Robert C. Peary, who, in July, 1898, sailed for northern Greenland, whence he expected to make a dash across the ice for the Pole, had not succeeded in advancing beyond his previous farthest-north point. From August 18, 1898, to August 2, 1899, the *Windward* was frozen in at Allman Bay, Grinnell Land, $70^{\circ} 40'$ N., on the west side of Kane basin, and about fifty miles north of Cape Sabine. During this time Lieutenant Peary conducted a number of sledging journeys, that aggregated more than fifteen hundred miles, by which he added much to the geographical knowledge of that part of the polar regions. He explored and mapped large parts of Ellesmere Land and Grinnell Land, charting the coast-line north and west of Cape Sabine to

a point beyond Greely Fiord (about 80° N.), and definitely outlining the hitherto confused coast on the western side of Smith Sound, between Cape Sabine and Cape D'Urville. His discovery that Hayes Sound, northwest of Cape Sabine, supposed to be a continuous channel through to the Arctic Ocean, west of Ellesmere Land, is only an inlet, proves that the latter and Grinnell Land are parts of the same island. Lieutenant Peary was not able to establish his base of sledging operations at Sherard Osborn Fiord, on the north coast of Greenland, as he intended, but from his base at Allman Bay, on the west side of the main northward channel, he went north with Eskimos about two hundred and fifty miles across Grinnell Land and Grant Land, arriving in December, 1898, after great difficulties, at Fort Conger, General Greely's old headquarters, at Lady Franklin Bay, $81^{\circ} 44'$ N. This place had not been visited since Greely left in 1883, but the house was in good condition and the original records of the Greely party and many letters and papers were recovered. Four trips were made to Fort Conger, the work of mapping being continued and caches of supplies established along the route. Several members of the party were frost-bitten, and Peary himself suffered so severely that he was obliged to return to the *Windward*, where several of his toes were amputated. The most northerly point reached by Peary was Cape Beechey, about 82° N. When the ice opened in August, 1899, the *Windward* was sent back for a store of supplies; after being refitted the ship was to proceed north again as far as possible, and there probably remain until needed by Peary for his own return voyage. No effort was made by the Peary party in the summer of 1899 to push northward, and winter quarters for 1899-1900 were established on the Greenland side of Smith Sound, several miles farther south than the quarters on the west of the main channel during the previous year. It was expected that the attempt to reach the Pole would be made in the spring of 1900.

The Diana.—In the summer of 1899 the Peary Arctic Club sent the steam sealer *Diana*, 427 tons, north to communicate with Lieutenant Peary and land more than a year's supplies for the party. The ship crossed Melville Bay, and on August 12 found Peary at Etah. Aboard the *Diana* was a scientific party, headed by Professor William Libbey, of Princeton University, and Dr. Robert Stein, United States Geological Survey. The latter, with two companions, was landed at Cape Sabine, Ellesmere Land, where they expected to remain for one or two years. Apparently no definite plans were made for communicating with these men during 1900. Returning, the *Diana* coaled direct from the seams on Disco Island, and arrived at Sydney, Nova Scotia, on the 12th of September.

The Sverdrup Expedition.—Captain Otto Sverdrup, who sailed from Christiania on the *Fram*, June 24, 1898, in command of an expedition, wintered near Cape Sabine, about fifty miles south of Peary's ship, the *Windward*. During the winter the surgeon to the expedition died. The *Fram* was near Littleton Island, $78^{\circ} 25'$ N., on August 18, 1899, and small hopes were entertained of proceeding much farther before winter. Previous to this, Sverdrup had made some explorations in Ellesmere Land. He wishes to push his way north in the *Fram*, through Kane Basin, and thence northeast, across the north shore of Greenland, coming south again on the east side of the island, much of which is unexplored. Sverdrup's experience tends to confirm the opinion of Professor Nansen, that approach to the Pole by ship can be made most easily through the Siberian Arctic.

The Wellman Expedition.—The expedition, consisting of four Americans and five Norwegians, which, conducted by Mr. Walter Wellman, sailed from Tromsø, Norway, on June 26, 1898, in the ice-steamer *Fridtjof*, returned to that port on the *Capella* August 17, 1899, after passing the winter in Franz Josef Land. Mr. Baldwin, meteorologist from the United States Weather Bureau, and Mr. Harlan, the physicist, accompanied the expedition; but Professor Gore, of Washington, who had intended to go, was unable to do so. The party was well equipped and had eighty-three Siberian dogs, which were taken aboard at Archangel. The *Fridtjof* then steamed northward until the pack-ice was encountered on July 9, near the 77th parallel of latitude. The supply of coal running short, the ship was obliged to put back to Norway; but by July 20 had again reached the ice, through which it finally succeeded in finding a channel, and on the 27th Franz Josef Land was sighted. Unable to make much progress through any of the channels of the Franz Josef archipelago, the party established winter quarters at Cape Tegetthoff, 80° N., on the southern part of Hall Island, and the *Fridtjof* sailed for home on August 3, 1898. Almost immediately a small party set out to establish a depot as far north as possible. After a struggle that lasted a month they reached Cape Heller, about 81° N., where a hut was built, which was named Fort McKinley, and was left in charge of two Norwegians, Paul Bjoervig and Berut Bentzen, both experienced Arctic travellers. It was only a few miles from Fort McKinley that Nansen and Johansen passed the winter of 1895-96.

For the rest of the party a hut was built at Cape Tegetthoff. Here during the winter Mr. Baldwin and Mr. Harlan carried on a series of scientific observations,

giving especial attention to the study of the aurora borealis and making continuous barograph, thermograph, and anemometric records; while Dr. Edward Hofma, naturalist and surgeon to the expedition, made a study of flora and fauna. Before the sunless period, which lasted one hundred and twenty-seven days, had expired, Mr. Wellman and three Norwegians, on February 18, 1899, set off for Fort McKinley, which was reached about the end of the month after a journey of great difficulty. Here they found that Bentzen, having fallen ill in November, had died on January 2, and that Bjoervig having promised his dying companion that "the bears and foxes shouldn't get him," had kept watch over the body through two months of the Arctic night.

After the burial of Bentzen the sledging journey northward was resumed, and by March 20 a point was reached on the floe off the east coast of Rudolf Land, near the 82d parallel. At this time the prospects, if not of reaching the Pole, at least of going beyond Nansen's "farthest-north" point, $86^{\circ} 14'$, were very good; an accident, however, brought the party disappointment. Mr. Wellman fell into a crevice and injured his leg so severely that the men were soon forced to turn back and drag their leader two hundred miles to Cape Tegetthoff, where they arrived on April 9, 1899. Subsequently, Mr. Baldwin led a party through parts of Franz Josef Land and made some new maps and charts; after the arrival of the *Capella*, which was sent after the expedition, some twenty new lands or islands of the archipelago were discovered. As the party were leaving on the *Capella* they met, August 9, the Abruzzi expedition, which was in search of winter quarters, and expected to make a dash for the Pole in the spring of 1900.

The Abruzzi Expedition.—On June 12, 1899, the Duke of Abruzzi sailed from Christiania on the *Stella Polare* in command of an expedition whose purpose was to find the Pole. The party expected to winter in Franz Josef Land and start northward in the spring of 1900. On its return the Wellman expedition in the *Capella* met the *Stella Polare* on August 9, 1899, in the British Channel, lat. $80^{\circ} 20'$, with good chances of proceeding some twenty or thirty miles farther north before stopping for the winter. It was reported that subsequently a pigeon-post from Abruzzi stated that he was passing the winter near the site of "Nansen's hut," on one of the islands of Franz Josef Land, not far from the 81st parallel. The party had an exceedingly good equipment, including 120 dogs, and it was believed by Mr. Wellman that of the several explorers in the Arctic regions at the close of 1899, Abruzzi had the best chance to advance beyond the "farthest north" point of Professor Nansen.

The Nathorst Expedition.—In May, 1899, Dr. A. G. Nathorst, who in 1898 conducted an expedition to Spitzbergen, sailed for East Greenland, primarily for the purpose of finding some trace of S. A. Andrée, the balloonist. The secondary object of the expedition was one of exploration and discovery. On returning in September, Professor Nathorst reported that no trace of Andrée had been found, but that successful explorations had been made in the region of Franz Josef Fiord. His investigations completely changed the map of this fiord. The coast was further charted, many new inlets and a magnificent new fiord, which was named for King Oscar, were discovered, geological investigations were made, and a valuable ethnographic collection was secured.

The Monaco Expedition.—In 1899 the Prince of Monaco again conducted an expedition to Spitzbergen in his yacht the *Princesse Alice*; he succeeded in accomplishing some oceanographical work, and in making a number of very good surveys of parts of the coast.

The Andrup Expedition.—In August, 1898, Lieutenant Andrup left Copenhagen in command of a Danish expedition to the polar regions. The party returned in September, 1899, after exploring the Greenland coast from Agmasalik, $65^{\circ} 45' N.$, to a point $67^{\circ} 30' N.$

The Russian Ice-Breaker.—The success in 1899 of the *Ermak*, the recently constructed Russian ice-breaker, in forcing a passage through polar ice, points to a new method, in the opinion of a number of experts, of attempting to reach the ultimate north. Though ice-breakers have been constructed for over thirty years, especially for keeping open Russian ports, none have achieved such eminent success as the *Ermak*. This vessel, which was built at Walker-on-Tyne, is 305 feet long, 71 feet wide, and 42 feet 6 inches deep, and has a displacement, with 3000 tons of coal on board, of 8000 tons. It is a quadruple-screw steamer, having at the stern, besides the ordinary single screw on the centre line, twin-screw propellers, and a screw at the bow. The bow-screw is not designed for accelerating the speed of the vessel, but for clearing away loose masses of ice that tend to accumulate under the ship. The steel hull of the *Ermak* is so modelled that lateral pressure tends not to crush but simply to lift up the ship. Its method, accordingly, of forcing a way through an ice-bound harbor, is not to cut the ice, but to run the prow upon it and break it by the weight of the vessel. The *Ermak* has already done good service in

opening several of the Russian ports, and it was for this purpose, especially for keeping open in winter a passage from St. Petersburg through the Baltic, it was designed by Vice-Admiral Makaroff, of the Russian navy.

To submit the ice-breaker to a most severe test, and with the hope of demonstrating a new method of Arctic exploration, Admiral Makaroff for five weeks in July and August, 1899, experimented in the floe north of Spitzbergen, pushing through 230 miles of polar ice, which was first struck by the ship in latitude $80^{\circ} 15'$. The ship with little difficulty stood through plain ice 10 feet in thickness, and finally succeeded in overcoming plain ice of 14 feet; while satisfactory progress was made through pack-ice that was sometimes 18 feet high and 42 feet deep. In her trials in the North Sea the *Ermak* reached a speed of nearly $15\frac{1}{4}$ knots with 8000 horse-power; the usual rate in the polar regions was $3\frac{1}{2}$ knots. So successful was Admiral Makaroff that he believes a ship of the character of the *Ermak*, with some improvements that can be made, could navigate almost any part of the Arctic waters.

ARECOLIN. To an alkaloid obtained from the areca nut has been given the name arecolin. The hydrobromate of arecolin is a white, crystalline, soluble salt, which is used in medicine. When applied to the eye in the form of a 0.5 per cent. or 1 per cent. aqueous solution, contraction of the pupil results, says Clemensha, in *Buffalo Medical Journal*, 1899. A 0.5 per cent. solution, dropped into the conjunctival sac, causes burning and slight congestion. In from three to five minutes the pupil begins to contract, and its maximum contraction is reached in from ten to fifteen minutes, accompanied by spasms of the ciliary muscle. After this the contraction ceases and the pupil returns to its normal condition, usually in the course of an hour or two. In the normal eye tension is apparently unaffected, but in glaucoma the drug appears to be the equal of eserine in its action—that is, it contracts the pupil strongly, drawing away the base of the iris from the angle of the anterior chamber, thus relieving tension.

ARGENTINA, a republic of southern South America, is bounded on the north by Bolivia and Paraguay; on the east by Paraguay, Brazil, Uruguay, and the Atlantic Ocean; on the south by the Atlantic Ocean and Chile, and on the west by Chile. Its capital is Buenos Ayres, a port at the mouth of the river Plata.

Area and Population.—The estimated area of the 14 provinces and the municipality of Buenos Ayres in May, 1895, was 515,815 square miles, and of the 9 territories, 1,262,380, making a total area of 1,778,195 square miles. The largest province is Buenos Ayres, exclusive of the city, which comprises 63,000 square miles; and the smallest is Tucuman, a northern province, with 13,500 square miles. Of the territories, Santa Cruz has the largest area, with 182,500 square miles; and Terra del Fuego, the smallest, with 13,000. The total population of the country in 1899 was estimated to be over 4,000,000. According to the census of May, 1895, the population was 3,954,911, of which only 103,369 were reported from the territories; the males numbered 2,088,919, and the females 1,865,992. The population per square mile is largest in the province of Santa Fé, 22; and smallest in the territory of Santa Cruz, 0.005. There are about 30,000 Indians. The city of Buenos Ayres, which governmentally is separate from the province of the same name, had in 1895 a population of 663,854, or 5784.7 per square mile; in May, 1899, its population had increased to 776,325. This is the largest city in South America. Other cities, with populations from the census of 1895, are: Rosario, 94,025; Cordoba, 47,609; La Plata (the new capital of the province of Buenos Ayres, founded in 1884), 45,410; Tucuman, 34,300; Mendoza, 28,709; Santa Fé, 24,755; Paraná, 24,261; Salta, 16,600; Corrientes, 16,129; San Juan, 10,410; San Luis, 9826. Immigration into Argentina has been fluctuating, but from 1891 to 1896 there was an annual increase. In the latter year the immigrants (exclusive of the passengers from Montevideo, who are not usually counted among immigrants) numbered 102,673; including the passengers from Montevideo, 164,218; the emigrants numbered 20,415. In 1897 the immigrants numbered 72,978, of whom 51,547 were males and 21,431 females; of the total, 38,745 were Italians, 13,059 Spaniards, 7813 French, 1876 Germans. The emigrants for this year numbered 31,192. The whole number of immigrants for the term of years 1873-97, inclusive, was 2,063,232. The foreigners in Argentina in 1895 numbered 886,895, representing various nationalities, as follows: Italian, 402,636; Spanish, 198,685; French, 94,098; English, 21,788; German, 17,143; Swiss, 14,789; Austrian, 12,803; Portuguese, 2269; other nationalities, 32,184.

Government.—The constitution of "La República Argentina" is dated May 15, 1853, and was modified in 1860, when Buenos Ayres joined "Las Provincias Unidas del Río de la Plata." By the provisions of the constitution, which, with minor exceptions, is like that of the United States, the executive authority is vested in a president, elected for a term of six years by representatives of the fourteen provinces, comprising twice the number of federal senators and deputies combined.

Appointed by the president and acting upon his orders, is a ministry, which with himself is responsible to congress, consisting of eight secretaries of state—namely, for the interior, foreign affairs, justice, agriculture, finance, war, marine, and public works. The president is commander-in-chief of the army and has appointive power to all military, judicial, and civil offices. He is not eligible for re-election. In 1899 Señor Don Julio A. Roca was president; he took office October 12, 1898. The legislative authority devolves upon a congress, consisting of a senate and a house of deputies. The members of the former are 30 in number, and are chosen, two from each province and the municipality of Buenos Ayres, by the legislatures in the provinces and by an electoral college in the municipality. The deputies, numbering 133, each of whom by the constitutional revision of 1898 represents about 33,000 inhabitants, are elected by direct popular vote. Deputies are chosen for a term of four years, half of the number retiring every two years; the senatorial term is nine years, one-third of the senators retiring every third year. Both deputies and senators receive 12,000 pesos a year; senators must be at least thirty years of age and have an annual income of at least 12,000 pesos. The vice-president, who is elected in like manner and at the same time as the president, has no political authority other than that attaching to the chairmanship of the senate. The several provinces have full autonomy so far as their action does not conflict with the federal government; they may contract internal and even external debts on their own responsibility. Their governors and legislatures are elected by popular vote. The federal judiciary consists of a supreme court of five judges and an attorney-general. The several provinces have their own judicial systems. The constitution provides for trial by jury in criminal cases.

Army and Navy.—On a peace footing the army comprises 945 officers and 12,073 privates; a statement made to congress in 1897 places the number of the effective army at 29,513 officers and men. The majority of the national guard, which is reported to number 480,000, are drilled each year. Besides a school for non-commissioned officers, there is a military school, having 125 cadets.

The Argentine navy ranks third in South America, being excelled only by those of Brazil and Chile. It consists of 6 armored cruisers, 3 high-speed, second-class cruisers, 4 coast-defence armorclads, 7 comparatively small but modern cruisers and gunboats, 12 first-class and 10 second-class torpedo boats, 3 destroyers, and several old gunboats. The armored ships are as follows (the first two are coast-defence vessels, the others cruisers): *Libertad* and *Independencia*, launched at Birkenhead in 1890 and 1891, respectively; *Almirante Brown*, built at Poplar in 1880; *Garibaldi*, launched in 1895; *San Martin*, launched in 1896, and *General Belgrano* and *Pucyrredon*, both launched in 1897, and *Rivadaria*. The last-named vessel was built for Spain and the four preceding for Italy. They were purchased by Argentina with the consent of those governments. These vessels are well armed and equipped with modern appliances. Other ships in the navy, including protected cruisers, also have a high degree of efficiency. The government has undertaken to increase the size of the navy. Besides marines, the naval complement is reported to number 4642 officers, engineers, and seamen. There is a naval school with 60 cadets and a school of gunners with 80.

Finance.—The chief sources of revenue are import and export duties, internal taxes, stamps, railways, and public works; the heaviest item of expenditure is interest on the national debt. For 1898 the estimated revenue was 34,759,146 pesos gold and 52,918,000 pesos paper; the estimated expenditure was 22,100,182 pesos gold and 97,881,111 pesos paper. The estimates for 1899 were: revenue, 32,423,500 pesos gold and 67,540,600 pesos paper; expenditure, 29,070,173 pesos gold and 75,782,687 pesos paper.

Separate from the national budget is that of each province and municipality. A law for the unification of the national and provincial foreign debts was enacted in 1896, in pursuance whereof there was subsequently authorized an issue of 4 per cent. bonds for nearly \$33,000,000 for the conversion of the external debt of the province of Buenos Ayres.

The national external debt was in July, 1898, \$301,454,714. A proposed issue of bonds, amounting to \$48,427,757, would bring the total external debt up to \$349,882,471. The amount of this new bond issue was made up of \$32,853,166 for the conversion of the Buenos Ayres provincial debt, \$8,859,017 for the recision of railway guarantees, and \$6,715,574 for the conversion of the Buenos Ayres city debt. The internal debt at the beginning of 1897 amounted to 189,162,500 pesos gold and 45,838,067 pesos paper. Internal bonds in 1898 were issued for military and naval purposes, amounting to 39,000,000 pesos, and for the liquidation of the debt of the department of education internal bonds, amounting to 6,000,000 pesos. In November, 1898, it was reported that the total public debt amounted to £105,000,000 (\$510,930,000).

In the spring of 1899 the government decided to take measures for placing the currency on a gold basis. The notes in circulation amounted to 292,000,000 pesos, and the sum estimated to effect the conversion was 146,000,000 pesos gold. Some authorities considered the plan impracticable, since the annual interest on the gold sum—about \$7,500,000 gold—would be greater than the government could bear, in addition to the other heavy expenditures. For in the summer a great popular protest was made against the heavy taxation already imposed, and a petition, signed by 50,000 people, asking for reforms in the customs laws, etc., was presented to the congress. On October 27, however, though nothing of importance was done to effect economies or reduce taxation, the Chamber of Deputies passed a conversion bill, "the main object of which is to arrest the further appreciation of the currency, to sell the Transandean Railway, in the hope of receiving thereby £1,400,000, to issue £1,500,000 national *cédulas* [notes] in the London market, and, lastly, to negotiate over £1,000,000 of home debt stock of 1891."

Besides numerous private banks and the Bank of the Argentine Nation, there are 14 state banks. In August, 1897, the paper currency of the country amounted to 285,115,964 pesos; the total coinage up to 1899 has been reported as 31,716,545 pesos gold and 2,805,840 pesos silver. The value of the peso is \$0.965 United States currency.

Industries.—Cattle raising is the most important industry; agriculture ranks second, and efforts are being constantly made for its development. Of the 240,000,000 acres of tillable land in the republic there were under cultivation in 1896 only about 15,000,000 acres. The leading crop is wheat; others of importance are maize, grapes, sugar, and flax. The four principal cereal-producing provinces are Santa Fé, Buenos Ayres, Cordoba, and Entre Rios. The wheat area is gradually increasing, chiefly toward the south, where there is greater security from the locust pest than in the northern districts. The total wheat crop of 1899 was estimated to be 2,200,000 tons and the export 1,400,000 tons. The amount of corn exported and ready for export was placed at 2,000,000 tons. Rivalry between the United States and Argentina in the export of wheat and Indian corn is increasing. Three of the chief wool-producing districts of the world are Australia, South Africa, and the Plata regions of Uruguay and Argentina; in the former districts there has been a great decrease, but in the latter district an increase of the sheep stock. The present number of sheep in Argentina is placed approximately at 85,000,000; in Uruguay, 17,000,000; this is an increase for the two countries since 1890 of over 20,000,000. Rich deposits of borax, borate of soda, and borate of lime have been discovered in the provinces of Salta, Jujuy, and Atacama, on the Chilean frontier; and though exploitation has begun, the industry has not yet been well developed. In the summer of 1899 a flood in the Chubut valley did great damage to property and caused much distress.

Commerce.—The chief exports of Argentina are the produce of the herds and agricultural products, notably wheat and maize; the leading imports are textiles and wearing apparel, iron, and iron and steel implements, and machinery. The value, in gold pesos, of exports and imports, exclusive of coin and bullion, has been:

	1897.	1898.
Exports, dutiable.....	61,855,000	71,472,647
“ free.....	39,314,299	62,356,811
Total.....	101,169,299	133,829,458
Imports, dutiable.....	85,699,748	93,988,545
“ free.....	12,589,200	13,440,355
Total.....	98,288,948	107,428,900

Exports and imports for the first six months of 1899 were reported at \$89,050,762 and \$57,452,942 respectively. Of the exports about 67 per cent. and of the imports about 85 per cent. pass through the port of Buenos Ayres. The trade for 1898 by countries was in gold pesos: Exports to France, 29,981,056; Germany, 20,286,338; Great Britain, 19,205,908; Belgium, 13,949,751; Brazil, 7,916,301; United States, 5,874,295; Italy, 5,256,054; the remainder, in smaller amounts, to various other countries: imports, from Great Britain, 39,012,600; Italy, 13,695,241; Germany, 12,571,116; United States, 11,129,075; France, 10,596,725; Belgium, 9,444,981; Brazil, 5,012,115; the remainder from other countries. In 1898 about 4½ per cent. of the total Argentine exports went to the United States, the remainder going chiefly to Europe. Of the total imports about 10½ per cent. came from the United States. Some of the important exports in 1898 are reported as follows: Wheat, 645,161 tons;

maize, 717,105 tons; linseed, 158,904 tons; flour, 31,933 tons; hay, 113,534 tons. The total exports of wool in 1897 amounted to 469,451 bales; in 1898, 514,773 bales. Near the close of the year it was estimated that the value of the wool exported during 1899 would be about \$70,000,000, gold. In the first half of 1899 there were exported 1,078,819 tons of wheat. During the same time there was a general falling off in pastoral produce, hides, skins, etc. The number of cattle slaughtered in Argentina for packing purposes in fiscal years has been reported as follows: 1896, 449,400; 1897, 476,200; 1898, 337,500; 1899, 310,700. Statistics, based on the returns for the first six months of 1899, indicate that the total trade of Argentina for the year amounted to about \$293,000,000, gold. In the summer of 1899, after the outbreak of bubonic plague at Oporto, Portugal, the Argentine government established a strict quarantine, which caused much inconvenience to travel and commerce.

Shipping.—Vessels engaged in the foreign trade at the Argentine ports numbered in 1896: Steam, 7791, aggregating 6,331,879 tons; sail, 4039, aggregating 783,588 tons; total, 11,830 vessels of 7,115,467 tons. In 1897: Steam, 6827, of 5,522,973 tons; sail, 3536, of 541,091 tons; total, 10,363 vessels, aggregating 6,064,064 tons. The Argentine merchant marine in 1898 consisted of: Steam, 86 vessels, of 31,976 tons net, and sail, 157 vessels, of 39,695 tons net.

Communications.—Toward the close of 1899, the railroad mileage for Argentina was reported at 15,884 kilometres (9870 miles), giving this country the seventh position in the world. Austria-Hungary, occupying the sixth position, has 31,794 kilometres (19,756 miles), and Brazil and Mexico, eighth and ninth, have 14,035 kilometres (8722 miles) and 13,369 kilometres (8307 miles) respectively.

Buenos Ayres is connected by rail with the principal cities of the country. In 1896 the capital invested amounted to 510,643,296 pesos gold; the gross receipts were 31,238,326 pesos gold, and the expenses 15,934,466 pesos gold. Some lines are under federal control, some under provincial, and some under private. It was announced in the summer of 1899 that the construction of a network of underground electric railways would be attempted in the city of Buenos Ayres. In 1896 there were 25,345 miles of telegraph lines with 59,060 miles of wire. There were in Buenos Ayres in 1899, 362 kilometres (225 miles) of horse railways and 63 kilometres (39 miles) of electric railways.

Education.—An educational system similar to that of the United States was introduced in Argentina in 1868 by Don Domingo F. Sarmiento, formerly minister to the United States, who was elected president in that year. The latest report of the United States Commissioner of Education states that \$17,551,363, or six per cent. of the national revenue, was spent by the nation in education of all grades. Over five million and a half of dollars was appropriated for secondary, higher and special education, including the universities of Buenos Ayres and of Cordoba, 2838 public schools, with secondary and 37 normal schools, a school of mines, two schools of commerce, one with an industrial department, an institution for deaf mutes, and a school for pilots. Private schools bring the total of schools of all kinds up to 3986. There were 365,841 pupils and 10,295 teachers in the public schools. The kindergarten has been introduced in the primary schools, and the regular course of public school education includes reading, arithmetic, history, geography, natural sciences, drawing, writing, geometry, music, manual training, hygiene, and the French and Spanish languages. A commercial school was opened in July, 1897, in Buenos Ayres with a two-year course of study, which included bookkeeping and typewriting. The school for pilots was founded in 1895, and has matriculated 50 pupils. "There is a three-year course of study, as follows: First year, elementary mathematics, arithmetic, algebra, and geometry, rigging, and the national language; second year, navigation by dead reckoning, rigging, natural geography and history, English, plane and spherical trigonometry; third year, navigation by astronomy, meteorology, rigging and working ship, universal geography and English. On the termination of the annual examinations the pupils make a practice voyage, and, if possible, by consent of the Minister of Marine, make two round trips to the Straits of Magellan, or if that be not possible, the director of the school obtains permission from the minister for them to make a voyage on the national practice-vessel. The director, subdirector, or one of the professors accompanies the pupils on the voyage, and uses every opportunity of instructing the pupils. On the termination of the voyage the director makes a report to the minister of the time employed in the various exercises and names pupils who are worthy of promotion. The pupils in the second year must always keep the dead reckoning of the ship, and those of the third year take astronomical observations to determine the vessel's position. Both the second and the third year pupils must take meteorological observations, and learn while on board the principles of meteorology and the use of the signals of the international code."

The Argentine-Chilean Boundary.—In the fall of 1898 commissioners were ap-

pointed to investigate the disputed question of the Argentine-Chilean boundary, and they subsequently failed to reach an agreement. The demarcation of Puna de Atacama was submitted to the arbitration of Mr. William I. Buchanan, United States Minister at Buenos Ayres. Bolivia had ceded to Argentina the territory in dispute. Chile demanded that it be divided, while Argentina claimed a right to the whole. The decision awarded Chile about eight hundred leagues, or one-fourth of the disputed territory. In 1898 the Chilean-Argentine dispute concerning the boundary to the south of the Atacama district was submitted to the arbitration of the British government; on February 15, 1899, this government appointed as arbitrators Baron Edward MacNaghten, General Sir Charles Ardagh, and Colonel Sir Thomas H. Holdich.

Official Visit.—In the summer of 1899 an Argentine delegation, headed by President Roca, paid an official visit to the president of Brazil. On August 8 they were welcomed at Rio de Janeiro, and festivities were arranged to last for nine days. On the way President Roca had called upon President Cuestas at Montevideo. These two incidents caused a rumor of a political alliance between the countries, but when the Argentines left Brazil it was believed that none had been effected.

Researches in Patagonia.—Scientific exploration in Patagonia was continued in 1899 by Professor J. B. Hatcher, of Princeton University, who returned to the United States in August. His assistant, Mr. O. E. Peterson, returned the following month. The exploring party, after reaching the Straits of Magellan, established its headquarters at Sandy Point. Proceeding from this place, the scientists made careful observations of the geological formation of the country, with special reference to vertebrate and invertebrate fossils. This primary object of the expedition was highly successful in the collection of a large number of fossils; in addition, many ethnological, zoological, and botanical specimens were taken. In the interior of the country the party found the first Mesozoic mammals ever discovered, and about thirty cases of vertebrates of the Mesozoic period were shipped to the United States. Hitherto an insufficient number of specimens from this region of the far south has rendered inadequate a scientific comparison between the Northern and Southern forms, and it is now thought that the results of the expedition will settle a number of geological and paleontological questions that have been matters of controversy. Professor Hatcher also obtained valuable information concerning the Patagonian natives. Mr. Peterson, whose additional investigations were made along the seacoast, secured a rare and valuable collection of bird and fish fossils.

ARID LANDS. See IRRIGATION.

ARIZONA, a southwestern Territory of the United States, has an area of 113,920 square miles. The capital is Phoenix. Arizona was organized February 14, 1863.

Agriculture.—The principal crops of the calendar year 1899 were wheat, 342,139 bushels, valued at \$218,969, and hay, 72,651 tons, valued at \$751,938. Live stock, January 1, 1900, comprised horses, 52,431, \$1,417,338; mules, 1,031, \$38,477; milch cows, 19,140, \$622,050; other cattle, 362,721, \$5,969,293; and sheep, 1,024,430, \$2,393,581.

Mining.—Never before in the history of the Territory was there so much interest manifested in mines and mining as during the calendar year 1899. Copper continued to show the most active development. Almost every copper mine and smelter were worked to their full capacity, and the railroads handled nearly eight times as much ore as in 1896 and 1897. From January till June more mines changed hands in Pima County than during the previous ten years, and from January till October 250 mining claims were recorded in Gila County alone. Fully 16,000 men have been constantly employed at good wages in Arizona's copper mines and smelters for two years, and almost weekly strikes in various counties promise a prolonged era of prosperity.

One of the most notable movements in mining properties was the sale of the Helvetia group of mines to a corporation for \$4,490,000. The great United Verde mine at Jerome, owned by United States Senator Clark, of Montana, is now considered the most profitable mining property in the world. The main production is copper, but the ore is known to contain high values in gold and silver. In copper alone the monthly output exceeds \$1,000,000, and in 1898 the net profit was \$8,600,000. Senator Clark, who has spent millions of dollars on his plant, has refused \$100,000,000 for the mine and its works. The deepest workings are now 700 feet, but an exploration in 1899 by means of a drill showed a continuation of the ore body to a depth of 2000 feet.

Gold-mining on a large scale was undertaken in the Cañon Del Oro country, in which early Mexican prospectors had acquired interests. These and some adjoining interests were bought up by a capitalist, and by midsummer fully 50 claims had been staked out in this one belt. Late in the year a new platinum and aluminium

strike was made in Cataract Cañon, in a clay deposit. Samples assayed \$328 in platinum and 28 per cent. aluminium. A number of abandoned copper and gold claims in the Dragon Mountain region were opened up during the year, and with modern methods yielded profitable results. An important discovery was that of anthracite coal, comparing favorably with the Pennsylvania product, near the border of Arizona and Sonora.

Probably the most valuable discovery of the year was that established through the agency of the Arizona School of Mines. Samples of nuggets found in large quantities in the Dragon and Gila mountains were determined to be wolframite, from which tungsten is produced. Prospecting showed that this mineral is not found elsewhere in the world in so large quantities. The total annual product has not exceeded 1000 tons, and the demand is always far ahead of the supply. The largest known body of wolframite is believed to be that in the Gila Mountains, near Arivaca, and it is supposed that this region alone is capable of yielding several times more than the present entire output of the world.

Commerce.—In the fiscal year ending June 30, 1899, the imports of merchandise in the customs district of Arizona were valued at \$1,485,231, a decrease in a year of \$272,191, and the exports were valued at \$1,518,380, an increase of \$329,999. The imports of gold and silver amounted in value to \$3,005,782, an increase of \$306,156, making the total trade of the year \$6,009,393.

Railways.—The total new railway construction during 1898 was reported at 99.40 miles, giving the territory a mileage of 1416.18 in 1899. This mileage is believed to be below the actual total, for, in addition to extensions of trunk lines, there was a large construction to aid the development of mining property.

Banks.—On October 31, 1899, there were 5 national banks in operation and 3 in liquidation. The active capital aggregated \$400,000; circulation, \$166,528; deposits, \$2,062,181, and reserve, \$795,087. Territorial and private banks numbered 3, and had capital, \$229,700; deposits, \$1,368,007, and resources, \$1,671,768.

Education.—Revised reports for the school year 1897-98 show a school population of 22,120, an enrolment of 14,613, and an average daily attendance of 9011. The revenue was \$235,381; expenditure, \$229,323, of which \$175,031 was for teachers' salaries. There were 2 public high schools, with 8 teachers and 156 students; 1 private secondary school, with 2 teachers and 8 secondary students, and 70 elementary pupils; and 1 public normal school, with 6 teachers and 171 students. The University of Arizona, at Tucson, reported 14 professors and instructors, 157 students, 3400 volumes in the library, \$40,000 invested in scientific apparatus, and \$85,000 in grounds and buildings, and \$48,700 in total income. In 1899 there were 52 periodicals, of which 10 were dailies and 40 weeklies.

Finances.—In 1899 the assessed property valuations aggregated \$32,509,520, an increase in a year of \$1,036,161, and the Territorial tax rate was \$8.50 per \$1000. The total debt, April 1, 1899, was \$2,855,237, including a floating debt of \$152,237, from which should be deducted the aggregate of county, city, and school district debts, \$1,634,028, leaving the net territorial debt, \$1,221,209, less cash in the general fund, \$82,755. The last official estimate of actual property valuations was in 1896, when, excluding mines in operation, the total was given as \$64,000,000.

Needs of the Territory.—Governor Murphy, in his annual report for 1898-99, renewed his plea for Statehood, and made a number of recommendations which he deemed necessary for the welfare of Arizona, whether it remained a Territory or became a State. Among these were that all public lands within Arizona be ceded to the Territory or State, pending which the Territory should be permitted to lease the grazing lands; that all lands within the Territory, especially the railroad grants, be surveyed for taxing purposes; that a mint or assay office be established; that a commission be created by Congress for ethnological and archaeological research, also, a fifth judicial district; and that Congress appropriate sufficient money to pay territorial governors and secretaries the salaries allowed them by law.

Population.—As estimated by federal officials, the population on June 30, 1899, was about 83,000.

Legislation.—The age of consent was raised from fourteen to seventeen years. Eminent domain was granted to pipe-line companies. The amount of property exempt from taxation belonging to heads of families was reduced from \$1000 to \$500, and homesteads from \$4000 to \$2500. It was made a misdemeanor to deface or show disrespect to the national flag. Property acquired by either husband or wife during marriage was declared common property, only to be alienated by both joining in the deed. Attendance at school was made compulsory. Railroads commenced within one year and constructed at the rate of twenty-five miles each year are to be exempt from taxation for ten years, and when canals and reservoirs for distribution of water for mining, manufacturing, and agricultural purposes shall be commenced within one year, they shall be exempt for fifteen years.

Territorial Officers and National Representative.—Governor, N. O. Murphy; secretary, Charles H. Akers; treasurer, T. W. Pemberton; auditor, G. W. Vickers; adjutant-general, H. P. Robinson; attorney-general, C. F. Ainsworth; superintendent of education, R. L. Long. Supreme Court: Chief Justice, Webster Street; associate justices, Richard E. Sloan, Fletcher M. Doan, George R. Davis; clerk, Lloyd Johnston. Delegate to Congress, J. F. Wilson (Dem.), from Tucson. The territorial legislature consists of 22 Democrats and 14 Republicans.

ARIZONA ANTIQUARIAN ASSOCIATION. See ANTHROPOLOGY IN AMERICA.

ARKANSAS, a south central State of the United States, has a land area of 53,045 square miles. The capital is Little Rock. Arkansas was admitted to the Union June 15, 1836.

Agriculture.—The following shows the production and value of the principal crops in the calendar year 1899: Corn, 48,087,140 bushels, \$18,273,113; wheat, 1,953,361, \$1,250,151; oats, 5,964,442, \$2,027,910; potatoes, 1,773,198, \$1,258,971; rye, 19,052, \$14,098; and hay, 205,491 tons, \$1,777,497. The farm animals, January 1, 1900, comprised horses, 234,127, \$7,817,264; mules, 142,594, \$6,348,660; milch cows, 188,936, \$3,825,954; other cattle, 230,486, \$3,235,910; and sheep, 108,957, \$181,795. See COTTON AND THE COTTON INDUSTRY.

Banks.—On October 31, 1899, there were 7 national banks in operation and 7 in liquidation. The active capital aggregated \$1,070,000; circulation, \$242,548; deposits, \$2,651,582, and reserve, \$881,030. The State banks, June 30, 1899, numbered 37, and had capital, \$1,152,914; deposits, \$3,730,329, and resources, \$5,712,601.

Education.—At the close of the school year 1897-98, the school population was 465,565; enrolment in public schools, 303,808, and average daily attendance, 191,447. There were 7073 teachers, 4936 buildings used as schoolhouses, and public school property valued at \$2,294,397. The revenue was \$1,255,446; expenditure, \$1,220,362, of which \$1,065,288 was for teachers' salaries. Forty-eight public high schools reported 118 teachers, 2786 secondary students, and 1040 elementary pupils; and 24 private secondary schools, a total of 75 teachers and 2766 students and pupils. One public normal school reported 7 teachers and 190 students, and 6 private ones, 36 teachers and 405 normal students. Normal training was also given in 3 colleges and 15 public high schools. Eight colleges for men and for both sexes had together 8 scholarships, 108 professors and instructors, 1636 students, 22,700 volumes in the libraries, \$33,500 invested in scientific apparatus, \$495,000 in grounds and buildings, and \$150,500 in productive funds, and had \$112,591 in total income. The Central Baptist College (for women) had 11 professors and instructors, 130 students, \$30,000 invested in grounds and buildings, and \$14,000 in total income. In 1899 there were 259 periodicals, of which 21 were dailies, 212 weeklies, and 19 monthlies.

Finances.—The assessed property valuations in 1899 were: Real estate, \$119,980,700; personal property, \$59,191,298; total, \$179,171,998, an increase over the total of 1897 of \$1,745,872, real estate showing an increase of more than \$2,000,000, and personal property a decrease of \$361,575. The recognized bonded debt October 1, 1898, was \$882,000; overdue interest, \$683,580; total debt, \$1,565,580, a decrease from the total of 1896 of \$2,653,172, caused by the surrender of bonds and coupons held by the United States under the terms of the federal debt settlement of 1898. Besides this indebtedness, there was outstanding on the above date State scrip and sinking-fund notes to the amount of \$480,286, all of which was called in for payment August 1, 1899. Of the total bonded debt, individuals held \$67,000 of principal and \$123,975 of interest claims. The United States still holds \$160,000 in bonds, one-half of which is to be paid off on or before September 1, 1900, and the other half by September 1, 1901. The unrecognized debt aggregated \$8,706,773, of which \$1,200,000 was due January 1, 1899, \$6,156,773 on January 1, 1900, and \$1,350,000 on April 1, 1900.

Railways.—During 1808 Arkansas was exceeded only by Minnesota in the amount of new railroad construction, the aggregate being 224.28 miles, and in 1899 the construction was 269.48 miles, making the total mileage of the State 3092.77. At the session of the legislature in 1899 a commission was created to regulate railroad and express companies, with authority to fix rates. The penalty for the failure of a company to submit to an order of the commission is from \$100 to \$1000 fine for each day of dereliction, and it is not to be suspended pending an appeal to the Supreme Court.

Insurance.—In the early part of 1899 there were 63 fire insurance companies with headquarters elsewhere that were doing business in the State. The anti-trust law of the legislature of 1899, which prohibited companies from doing business in the State that were members of any association or combination to fix rates on business outside the State, caused the withdrawal of all these companies and left only two mutual companies, holding State charters, at work. On May 27, however, the Arkansas Supreme Court handed down a decision declaring the new law invalid.

Mining Troubles.—Early in the year union coal miners in Sebastian County went on a strike, and the operating companies undertook to supply their places with imported help. Judge Rowe, of the State Court, issued an injunction against such importations, and Governor Jones directed the State authorities to enforce the injunction. A reign of terror existed in the mining region throughout the summer; hundreds of men were imported by the mining companies from Kentucky, West Virginia, and Alabama, and both the union miners and the imported help were armed for a threatened riot. On September 9, Judge Rogers, of the United States Court, delivered an opinion to the effect that the United States Court had jurisdiction over the action of the State Court in issuing an injunction restraining coal companies from importing miners and railroad companies from transporting such miners from another State into Arkansas, and that no State has a right to prohibit the incoming of people from other States not within the classes usually prohibited by State constitutions. The injunction of the State Court was dissolved. The total output of coal in the calendar year 1898 was 1,205,479 short tons, valued at \$1,238,778, an increase of 856,190 tons in a year. Seventeen mines were worked.

Population.—As estimated by federal officials on June 30, 1899, the population was about 1,435,000.

Legislation, etc.—In 1900 the people are to vote upon an amendment authorizing surety companies to be taken on official bonds. Among the legislative measures of the year the following may be mentioned: Physicians and trained nurses cannot be compelled to testify as to information acquired from a patient. Cigarettes must not be sold or given to any one under twenty-one years of age, nor tobacco to a minor under fifteen. Employees of mills and factories must be paid in currency, and advance payments must not be discounted more than ten per cent. per annum. Coal must be weighed before screening as the basis for miners' pay. A railroad commission was established with power to fix rates and maintain control and supervision over railroads. Physiology and hygiene must be taught in the schools with special reference to the effect of alcohol upon the human system. Marriage following seduction does not terminate prosecution, and the wife may be a witness against her husband. Trusts, pools, combinations, and confederations to regulate or fix the price of any article of manufacture, merchandise, commodity, etc., or to maintain such prices were prohibited, and corporations, partnerships, or individuals entering therein are declared guilty of conspiracy to defraud, and shall forfeit from \$200 to \$500 for each day's offence, with forfeiture of charter if a corporation; and every corporation is required to file each year an affidavit of some principal officer that it has not entered into such combination. An act authorized the letting out of paupers to the lowest bidders who give bonds that they will provide them with shelter, clothing, food, and medical attendance. Among the other legislative measures of the year may be mentioned: An act declaring that a husband is not liable for his wife's ante-nuptial debts except by virtue of written contract; an act requiring a foreign corporation to file its charter with secretary of state, and designate agent on whom process may be served; a provision for the funding of the State debt at 3 per cent. interest for 30 years; the admission of claims against the State for taxes erroneously collected if presented two years after discovery of error; declaring taxpayers on unimproved lands in possession when they have paid taxes for seven years; and acts making it a misdemeanor to procure liquor for another in prohibited districts, and requiring judicial officers on information or their own knowledge and belief to issue warrants to search for and destroy liquors in such districts.

State Officers and National Representatives.—Governor, Daniel W. Jones; secretary of state, Alex. C. Hull; treasurer, Thomas E. Little; auditor, Clay Sloan; attorney-general, Jefferson Davis; superintendent of education, J. J. Doyno; commissioner of agriculture, Frank Hill; land commissioner, J. W. Colquitt; supreme court chief justice, Henry G. Bunn; associate justices, Simon P. Hughes, C. D. Wood, Burrill B. Battle, James E. Riddick; clerk, P. D. English. The State legislature comprises 130 Democrats and 2 Republicans. Senators: James K. Jones, from Washington, and James H. Berry, from Bentonville—both Democrats. Representatives: P. D. McCulloch, Jr., from Marianna; John S. Little, from Greenwood; Thomas C. McRae, from Prescott; Wm. L. Terry, from Little Rock; Hugh A. Dinsmore, from Fayetteville; S. Brundidge, Jr., from Searcy—all Democrats.

ARMENIA, a portion of the Turkish empire in Asia Minor, comprising the three vilayets of Erzerum, Diabekr, and Mamouret ul Aziz and the two districts of Van and Bitlis, with an area of 72,491 square miles and an estimated population of 2,472,400; but the estimates of area and population vary, and some figures give the former as much as 90,000 square miles and the latter as much as 5,000,000. In recent years, owing to the disturbed condition of the country, and especially to the massacres by the Turks, a large part of the population has emigrated. In 1899 there was great destitution in the country, and it was reported that many thousands were

dependent upon charity and that the country was threatened with famine. See **TURKEY**.

ARMIES. See articles on the separate countries.

ARMSTRONG, Sir ALEXANDER, K.C.B., LL.D., died July 6, 1899, at the age of eighty-one years. He was born in Ireland and was educated at Trinity College, Dublin, and at the University of Edinburgh. He entered the medical department of the British navy, where he served for many years and in various parts of the world. For five continuous years he was with the party that searched for Sir John Franklin in the Arctic regions; and with this party he discovered the Northwest Passage, circumnavigating the American continent. He served in the Russian war of 1855; from 1869 to 1880 he was director-general of the medical department of the navy. Sir Alexander was a fellow of the Royal Society, and in 1871 was created a military K. C. B. He published *A Personal Narrative of the Discovery of the Northwest Passage* (1857) and *Observations on Naval Hygiene*.

ARMY. See **NURSES, TRAINED**; **SMALLPOX**; **VITAL STATISTICS**.

ARMY OF SANTIAGO DE CUBA, SOCIETY OF THE, organized 1898 to preserve the history of the Santiago campaign of the Spanish-American war. President, Major-General W. R. Shafter; secretary, Major A. C. Sharpe, Washington, D. C.

ARTISTS, SOCIETY OF AMERICAN, founded in 1877, in 1899 had 107 members, holds annual exhibitions at its building, 215 West Fifty-seventh Street, New York City. President, John La Farge; secretary, Douglas Volk. In the exhibition of 1899 the Webb prize was awarded to W. L. Lathrop, and the Shaw Fund to Douglas Volk.

ARTS CLUB, NATIONAL, was organized in 1898, for the purpose of showing the art-loving public what has already been accomplished by Americans in the way of decorative arts. Its membership in 1899 numbered 1100. It holds frequent exhibitions. President, George B. Post; secretary, Charles de Kay, 37 West Thirty-fourth Street, New York City.

ART STUDENTS' LEAGUE, formed in 1875, to conduct classes of instruction in painting, drawing, modelling, and composition, had in 1899 a membership of 364 and 960 students. Advisory director, John La Farge; corresponding secretary, Miss Alice M. Simpson, 215 West Fifty-seventh street, New York City.

ASBESTOS. The production for 1898 amounted to 605 short tons, valued at \$10,300. Canada still remains the chief source of supply. The domestic product, which is true asbestos, comes mostly from Georgia, but the Canadian asbestos, which is chrysolite, a fibrous variety of serpentine, is considered to be of superior quality.

The Canadian production for 1898 was 23,785 short tons, valued at \$486,227.

ASCENSION is a small island of volcanic origin, with an area of 35 square miles, and lies in the Atlantic Ocean, about 900 miles west of the mouth of the Congo in Africa, or about midway between the continents of Africa and South America. It is an important naval station of Great Britain and possesses a steam factory, naval and victualling yards, and a coaling depot. The island has recently been strongly fortified, and is under the British Board of Admiralty, by whom a naval officer is appointed as captain in charge, the present officer being Captain G. N. A. Pollard, R.N. The garrison station is Georgetown on the northeast coast.

ASCROFT, ROBERT, member of Parliament, was born in 1847; died June 19, 1899. He was educated at the Royal Grammar School, Lancaster, England, and in 1869 was admitted to the bar. He was an active participant in the discussion of various questions of capital and labor and settled many business causes in Lancaster. He became president of the Oldham Law Association, and from 1895 to the time of his death represented Oldham in Parliament, as a Liberal.

ASHANTI. See **GOLD COAST**.

ASIA. The purpose of the present article is to give a brief sketch of some of the striking features of the opening up of Asia to Europeans, and to show how far the partition of Asiatic territory among western nations has been carried. Details in regard to the different countries, especially as to their condition and their history in 1899, will be more appropriately treated in the articles on the countries themselves.

Partition of Asia.—The following table gives the estimates of the area and population of the Asiatic territories of the chief European sharers:

		Area in Sq. Miles.	Population.
Russia in Asia.	Northern Caucasia	89,497 (1897)	3,786,784
	Trans-Caucasia	91,346 "	5,461,911
	Caucasus	180,843 "	9,248,695
	The Steppes	908,073 "	3,451,385
	Turkistan	257,184 "	3,898,106
	Trans-Caspian	214,287 "	372,193
	Western Siberia	870,818 "	3,367,576
	Eastern Siberia	3,044,512 "	1,992,221
	Amur Region	880,830 "	339,127

	Indian Archipelago	7,458 "	300,000
	China (Macao, etc.)	4 (1886)	78,627

Russia in Asia.—The greater part of the Russian dominions in Asia has been acquired as the result of a gradual and hardly conscious expansion extending over several centuries. The Russians are fond of saying that Russia is at home in Asia, and they point to this fact as accounting for the rapid and complete assimilation of the natives to their rule. The acquisition of Siberia, for instance, came more from the private initiative of the subject than from any conscious policy on the part of the government. Great blocks of territory were thus involuntarily acquired by the czars, and in this movement the enterprise and courage of the Cossacks played a most important part. It is only of late years that eastward expansion has been carried on in accord with definite principles of governmental policy. The controlling motive in the earlier movement, so far as there was a definite motive, was the desire to gain free access to the ocean and to strengthen the southwestern borders of Russia against the nomadic tribes. Opposition was encountered in only two quarters—namely, the extension of the southwestern boundary of Siberia toward Central Asia and the establishment of Russian power on the Amur. Both these objects have been accomplished in the present century. Turkistan in Central Asia has been conquered by Russia, which has brought under its sway the Khanates of Khiva, Bokhara, and Kokan, and, in 1850, Admiral Nevelsky hoisted the Russian flag at the mouth of the Amur. Shortly afterward Russia acquired all the left bank of the Amur, and in 1860 the region of its tributary, the Usuri River. Finally, the whole territory extending from the sea of Okhotsk and from Corea and Manchuria came into Russia's possession, laying the basis of the great power which to-day threatens the northern frontier of China. Russia points to the peaceful character of this expansion as a sign of the humane spirit of the advancing race and of its natural sympathy with and understanding of the subject peoples. The

chief object of this movement during the present century appears to have been the need of an outlet on the open sea. To this end the policy of Russian monarchs, from the time of Ivan the Terrible to the present day, has, from time to time, been directed and it is this which has brought Russia to Port Arthur on the Chinese coast. What seems to other nations a sign of aggression and greed on the part of Russia is justified by her writers by the argument of manifest destiny and by an appeal to the natural justice of Russia's claim to be the civilizing agent for the less advanced populations of the east. They disclaim all intention of partitioning Asia, but they evidently believe that sheer force of circumstances will carry Russia's dominions in Asia farther as time goes on. In point of mineral wealth and other natural resources Russia's Asiatic possessions surpass those of any other European power. Siberia has already advanced to an extraordinary degree in trade and industry and further developments are certain. The Russian prestige among the native population is greater than that of other European powers, and it is attributed by Russian writers not to mere conquest and brute force, but to the natural sympathy between them and the natives. Russia's influence in Central Asia is increasing as well as on the eastern coast. It is paramount at the Persian capital, and northern Persia seems destined to be hers. On the Afghan frontier she has been active for many years, and in the Pamir Mountains, known as the roof of the world, where three great powers meet, she was threatening some years ago to assert her authority. She sent down a military expedition in 1891, and by establishing a permanent military post made them her territory. To the south of the Pamirs lie the range of the Hindu-Kush, dividing the Indian waters from those which flow into Central Asia. Beyond this the British government has declared that there shall be no interference on the part of a foreign power. In 1891 the British, on learning that Russian officers had crossed to the southern side of the range, occupied Hunza and Chitral. Later the limits of their respective territories were defined. By this arrangement British political control extended to the Hindu-Kush range, and is separated from Russian territory by a narrow piece of Afghan land, which is indirectly under the control of the Indian government, so that the territories of the two powers are almost coterminous. For some account of the recent events bearing on Russia's share in China, see the article CHINESE EMPIRE. See also AFGHANISTAN (paragraph Afghan Question).

British Asia.—Besides the vast dominion of India, British power has expanded eastward over Baluchistan to the Persian frontier and along the coast of the Bay of Bengal, over the Straits Settlements. Toward the west the expansion has extended over eastern Arabia, where the dominance of British influence was asserted in 1899 in connection with the Muscat incident. (See FRANCE.) Toward the north the British have extended their control into the Himalayas and annexed several of the hill states in that region. Southwestern Arabia is also under British influence. Among the other great dependencies are Ceylon and Hong-Kong, which have for years been prosperous colonies. North Borneo, which was won for Great Britain years ago by Rajah Brooke, is also a promising colony. Her trade route to her eastern dominions is by way of the Suez Canal in time of peace; the Cape route would be used in time of war, when the Mediterranean would be unsafe for trade on account of exposure to attack from the surrounding coasts. The Cape route has the convenient coaling stations of Sierra Leone, Cape Town, and Mauritius.

French Asia.—The centre of French influence in China is the rich valley of the Mekong River, along whose course lie the following countries in their order from its source: First, the region of Laos; then Anam, which is an empire under French protection; then Cambodia, a protectorate under the administrative control of France; then Cochin-China, spreading out into a marshy plain of fertile land, and finally Tonquin, which, though nominally a protectorate, is directly under French administration. Of these Anam was the first to enter into permanent relations with France, its ruler having concluded a treaty with the latter power toward the close of the eighteenth century, and having conceded to France the bay of Turan and certain commercial advantages in return for aid rendered him in war. The last to come under French control was Tonquin, which is now one of the most valuable of the French possessions. It was won only by dint of hard fighting and great loss of life in repelling the claims of China, which were finally annulled by the treaty of Tien-tsin in 1885. For years after this the country was still in disorder, and it is only at a recent date that an orderly and effective administration was insured. It is estimated that the commerce of Cochin-China and Cambodia rose from 100,000,000 francs in 1888 to 147,000,000 in 1897, and that the commerce for the whole of French India was 205,000,000 francs in 1897, and reached a still higher figure in 1898. But the expense of administering the government has been very heavy, over 20,000,000 francs being annually paid out for military expenses. Repeated troubles with Siam, whose government was accused by the French of en-

croaching on their dependency of Cambodia, led finally to the threatened bombardment of Bangkok in 1893, and in 1896 a treaty with England established the present relations between France and Siam. This treaty neutralized the basin of the Meinam for France and England. Between Burmah and Tonquin the Mekong marks the dividing line between the French and English possessions. Another neutral strip lies in Siamese territory on the right bank of the Mekong, into which the Siamese government has promised not to send armed troops. Between the Mekong and the basin of the Meinam the territory is subject to French influence, and French agents are kept at the principal towns. See **INDO-CHINA, CHINA**, and the separate articles on the French possessions.

The relations of the United States with Asiatic politics have been almost exclusively concerned with commercial privileges in China and Japan. An account of their most recent aspects will be found in the article on Chinese Empire.

Railways.—Railway development has been a remarkable feature of the recent progress in Asia. In Asia Minor the Germans are actively engaged in railway extension. A German company has obtained a concession for a new line. The French have already opened a railway extension as far east as Afium Kara Hissar. When the German line is completed it will cover some 2000 miles and unite the Persian Gulf with Europe, opening up a rich agricultural country. This will give Germany the control of the chief markets of Asia Minor. The Constantinople-Ismid line, which has been purchased by German capitalists from an English company, has been extended to Angora. The trade of Smyrna and Constantinople, the chief distributing points of Asia Minor, is thus brought under German control. It is estimated that the railways in all Asia have at present a length of about 30,000 miles, two-thirds of which belong to British India. The parts of the Trans-Caspian and Trans-Siberian lines already constructed have a length of about 3200 miles. It is estimated that European syndicates have obtained concessions for 3600 miles of railways in China, and the Chinese government owns about 300 miles. See the article **CHINESE EMPIRE** (paragraph Railways).

Japan (*q. v.*) has an extensive railway system, the length of which is estimated at 3200 miles. French Indo-China, though having only about 120 miles at present, has in prospect some 2400 miles. There are 1000 miles of railway lines in Java. Railway construction has hitherto been unimportant in Persia, but Russia has taken charge of the Persian railway development, and important projects were formed in 1899.

ASIATIC ASSOCIATION, AMERICAN, organized in 1898 for the purpose of fostering commercial relations between the United States and the East, had in 1899 a membership of 205. President, Everett Frazar; secretary, John Foord, P. O. Box 1500, New York City. See **CHINA**.

ASIATIC SOCIETY OF BENGAL founded in 1784 in London, has an Indian Museum, and publishes *Bibliotheca Indica*, a series of volumes of Oriental literature.

ASPHALT. See **PAVEMENTS**.

ASPHALTUM. The production of the different varieties of asphaltum in 1898 was as follows:

Variety.	Quantity.	Value.
Crude asphaltum.....	11,300	189,900
Bituminous sandstone.....	43,624	126,831
Bituminous limestone.....	5,502	26,412
Mastic	1,188	17,840
Hard and refined, or gum.....	1,878	53,666
Maltha	12,875	271,000
Total.....	76,367	685,649

It is interesting to know that bituminous rock makes up 65 per cent. of the tonnage, but less than 35 per cent. of the value. Most of it comes from California. Professor W. S. Day has described a new solid asphalt from Utah, which is known as nigrite, on account of its intensely black color. It resembles asphalt in many of its properties, but differs from it in giving a perfectly black streak, while other asphalts, which are black in lump, give a brown streak. It cannot be entirely melted, and the distillations produced are not easily volatile, although two-thirds of the material is volatilized by heating. The general character of the nigrite leads us to believe that it was formed by distillation—that is, by the passage of steam through a rock. This deprived it of the most volatile constituents, while the subsequent direct heating of the residue converted it into nigrite as found. Much attention is now being paid to the asphaltum deposits of Indian Territory, which, Taff states, occur near McAllister as stringers in veins, filling fissures along lines of faulting. Liquid asphaltum is reported to have been discovered in the vicinity of Higginsville, Mo.,

and massive asphaltum from Montana. The imports of asphaltum during 1898 amounted to \$260,765, and were obtained from the West Indies, Switzerland, Italy, Venezuela, Germany, France, Mexico, Turkey in Asia, Great Britain, United States of Colombia, and Canada.

ASPIROZ, MANUEL, who succeeded Señor Matías Romero as Mexican ambassador to the United States, was born in Pueblo, June 9, 1836. He was graduated from the University of Mexico, studied law and attained distinction. He served in the war against the French, and won promotions and medals, and, after the republican government had been established, he became assistant secretary for foreign affairs (1867). In 1872 he came to Washington as agent for his government before the Mixed Claims Commission. In 1873 he became Mexican consul at San Francisco. Subsequently he served in the national senate, and was entrusted with several important matters of diplomacy. From 1883 to 1890 he was professor of Mexican law in the State College of Pueblo, and also acted as secretary of the treasury of that state. In May, 1890, he again became assistant secretary for foreign affairs, and on several occasions the department was under his charge. In his own country Señor Aspiroz is recognized as a man of learning and ability. In 1876 he published *Código de Extranjería de los Estados Unidos Mexicanos*.

ASSEMBLY, GENERAL, The officers of the General Assembly of the Presbyterian Church (North) are: Moderator, Rev. Robert F. Sample, D.D., New York City; stated clerk, W. H. Roberts, D.D., LL.D., 1319 Walnut Street, Philadelphia, Penn.; president of trustees, George Junkin, Esq., Philadelphia; treasurer, F. K. Hipple, Esq., Philadelphia; corresponding secretary, Edward B. Hodge, D.D., 1319 Walnut Street, Philadelphia, Penn.

The officers of the Presbyterian Church (South) are: Moderator, J. F. Cannon, D.D., St. Louis, Mo.; stated clerk, W. A. Alexander, D.D., Clarksville, Tenn.; permanent clerk, Robert P. Farris, D.D., St. Louis, Mo.; president of trustees, E. Nye Hutchinson, Charlotte, N. C.; secretary and treasurer, John R. Farr, Esq., Charlotte, N. C.

ASSOCIATE REFORMED SYNOD OF THE SOUTH (Presbyterian) had in 1899, 9 presbyteries, 104 ministers, 130 congregations, and 10,364 communicants. A great loss was sustained in 1899 in the death of the Rev. Dr. W. M. Grier, president of Erskine College.

ASTERIODS. See ASTRONOMICAL PROGRESS.

ASTEROL. A new antiseptic, a soluble preparation of sulfocarbolate of mercury, has been devised. It contains 17 per cent. of mercury, thus being about one-quarter as strong as bichloride of mercury. Asterol is soluble in water, forming a permanently clear solution; it is markedly bactericidal, and it is not precipitated by albumen; it is not cauterant, though deeply penetrating, and it does not attack instruments.

ASTRONOMICAL AND ASTROPHYSICAL SOCIETY. See ASTRONOMICAL PROGRESS.

ASTRONOMICAL PROGRESS DURING THE YEAR 1899.—The year 1899 was fully up to the average in the number and importance of new discoveries and researches. Those of special interest are described briefly in the following pages, omitting technicalities as far as possible.

Ancient Astronomical and Meteorological Documents.—Professor Hellman, of Berlin, has prepared a volume of reproductions from certain rare meteorological and astronomical documents dating from the fifteenth and sixteenth centuries. Bearing upon astronomy principally from the historical side, these documents are of special interest as showing how very old are many of the signs and superstitions still surviving in our common almanacs of the present day. There are in all twenty-three reproductions in fac-simile of old publications, dealing principally with weather predictions and with accounts of remarkable observed phenomena. Sixteen of these are of German origin, three French, three Italian, one Spanish, one English, one Dutch, and one Danish.

The English document is entitled *An Almanacke and Prognostication made for the yeare of Our Lorde God M.C.LV* made by Maister Anthony Askham Phisician and Preste. Here we are told that medical remedies, "preparatiues for digestion," will be most effective if taken when the moon is in certain signs of the zodiac. This survives in the almanacs of to-day. Thus the *Farmer's Almanac* of New England still gives for each day of the year the name of the zodiacal sign in which the moon happens to stand. This information is for no other purpose than to aid in medical treatment. Medicine to cure the headache, for instance, must be used when the moon is in Aries, etc., etc. We have seen very recent almanacs in which a definite statement to this effect was duly printed in modern type and language. The old English almanac under discussion also says that when the moon

is in "Aquarius or Pysces" we may "cut heyres." Weather predictions are given in precisely the same ridiculous form as we still find in some of our modern almanacs. "Many hayle showers and cold a day or ii," says this old almanac of 1655, in nearly the same language as that used to-day. There are still many persons who cannot be persuaded that changes in the weather do not follow as a necessary consequence of changes in the moon's quarters, notwithstanding the fact that the lunar phase changes every day in the year just as much as it does at the quarters and at new and full moon. Doubtless the genuine astronomical predictions of our almanacs, such as eclipses of the sun and moon, dates of full and new moon, times of sunrise, etc., lend an air of reliability to the hodge-podge of unnecessary or incorrect meteorological material.

Theory of Ocean Tides.—Tidal theory offers one of the most intricate problems known to mathematical science. It has received the attention of many of the best mathematicians, and cannot be said even yet to have been solved in a thoroughly satisfactory manner. And aside from the purely theoretical treatment, it is not too much to say that we possessed no good non-mathematical presentation of the theory in a form easily understood until the recent appearance of Darwin's book on the subject (*The Tides*, by George Howard Darwin). Himself a distinguished contributor to the mathematical literature of the tides, Darwin has approached the task of explaining them in popular language, equipped with a more intimate knowledge than that possessed by any other writer. And notwithstanding the intricate nature of the whole matter, he has really succeeded at last in giving us a simple explanation easily understood by any one. The importance of such a presentation cannot be overestimated; it is indeed no mean contribution to pure theory itself.

The reader will recall the usual explanation of the text-books on astronomy. Tides are caused by the gravitational attraction or pull of the sun and moon upon the water, and upon the earth itself. The moon being so much nearer than the sun, is of course, the principal cause. When the moon is directly over a given place it pulls the water under it, and thus tends to heap up a tidal wave just under the moon. At the same time it is pulling the earth itself; but it pulls the water more than the earth underneath, simply because the moon is nearer to water on the surface than it is to the solid earth behind it. For we must remember that, according to Newton's law of attraction, the pull decreases rapidly when the body pulled is removed to a greater distance. But this reason also makes the attraction exerted upon the solid earth greater than that affecting the mass of water upon the side of the earth opposite to the moon. This water being still farther away than is the solid earth, gets the least pull of all. The earth is, so to speak, pulled away from that part of the ocean that is opposite the moon, instead of directly under it. This causes another distinct heaping up of water opposite the moon, giving us a second tidal wave. There should be, therefore, two lunar tidal wave crests, one directly under the moon, and the other on the side of the earth opposite the moon. This explanation is modified somewhat on account of the attraction of the sun, which at times tends to increase, and again at times to diminish, the lunar tide. We thus get the high tides of full moon and the low tides of certain other ages of the moon. And the double tidal wave explains why there are two high tides and two low tides every twenty-four hours. This explanation is called the "equilibrium" theory of the tides. It is very plausible, but unfortunately it fails to agree with observed facts, though it is nevertheless of great use in leading up to a better theory. Under the equilibrium theory we should expect high water at any place about the time when the moon, as astronomers say, passes the meridian. This time might be modified by the solar effects, but only to a rather small amount easily calculated. Unfortunately, this is not in accord with observation. There are places where the high water comes as much as six hours away from the meridian passage of the moon. In other words, the equilibrium theory is at times in error by the maximum possible amount. The trouble is that it tells us what would happen if the forces governing the tides had plenty of time to act. But the turning of the earth on its axis continually presents a new meridian to the moon, so that the tidal wave crest is always following the moon, ever trying to be highest directly under it. Thus what should occur under the equilibrium theory is greatly modified by the theory of the motion of fluid waves. This leads them to the "dynamical" theory of the tides, which Darwin presents with really remarkable lucidity.

A consideration of the subject is much simplified by assuming a condition of things that does not really exist in nature. Let us imagine a canal full of water encircling the earth at the equator. Sir Isaac Newton was the first to investigate what would happen to a wave set in motion in such a canal. It can be shown mathematically that the speed at which such a wave would travel depends simply on the depth of the canal. The deeper the canal, the greater the speed of the wave. This is, of course, very important, and shows what a perfectly free wave would do under such simplified conditions. It can even be computed that if the canal

were $13\frac{3}{4}$ miles deep, the wave would travel round the earth in exactly twenty-four hours. Now, it is the tendency of the sun and moon to set such a free wave in motion at each instant of time; and these go on travelling along more or less like the supposed simple wave in the canal. If the ocean were $13\frac{3}{4}$ miles deep, the waves would have a period of one day; and the new free waves forming all the time would reinforce the old ones, leading to an enormous tidal accumulation. Fortunately, the ocean is much less than $13\frac{3}{4}$ miles deep, and the waves travel much more slowly than once a day. It may happen, therefore, that as the waves travel around the earth, their speed may be such that we shall find a wave hollow instead of a wave crest under the moon. Thus the modification of the equilibrium theory by the wave motion may at times completely reverse things, giving us low tide when we should expect high tide.

We may carry the canal idea a step farther, with a remarkably interesting result. Suppose the whole surface of the earth were covered with a series of canals parallel to the equatorial canal. Then, as we approach the pole, the canals will be shorter, since the equatorial circumference of the earth is longer than it is in any other latitude. Thus the waves in high latitudes would not have so far to go as the waves in low latitudes, and so might tend to reinforce each other as explained above. So we might have "inverted" tides in the equatorial regions and direct ones in the polar regions; and in some intermediate latitude there would be, as Darwin says, "very great tides, the nature of which cannot be specified exactly." This would occur, as we have seen, where the earth's circumference is short enough to permit a free wave to go all around in about twenty-four hours. These dynamical considerations of wave motion in canals lead to results bearing some sort of resemblance to the actual observed phenomena of nature. But interesting as it is, we cannot here pursue the subject farther from a theoretical standpoint.

Fortunately, the practical prediction of the time of high water for any place can be effected with quite high precision, and almost without using any theoretical considerations whatever. It is merely necessary to analyze by certain known methods a very long series of tidal observations made at the place in question, in order to arrive at a more or less empirical law by means of which future high tides can be predicted for that place. This method of procedure has been in use for many years, and we now possess tidal tables for all principal seaports quite accurate enough for the purposes of navigation.

In addition to his lucid and novel treatment of the subject of ocean tides, Darwin has also dealt with a number of interesting phenomena hardly, if at all, treated by other investigators. The subject of "cosmic" tides is well explained. These cosmic tides are the immense tidal effects that we must imagine were set up in the planetary systems while still in a semi-plastic condition during the process of evolution. Such a system is that formed by our earth and moon. It would lead us too far afield to do more than touch very briefly indeed upon these matters. But Darwin has shown that the moon probably once was a part of the earth, and that cosmic tidal effects might readily account for its being detached in some very early and plastic stage of the earth's development. Terrestrial variation of latitudes, Saturn's rings, and numerous other phenomena coming more or less closely within the range of tidal theory, also find a place among Darwin's profound researches.

The November Meteors.—The meteor shower which was expected for November of this year received much attention both from astronomers and from the public at large. The newspapers in particular exploited it extensively, and in a manner more or less sensational. It seems as though their object was to awaken great popular enthusiasm and create a demand for meteor news which they would then, of course, be ready to supply. So there was a sort of retributive justice in the fact that the meteors were not actually observed to any great extent, and the newspaper hubbub ended with extreme suddenness. We doubt whether any reputable astronomer placed himself on record as predicting with certainty the arrival of this meteor group. And while we cannot too often emphasize that mathematical calculations do not lie, provided only they are the work of careful and competent authorities, we find the public insisting upon giving full credence to the statements of careless and incompetent persons. But since there has been so much meteor discussion of late, a very brief statement concerning the November shower may be of interest. In the first place, the meteors themselves are simply mineral fragments, probably usually quite minute, and travelling through space in orbits not unlike planets or comets. They are not themselves luminous, and we see them only when they happen to dash into our terrestrial atmosphere. Friction of the meteors against the air then heats them, until they become first red-hot, and then incandescent or luminous, like any other burning substance. When the heat is finally sufficient to transform part of the melted meteoric mass into hot, luminous vapor, this will stream out behind the flying particle itself, giving us the characteristic meteor trail. This trail (popularly called a shooting star) is a startling object in the stillness

of the night. It is easy to understand that if the number of these trails should be very great, running up perhaps into the hundreds every minute, we would have one of the most impressive and beautiful sights in all nature. Now, this is precisely what happened in 1799, 1833, and 1866; so there was certainly some excuse for the extraordinary newspaper interest in the expected shower of 1899.

This particular great bunch of meteoric particles, called the Leonids, is moving around the sun in an elliptic orbit, completing an entire circuit once in about thirty-three years. The orbit or path intersects that of the earth, and it is possible for the meteors and the earth to occupy occasionally the same point in space. But we can see the meteors only if they come near enough to penetrate actually into our own atmosphere. Therefore, they cannot become visible unless meteors and earth are at that particular intersection of the two paths at one and the same time. If either is early or late at the meeting-place, we cannot see the swarm. This, apparently, is just what has happened this year, and so only a few stragglers or forerunners of the main body of meteors were actually seen. The question is therefore now often asked: "How did the astronomers come to make such a mistake?" The answer is, that there was no mistake. It is not within the power of science to accomplish the impossible. Astronomical calculations concerning meteors cannot be predictions of definite certainty. The most we can do is to state the likeliest time for the phenomenon to become visible, always adding that this time may be in error by a considerable amount, and that quite possibly a visible meeting of earth and meteors will not take place at all. Our predictions result from calculations based ultimately upon previously observed data; and there is much difficulty in observing meteors exactly. Each individual meteor is visible for so short a time that it is quite impossible for the observer to record its position with great accuracy. Here again, as in so many departments of observational astronomy, we have much to expect from photographic processes of observation. For the meteors, when they become luminous, quite readily impress the sensitive surface of a photographic plate, and thus leave a permanent record admitting of subsequent leisurely and accurate measurement. But unfortunately, there has been no great shower of Leonids since the introduction of photographic methods. In 1866, when they last appeared, astronomers were just beginning to use the camera, and no arrangements for photographic work were made. This is the reason for the elaborate preparations to photograph the expected shower of 1899. Astronomers were by no means sure that the event would occur at the predicted time, but they were quite certain that no precautions should be neglected which might bring about successful observations in case the shower should occur and the weather prove favorable. To guard against the chance of bad weather, numerous photographic observing stations were established so as to cover a wide extent of territory; and to prevent failure arising in case the shower should happen during daylight, a well-equipped expedition was despatched to India, where, of course, it would be night during the hours of daylight in America.

A New Satellite of Saturn.—It begins to seem as though there were no limit to the range of astronomical possibilities opened up by the application of photographic processes of observation. Certainly we must characterize as one of the most brilliant discoveries of the year, W. H. Pickering's remarkable photographic observations, which have added a new member to the group of satellites circling the ringed planet Saturn. It will be remembered that the Harvard College Observatory was enabled to construct a new and large photographic telescope a few years ago. The cost of this instrument was defrayed at the time by Miss Bruce, of New York City, and it has since been known as the Bruce telescope. It was finally mounted at the branch observatory maintained by Harvard at Arequipa, in South America. Here numerous photographs of the region surrounding Saturn have been made from time to time by Dr. Stewart. A careful examination of these by W. H. Pickering revealed the new member of the solar system. The discovery was announced by E. C. Pickering, director of the Harvard College Observatory, in a printed circular dated April 10, 1899.

The manner in which the discovery was made by Pickering is very interesting. He superimposed two negatives made August 16 and 18, 1898. Of course, all the star-images on the two photographs corresponded exactly. Every star-image on the one plate was covered by a star-image on the other. But it was very different with the satellite. For in the interval of two days between the dates of the photographs, this small body had moved a little in the course of its orbital revolution about the planet Saturn. Consequently, as Pickering says, "a faint object was found which appeared in different positions on the two plates." This established beyond a doubt that we have to deal with something other than a star. It must, therefore, be either an asteroid, a satellite of Saturn, or some unknown planet exterior to Saturn. The possibility of its being an asteroid is negated at once; for the photographs show its rate of motion among the stars to be less than that of Saturn, so that it is cer-

tainly farther away from the sun. For the nearer a planet is to the sun, the more rapid is its apparent motion. So it cannot belong to the group of asteroids which are all within the orbit of Jupiter, and very far within that of Saturn. There remains the hypothesis of a possible exterior planet. From the evidence at present in hand, we cannot yet decide with absolute certainty the true nature of the new body. But we can at least say that the close proximity of Saturn renders it extremely probable that we have to do with a satellite. That a new exterior planet should be found so near to Saturn on the sky is, indeed, possible, but improbable in a very high degree. This question will, of course, be set definitely at rest as soon as we can dispose of some further photographic observations. Visually, the new object has not yet been discovered. Assuming, then, that we have to do with a true satellite of Saturn, we can summarize very briefly the information so far obtained. The plates at our disposition are four in number—two made August 16, and one each August 17 and 18, 1898. Thus, while there are four plates, there are but three dates of observation, and these separated by an interval of one day only. This is but meagre material upon which to found a study of the satellite's orbit. But there can be no doubt that ample observations will soon be available, for a number of additional photographs have been made with the Bruce telescope, and will soon be fully measured and discussed. So much we know, however. The new satellite is so far from Saturn that the attraction of the latter upon it can be but little greater than that of the sun. The orbit will doubtless turn out to be a very elongated ellipse. It is interesting to note that the last discovery of a satellite of Saturn was also made at the Harvard College Observatory. It occurred in September, 1848, when William C. Bond discovered Hyperion. The new satellite has received the name Phœbe.

Woman's Work in Astronomy.—Miss Dorothea Klumpke, of the observatory in Paris, France, has published (*Bull. de la Société Astronomique de France*, April, 1899) a very complete article on the contributions of women to astronomical science. The subject is interesting at the present time, when women are beginning to enter more and more into professions and pursuits formerly considered open to men only. The historical part of Miss Klumpke's investigation outlines briefly the work done by the well-known scientific women of ancient and modern times. The efforts of Caroline Herschel, Mary Somerville, and Sonya Kovalevski have certainly been rewarded by no small measure of success, and, in earlier times, such women as Hypatia and Maria Agnesi have placed their names upon the roll of distinguished mathematicians and astronomers. Yet it has been questioned with some show of reason whether these women were not famous rather because they were scientific women than because they produced really original and valuable contributions to exact science. That a woman should devote herself to very abstruse studies is so uncommon that it attracts attention for that reason alone. However that may be, Miss Klumpke has certainly established one important point. The modern development of photographic astronomy has really opened a genuine new profession to woman. The older forms of observational astronomy offered her but rarely an opportunity for a successful career. The necessity for prolonged observation at night and the consequent exposure to the rigors of winter weather have been among the difficulties in the way. But the photographic method in astronomy has changed all the conditions of observing. Measurement of photographic plates with the microscope has replaced direct telescopic scrutiny of the sky. Daylight observation has been substituted for night work. A comfortable chair in a well-warmed and lighted astronomical laboratory is now used, while formerly the observer sat in a constrained position upon an observing chair more or less closely resembling a ladder. Moreover, photographic measurement requires painstaking care, neatness, and industry, rather than originality of mind and physical endurance. It is therefore particularly adapted for women, and they have not been slow to take it up. As Miss Klumpke points out, quite a large number of important observatories now have laboratories for the measurement of celestial photographs, and in most of these the work is done by women. Among the number are Paris, Greenwich, Oxford, St. Petersburg, Helsingfors, Cambridge, U. S., New York, Cape Town (South Africa), and many others. Probably more than a hundred women are now working as professional astronomers in this way. There can be no doubt that the number will go on increasing steadily, so that we have really not gone too far in saying that photographic astronomy has given a new profession to woman.

A New Fundamental Catalogue of Stars.—One of the most important uses of astronomy for the practical purposes of every-day life arises in connection with the navigation of ships across the ocean. Every one knows nowadays that navigators find their way by means of sextant observations of the sun or stars. Probably fewer persons, however, are aware that such observations do not furnish the position of the ship directly, but that they must first be subjected to a process of calculation or reduction in order to obtain the ship's latitude and longitude. In

making these calculations, the navigator requires certain astronomical data which vary from day to day throughout the year, and which are not even the same for the same date in different years. These data can be computed in advance by astronomers and tabulated for navigator's use. Such a tabulation of astronomical data is called a "Nautical Almanac." The preparation and printing of such almanacs is very costly, yet it is a work of public necessity, and is therefore properly carried out at national expense. The governments of England, France, Germany, and the United States each maintain an office for the preparation of nautical almanacs, and for their publication two or three years in advance of the time when they will be needed by navigators.

In the computations made in this way at the nautical almanac offices, certain fundamental astronomical tables and constant quantities have to be used. Such are, for instance, tables of the planetary motions about the sun in accordance with the Newtonian law of gravitation. Among the astronomical constants we may mention the distance from the earth to the sun, or "solar parallax," the velocity of the propagation of light through space, etc. Among all this fundamental material of computation, one of the most important and prominent necessities is a catalogue giving the exact positions on the sky of the principal fixed stars. Of course, the greatest efforts are continually being made to improve the exactness of the data used in preparing the nautical almanacs, so as to make the latter also come as near as possible to perfect precision.

In the early part of the year 1896 the directors of the four national almanacs mentioned above met in Paris to confer upon the best methods to be pursued in order to reach the desired results in the most expeditious and economical way. It is not too much to say that this Paris conference of 1896 marks a distinct epoch in the progress of astronomy. For the nautical almanacs are not intended solely for the comparatively rough purposes of the navigator. They contain also certain materials that are used in the reduction or computation of all astronomical observations of precision, and thus exercise an influence of no small import upon the progress of the science as a whole. This conference was attended by Newcomb and Backlund, representing the United States; Bauschinger, representing Germany; Downing and Gill, representing Great Britain; Faye, Loewy, and Tisserand, representing France. Each country was thus represented by the director of its nautical almanac, and in some cases by one or two other specialists. The principal results of the conference may be summarized as follows:

1. An agreement was reached as to the values to be employed in all the almanac computations for the fundamental astronomical constant quantities.
2. It was arranged to avoid unnecessary duplication of computations by interchanging certain calculations between the several offices.
3. The preparation of a new standard star catalogue was decided upon, to serve as a basis of work for all the almanacs.

The first of these three resolutions is perhaps the most important of all. We cannot too often emphasize the fact that all astronomical knowledge, based as it is ultimately upon the fallible human senses of observation, can never be perfectly exact. We approach as near as we can to the truth, but never quite reach it. Now, under the force of this first resolution, whatever may be the small and unknown errors of our fundamental astronomical data of computation, their effects will henceforth be uniform in all the almanacs. Thus, so far as these almanacs are made the basis for the calculation of all other astronomical observations, the results will be affected with just the same errors. Uniformity in the observations of different countries will replace the present state of comparative confusion. Then, in the future, whenever science shall advance our knowledge of the fundamental data a step nearer the goal of perfect truth, all series of observations will be found to require just the same corrections. The application of these corrections will then become a very simple matter. There can be no doubt but that astronomers of coming generations will have abundant reason to be grateful to the conference of 1896.

The second resolution of the conference is obviously desirable on the score of economy. We pass at once, therefore, to the third resolution, relating to the star catalogue. We shall not enter into technical details, but simply say that the delicate task of preparing such a catalogue as is needed was entrusted to Newcomb, of Washington, by unanimous vote of his colleagues at the conference. The resulting catalogue has just been published (*Catalogue of Fundamental Stars for 1875 and 1900, Reduced to an Absolute System*, by Simon Newcomb. *Astronomical Papers Prepared for the Use of the American Ephemeris and Nautical Almanac*, Vol. VIII., Part II.). The magnitude of this undertaking will be well understood when we remember that it involves the discussion and combination of all existing star observations made since the time of Bradley, about the middle of the eighteenth century. That the task would be skilfully and effectively accomplished by Newcomb was so certain in advance, that it seems almost superfluous to say that the

publication of his catalogue is to be counted among the specially important advances of astronomy during the year 1899.

The Astrophotographic Star Catalogue.—This great undertaking involves the co-operation of no less than eighteen observatories and aims at the cataloguing of some two million stars. Star catalogues may be said to be of two kinds: Those which aim at extreme precision, and those attempting completeness as to the number of stars entered in the list. In the former, the great labor involved for each star makes it essential to limit strictly the number of stars. If this were not done, it would be difficult to bring the work within the possibilities of human effort. On the other hand, we may diminish a little the rigid precision with which we obtain and discuss the observational material for each star, and in that case we can attempt greater completeness as to numbers. It is just here that the photographic method is most promising; for it will enable us to be certain of getting into our catalogue every star within the desired limits of magnitude, yet the diminution of precision will not be much, considering the comparatively small quantity of labor involved in the use of photographic methods.

As an example of the extreme "catalogue of precision" we may take Newcomb's work, prepared for the use of the nautical almanac offices, and described in another part of the present article. This kind of catalogue might be likened to a biographical dictionary, in which only important names find a place, but in which all discoverable information is given for each entry. The other kind of catalogue is more like a city directory, which aims at including the name of every resident, but furnishes very little further information.

While we have mentioned that two million stars may be expected to find a place in the photographic catalogue, this must, of course, be taken as a rough advance estimate. The real number will not become known until the final measurement of all plates shall have been completed under the microscope. Yet it is of the greatest interest from several points of view to know just how many stars there are of the several degrees of lucidity. Thus, for instance, a knowledge of the relative number of stars of each magnitude would throw much light upon certain theories as to the distribution of matter in the universe. We therefore welcome as very interesting some definitive figures published by the observatory of Greenwich, England. They have there measured completely all the plates between the declinations 64° and 70° of the northern hemisphere, so that information as to this quite wide zone is now available. The total number of stars measured within these two limits is 58,170. The corresponding number in the great co-operative star catalogue, which has been in process of publication by the *Astronomische Gesellschaft* during the last thirty years is only 4966. Yet this latter is the only catalogue of any accuracy which even approximates in numbers to the photographic work, and the star-positions obtained from the photographs are doubtless more accurate than those of the *Astronomische Gesellschaft* catalogue. Even the Bonn "Durchmusterung," which is a mere inventory of the stars, giving only approximate positions without pretensions to close accuracy, has only 9971 stars in the zone under discussion. Thus we may say that the new catalogue, for this part of the Greenwich zone, has twelve times as many stars as the *Astronomische Gesellschaft* catalogue, and six times as many as the Bonn *Durchmusterung*. More eloquent testimony in favor of photographic processes in astronomy it would not be easy to imagine.

At Potsdam, Germany, another of the observatories participating in this work, they have proceeded far enough to publish this year the first instalment of their part of the catalogue. This is, indeed, the first portion to be issued in definitive form, and is therefore especially noteworthy. The Greenwich results mentioned above are derived from a preliminary statistical communication, no portion of the Greenwich part of the catalogue having appeared as yet. The Potsdam volume gives the measures of 57 plates containing 20,627 stars. It merits somewhat detailed attention here, because, as we have said, it is actually the first volume of a stately row of volumes which will some day constitute a catalogue of stars really worthy of the present state of astronomy. The Potsdam astronomers have evidently been limited somewhat by lack of sufficient funds to carry the work to completion in just the form that would have suited them best. It is plain that the first step in dealing with astronomical photographs must consist in measuring upon the plate the exact positions relatively to each other of the many little black dots representing each a lucid star in the sky. This series of measurements furnishes what astronomers call the "rectangular co-ordinates" of the stars on the plates. These are then the fundamental or raw material for further treatment. The original measures so obtained do not represent quite correctly the actual positions of the stars on the sky, for the photographs are distorted somewhat by the effects of the refraction of light in the terrestrial atmosphere. A ray of star-light, when it impinges on our atmosphere, is bent a little out of its straight course. Just so, when we submerge part of a straight stick in a pool of still water, the stick seems to be bent at the water's sur-

face. This is due to a "refraction," or bending of the light coming to us from the stick under water. The bending always takes place when light passes from one medium into another; and passing from the nothingness of outer space into our air is much like passing from air into water. We do not even find that all the stars have their light refracted by just the same amount, for the refraction depends on several elements that differ for different stars on a plate. We pass over, as somewhat too technical, the details of this matter of refraction, and also the effects of aberration of light, and all the other causes which may make the raw measures on the plate differ from the sky above us. Suffice it to say that methods are known to astronomers by means of which these effects can be eliminated by a process of calculation. Thus the original measures can be transformed into what they would have been if there were no such things as refraction, etc. Still further computations then enable the astronomer to obtain from these measures corrected for refraction, etc., the final positions of the stars on the sky, in just the same form as they would have if derived by the older processes of direct observation instead of photography.

As may be imagined readily enough, all these calculations are extremely tedious and lengthy when carried out rigorously and with exact attention to every detail. They can, however, be much abbreviated if we are willing to sacrifice a little of the last degree of precision in the final catalogue results. Now the Potsdam astronomers have been confronted with the absolute necessity of economizing somewhere in their work, and they have decided wisely that such economy as was necessary should be exercised in the processes of calculation rather than in the actual measurement of the negatives. Thus the original measures, as printed in the Potsdam volume, are as exact as it is possible to make them by the most careful efforts. On the other hand, in computing the catalogue places from the measures, only approximate methods have been used. The Potsdam section of the photographic catalogue will therefore belong to the class of catalogues complete as to numbers, but giving only approximate positions for the stars. There is, however, this important difference from other catalogues of this class, such as the Bonn "Durchmusterung." In the Potsdam work it will always be easy, by the aid of the very accurate original measures, to recalculate the catalogue more closely; or we can even make such calculations for stars that may at any time become especially important. Thus, they have minimized the loss resulting from the necessary curtailment of the Potsdam part of the work. That such curtailment is not altogether unreasonable is easily understood when we remember that even on the present scale, the Potsdam zone will fill twenty quarto volumes, of which the one already issued is but the first.

The Pole Star.—Campbell, of the Lick observatory, has made some very novel observations of the pole star. He finds that it is in reality a very close binary, having a period of revolution occupying about four days, and an orbit probably comparable in size with that of the moon around the earth. There is also considerable evidence that the close double does not constitute the whole of this stellar system. There may be another more distant component, whose effects on the "four-day system" have not yet been fully elucidated.

A Possible Neighbor in Stellar Space.—It has been known from the earliest ages that the fixed stars are in general excessively remote. Nevertheless, astronomers have always cherished a hope that some one star might perhaps be immeasurably nearer to us than the great mass of its companions. Profound as are undoubtedly the outer depths of space, there may yet perhaps exist one other sun swinging through those depths a close companion to our own. It is the hope of finding such a neighboring sun that has led mankind to devote so much diligent effort to the study of stellar distances. It cannot yet be said that this effort has been altogether successful. We have found no "neighbor in space," but we have been rewarded by a whole series of discoveries of scarcely smaller interest. Indeed, it is not too much to say that measurement of stellar distance is essential to a demonstration of the Copernican theory of the universe. This theory supposes the earth to revolve about the sun, instead of occupying an immovable position at the centre of all things. It is therefore obvious that when, in the course of its annual circuit around the sun, the earth is alternately swung far out on one side or the other, there must be a corresponding slight displacement of the apparent directions in which we see the stars. At intervals of six months a star should change its apparent place on the sky a little, moving out from its average position exactly in correspondence with the earth swinging in its orbit. Stellar displacements of this kind are called parallaxic displacements, and to measure them is to determine the star's parallax. It will be seen that the more remote a star is, the smaller will be its parallaxic displacement. Indeed, a star may be so far away that the whole orbit of the earth shrinks into a mere point in comparison. Such a star will have no measurable parallax.

The Copernican theory for centuries suffered from a lack of complete demonstration. No measurable stellar parallaxes could be found. Opponents of the theory

asked: Are we to assume that *all* the stars are immeasurably remote? Indeed, this seemed so unlikely that for a very long time men could not quite believe in Copernicus. It was not until after the middle of this century, when Bessel was able to measure the distance of 61 Cygni beyond a doubt, that this particular objection to the Copernican theory was finally laid at rest. From that time to this, stellar parallax researches have always tended to strengthen our opinion that the stars, while excessively remote, are nevertheless not all immeasurably far away. Stellar systems other than that belonging to our sun have a place within measurable space. Boundless that space may be, but our own little corner, with our own little universe in it, surely has finite limits. We may, therefore, repeat that while the so-called parallax hunters have had no small measure of success, they have not as yet happened on any genuine companion system to our own. We do not know whether our sun, with its attendant planets, is pursuing a solitary way, or whether it forms part of a species of star-stream, having to some extent a common drift through space. There is every reason to believe that such streams exist, a conspicuous example including some of the stars composing the well-known "dipper" in the constellation of the Great Bear.

We have been led to the above considerations by the publication this year of some very interesting parallax researches upon the very same star 61 Cygni to which we have already referred. In the YEAR BOOK for 1898 the peculiar characteristics of this star were described at length. It is remarkable for many other reasons besides the historical one of having been the first to yield to a parallax measurement. It is made up of two component stars, travelling across the sky with nearly the same rate of motion and almost in the same direction. Yet we are not sure it is a true binary, since we have at present no very certain evidence as to gravitational rotation of the two components. Parallax determinations have been numerous since the time of Bessel, but they leave very much in doubt the important question as to whether the two components have equal parallaxes. If not, they are unequally far away from us, and do not belong to one and the same binary system. They must then be themselves sundered by one of those abyssal distances that sometimes stagger the imagination in the study of cosmic astronomy. One other thing is remarkable about this star, something unique, so far as we know. The two components do not retain the same relative positions on the sky. They alternately swing together and again apart. About nineteen months are needed for one such swing back and forth. This peculiarity of motion, which is not a mere orbital revolution, was discovered by Wilsing, of Potsdam, a few years ago, and still awaits confirmation by other observers. In view of all these circumstances, it is not surprising that Schur, of Göttingen, should again take up the parallax problem for this star. He has come upon a result so unexpected that we are compelled to refer to it at some length. But we must first recall briefly the method of studying stellar parallax practically. Suppose a certain star is suspected of having a parallax, or, in other words, of being near enough to allow of measuring its distance. As we have seen, the presence of a measurable parallax shows itself in the form of small displacements of the star on the sky, corresponding to opposite positions of the earth in its orbit. If the star under suspicion has near it some other star which is really immeasurably far away, the effect of parallax will make the suspected star alternately appear to approach and recede from the very distant one. It is by a determination of its position on the sky relatively to the surrounding small stars, therefore, that the parallax of a suspected star can be brought to light and estimated quantitatively. It is true that this involves the assumption that the surrounding stars are themselves immeasurably remote, and therefore without parallaxes. But experience has shown that this can be taken for granted almost invariably. So vast is the scale of the universe, and we have even yet but the very slightest notion of what *space* means. But Schur's measures of 61 Cygni have proved to be one of those unexpected cases where one of the "stars of comparison," as they are called, was itself not free from parallax. The tests applied to 61 Cygni included careful measurements of both components with respect to four small stars not far away on the sky. Observations were made with every effort at precision in the autumn of 1897, the spring and autumn of 1898, and again in the spring of 1899. Four epochs of parallax maximum were therefore observed, and the extreme accuracy of the work is well proved by the inter-agreement of the separate results. Now Schur finds that three of the comparison stars agree in bringing out for 61 Cygni a parallax not very different from the values obtained by previous observers. In other words, this famous star, far away though it undoubtedly is, can nevertheless be brought well within our powers of measurement. But what are we to think of the fourth comparison star? Contrary to all expectations, the observations show that if we are to assume this little star to be indefinitely far away, no satisfactory interpretation is possible with regard to 61 Cygni itself. We are therefore forced to the conclusion that the little star is in reality much nearer to us than is the stellar system of 61 Cygni. Indeed, we find from these ob-

servations that it has very nearly the largest of all known parallaxes. It is, with one exception, our nearest neighbor in space.

This remarkable little star is called W. B. XX 1688. Hitherto an object of no special consequence, it has never received a name, and is known only by its inconspicuous number in Weisse's re-reduction of Bessel's star-catalogue. It is, indeed, fortunate that we find an observation of it even there. For a comparison of the Bessel observation with recent ones contained in the catalogue of the *Astronomische Gesellschaft*, shows that this star has no so-called "proper motion"—that is to say, it is apparently really immovable on the sky, instead of having a slow drift athwart our line of vision. For the reader will recall that most of the fixed stars, and especially those having a very large parallax, are subject to such a drift or proper motion of their own. Here arises a most interesting point. The known drift through space of our own solar system ought to make this little star appear to have a large contrary proper motion. This is a necessary consequence of such close proximity. So we are driven to conclude that the little star itself must be moving in some manner connected with our own system. Its course is more or less parallel with ours, and its velocity approximately equal. If Schur's observations shall be verified, and prove to be correct, it is not too much to hope that we have really at last found our long-sought companion in space.

Astronomical and Astrophysical Society of America.—In the YEAR BOOK for 1898 attention was called to the series of astronomical conferences which have been held annually since 1897, and which we then thought would probably result in the establishment of a formal astronomical society in America. The third conference was held September 6-8 at the Yerkes observatory of the University of Chicago. A permanent organization was finally decided upon, and the following first officers and councillors were elected: President, Simon Newcomb, Washington, D. C.; vice-presidents, Charles A. Young, Princeton, N. J., and George E. Hale, Williams Bay, Wis.; secretary, George C. Comstock, Madison, Wis.; treasurer, C. L. Doolittle, Philadelphia, Penn.; council, E. C. Pickering, Cambridge, Mass.; James E. Keeler, Mount Hamilton, Cal.; F. W. Morley, Cleveland, O.; Ormond Stone, Charlottesville, Va.

The New Telescope of the Potsdam Observatory.—Of no small import to the progress of astronomy is the interest in that science manifested by the German Emperor. It is to his direct interposition that the Potsdam observatory owes its new 32-inch telescope; and we learn that he attended personally at the observatory to take part in the ceremonies connected with the final installation on August 26 of the present year. The Potsdam astrophysical observatory has been in existence only about a quarter of a century, yet it was probably the first institution to be devoted exclusively to this newer branch of astronomy. Its principal achievement has been the study of astrophysics, not as a thing separate and apart from astronomy in the older sense, but as an integral and important portion of the science as a whole. The Potsdam observatory made spectroscopic study an efficient engine of research when it placed upon a firm foundation the method of measuring stellar velocities in the line of sight. The first successful experiments in this direction were made by Huggins, of London; but it was not until photographic methods of obtaining stellar spectra had been perfected at Potsdam that the spectroscope took its proper astronomical rank at the side of the micrometer and meridian circle. But the Potsdam astronomers have hitherto been limited to observing the brighter stars. In order to photograph a spectrum, it is necessary to attach the spectro-photographic apparatus to the eye end of a telescope, so as to profit by the great light-gathering power of the latter. For when starlight is spread out into a spectrum it becomes so faint that we cannot successfully impress the sensitive surface of the photographic plate. To make this possible, we need the large object-glass of a telescope to gather the star's light and concentrate it to a focus. Clearly, then, if we increase greatly the size of our telescope, we can extend spectroscopic observations so as to include stars of only moderate brilliancy. And it is precisely when we wish to use the results of our observations for their most important purpose that we most particularly need measures of the smaller stars as well as the greater. We shall never have an adequate and satisfactory knowledge of the construction and mechanism of our universe until we can make statistical cosmic studies on a large scale, so as to include a very great number of stars of all magnitudes. For these reasons the Potsdam astronomers have repeatedly urged upon the Prussian authorities the desirability of increasing their instrumental equipment by constructing a telescope of the first rank as to size. But this application was without success until it became possible to enlist the interest of the emperor himself in the project. It is now confidently expected that the new instrument will make it possible to extend the Potsdam spectro-photographic survey of the heavens to stars of comparatively moderate size. It is estimated that not less than five hundred will come within the

spectroscopic light-gathering power of the new object-glass. As we have already said, the new lens is of 32 inches diameter, and it has a focal length of about 40 feet. The glass is from the factory of Schott and Co., of Jena, makers of the new varieties of glass now so famous for optical purposes. The grinding was done by Steinheil, of Munich, and the mounting and mechanical work is by the Messrs. Repsold, of Hamburg.

The German nation is to be congratulated upon at last taking its proper place among the nations of the world as the possessor of an astronomical telescope of first-rate size and power.

A New Photographic Telescope.—The YEAR BOOK for 1898 gives an account of the proposed new telescope which has been for some time in course of construction for the Paris Exposition of 1900. The most unusual peculiarity of this instrument is the remarkably large proposed focal length. Another new instrument, also with a very great focal length, is to be constructed at once for the observatory of Harvard College, Cambridge, Mass. It is hoped that these instruments will give us pictures of the planets and stars having the very large scale due to the long focus, and yet free from any compensating disadvantages.

Dark Stars.—Whatever we may think as to theories of cosmic evolution, it is impossible to escape the conviction that the stars may have individually a beginning and an end. However long may be the average star-life, the imagination cannot avoid speculating upon the commencement of that life and upon its probable extinction and end. When we contemplate a universe filled with brilliant points of light, in each of which we cannot but see a blazing sun, it is reasonable to ask: Are there not countless other stars that shone brightly in cosmic ages long since past, stars now but dark and dead? It seems probable, nay, more than probable, that such is the case. In the infinite extension of cosmic time so many stellar systems may indeed have ceased to exist that the dead may outnumber the living manifold. So there is nothing to prevent astronomers from assuming the presence of dark bodies almost anywhere in the universe. At times the observed motions of some visible star are found to disagree with the theoretical considerations of mechanical science. What more plausible than to imagine a companion star, dark, ponderous, massive, by its attraction disturbing the motion of the visible associate. Within the gravitational grip of such an invisible giant the star we see might suffer almost any perturbation of motion. But astronomers are very unwilling to adopt purely speculative theories. They are loath to believe in the existence of what they cannot see. And it must be admitted that such theories open the door to much pseudo-speculation. It is possible to hinder scientific advance by allowing too free a play to the imagination, just as that same imagination rightly used is the necessary moving force with him who would push onward the limiting bounds of human knowledge. Thus, it is desirable in no small degree that we should possess some actual tangible evidence that the dark-star theory is not merely imaginary. Fortunately, such evidence is not lacking.

There are two bright stars which were for a long time suspected of being accompanied with dark companions. Observations of the ordinary kind for determining the positions of these stars on the sky showed that they were at times disturbed a little from their usual place. Sometimes in advance, and then again somewhat retarded, they each showed a purely periodic variation in position. Nothing could be more plausible than to suppose that they had dark companions. In that case, star and companion would revolve about their common centre of gravity, thus throwing the visible star now to one side and now to the other side of its mean or average position. These two bright stars are Sirius and Procyon. In both cases, somewhat to the astonishment of every one, the supposed dark companions were at last actually detected visually. They turned out to be simply very faint stars, not quite dark, and they yielded readily enough to increased telescopic size and power. Sirius's attendant was discovered by Clark in 1862 with the then great telescope constructed for Chicago. But Procyon did not disclose his duplex character to the human eye until 1896, when Schaeberle first saw the tiny attendant point of light with the Lick telescope. These two cases of the actual discovery of an object previously only suspected on account of the gravitational perturbations it produced have, of course, given a strong appearance of verisimilitude to other cases in which the attendant star is still only suspected.

But further evidence of a character entirely different has been furnished from another source, the "variable stars." The reader will remember that the heavens contain numerous stars, whose light varies greatly from time to time. They seem to flicker, as it were, now shining quite brightly, and again losing almost all their light, so as to be seen only with difficulty even in the telescope. In some cases these light variations follow perfectly well-defined laws, which can be determined by observation. And in quite a number of cases the character of the light variation is such

that only one plausible explanation has been possible. We have been compelled to assume the existence of a dark companion accompanying the star we see and occasionally obscuring its light by passing between us and the lucid star. This theory, of course, means that the invisible body is very large, for the obscuration of the bright star may amount to cutting off a very considerable portion of its total light. Consequently, even if the dark companion should pursue an orbit which would at times place it in the most favorable possible position for intercepting the other star's light, it would nevertheless need to be nearly as large as the visible star in order to produce the effects that have been observed. It would be no mere satellite, but an equal companion of the visible star. Now there are, as usual, difficulties in the way. For how could the one twin star be bright, and the other altogether without light? However this may be, we are compelled to admit these supposed dark companions for some of the variable stars, for no other plausible explanation of their phenomena has been offered.

We have recalled the details of this matter thus at length, because of certain researches that have appeared this year and that throw some new light upon the dark-star question. There is a well-known binary star in the constellation Ophiuchus called 70 Ophiuchi. There are two visible components that have always been thought to revolve about their common centre of gravity in an elliptic orbit, and in accordance with Newton's law of gravitation. Now, of all the known binary stars, this one possessed, as we thought, about the best-determined orbit. The observations are so numerous, and the object is one admitting of such precise measurement, that the computed orbit could reasonably be expected to prove altogether satisfactory. It should have sufficed to predict the future motions of the star with all necessary precision for many years. For it is not merely the quantity and quality of the observations that make this binary star exceptional. Even the mathematical discussion of these observations, by which the orbit was obtained, has been effected by Schur, of Göttingen, with quite unusual elaborateness and care.

Astronomers were therefore much astonished to hear not long ago that the relative positions of the two components of this binary system differed very materially from the orbital prediction of Schur. The difference was altogether too large to be ascribed to unavoidable small errors of observation. Clearly the orbit itself was at fault. Investigation of a mathematical character soon showed that it would be difficult to reconcile the new observations with motion under the law of gravitation. Some astronomers were therefore led to postulate a third component of the system, probably quite dark, because altogether invisible in the most powerful telescopes, and revolving as a satellite about the smaller of the two visible components. This hypothesis was to be expected in the light of the considerations already set forth, and it is capable of reconciling these new discordant observations with the old orbit. It has led Moulton, of Chicago, to discuss mathematically in a very interesting way the intricate and difficult question of the mechanical stability of such a system as this hypothesis supposes 70 Ophiuchi to be. This discussion can be found in a recent number of the *Astronomical Journal*. It considers in general a cosmic system, composed of two major bodies, which for convenience are called the star and planet, and a minor body called the satellite, supposed to be revolving about the planet. The stability question at issue now is: Under what conditions can the system here postulated be permanent? Is it possible for such a system to avoid ultimate disruption under the influence of the gravitational forces governing its very existence? Moulton has been compelled to simplify his problem mathematically by assuming certain conditions, limiting somewhat its generality, but not affecting its value. He finds the following remarkable result: We may imagine planet and satellite each surrounded by an oval-shaped figure, and still another large oval enclosing them both. Then the satellite (if existing) may move inside either of the small ovals or outside the large one. But it cannot permanently move in an orbit anywhere else in the system. Furthermore, in some cases, we shall find the two smaller ovals uniting into a sort of hour-glass-shaped figure. When this occurs the neck of the hour-glass offers a passage for the satellite to escape from the planet to the star. This opportunity it would not be slow to embrace whenever the neck of the hour-glass was a large one. Such a system we should call unstable, for even if it could come into existence, it could not last long, astronomically speaking.

Moulton finally applies his mathematical formulas to the special case of 70 Ophiuchi. He finds it impossible that the system could be composed of three bodies revolving in the way that has been supposed. Such a system would not be stable, and cannot therefore be reasonably supposed to have an actual physical existence. The whole matter is left *sub judice*, awaiting further observations and mathematical investigations of the orbit.

Planetoids or Asteroids.—The following is a list of the asteroids discovered since No. 434, the last one mentioned in the YEAR BOOK for 1898.

No.	Temporary Designation.	Discoverer.	Date of Discovery.	Name.
435	DS	Wolf	September 11, 1898	
436	DT	Wolf	September 13, 1898	
437	DP	Charlois	July 16, 1898	
438	DU	Charlois	November 8, 1898	
439	EB	Coddington	October 13, 1898	Ohio
440	EC	Coddington	October 13, 1898	
441	ED	Charlois	December 8, 1898	
442	EE	Wolf	February 15, 1899	
443	EF	Wolf	February 17, 1899	
444	EL	Coggia	March 31, 1899	

Comets.—The following comets have been observed during the year 1899:

1899 *a* was discovered by Swift at the Lowe observatory on March 3. It was visible to the naked eye, though not as a conspicuous object. Later, it was very easily seen, and was described by Holetschek, of Vienna, on May 7, as resembling a hazy star of the third magnitude. At that time the comet's head had a diameter of about four or five minutes of arc, and there was a faint tail about 1° in length. On May 11, Perrine, at the Lick observatory, noticed that the head was separated into two parts. These were distant from one another about $12''$ on the sky. By May 18 this distance had increased to $18''$. On the 20th of the same month, Barnard, at the Yerkes observatory, also noted the duplicity of the comet's head, and found the distance between the two parts $29''$. On the 23d it had increased to $38''$, showing that the two parts were certainly separating. May 18 Barnard succeeded in photographing the comet, and the negative showed a faint tail no less than 8° in length. There was a sudden increase of brightness on June 5, which was noted by a number of different independent observers. After that the comet slowly faded away, until it could no longer be observed. The last telescopic observation was obtained July 31 by Cerulli in Italy.

1899 *b* was discovered by Wolf at Heidelberg, March 5, and proved to be a return of Tuttle's comet.

1899 *c* was discovered by Perrine at the Lick observatory, May 6, and was a return of Tempel's second periodic comet.

1899 *d* was also discovered by Perrine at the Lick observatory. It was first seen on June 10, and turned out to be a return of Holmes's comet.

1899 *e* was discovered by Giacobini at Nice, September 29.

ATHLETICS, FIELD AND TRACK. The field and track athletic season of 1899 was one of considerable interest, especially in intercollegiate circles. The principal matters affecting the clubs were the efforts making toward doing away with the registration, in the larger clubs, of athletes resident in districts far removed from the club city. A movement was instituted also toward preventing the college undergraduate from representing athletic clubs while a member of his college team. The two principal intercollegiate events of the year were the international university games at London, referred to under the topic SPORTS, INTERNATIONAL, and the twenty-fourth annual intercollegiate games at New York, May 26, 27, under the Intercollegiate Association of Amateur Athletes of America. Sixteen of the 28 colleges of this association participated—namely, Boston, Columbia, Cornell, Georgetown, Hamilton, Harvard, Haverford, Lafayette, New York University, Pennsylvania, Princeton, Rutgers, Syracuse, Wesleyan, Williams, and Yale. Pennsylvania won with 57 points; second, Harvard, 28; third, Yale, $22\frac{1}{2}$; fourth, Princeton, 11; fifth, Syracuse, 10; sixth, Cornell and Columbia, 5 each; seventh, Williams, 3. In all, six intercollegiate records were broken: Running broad jump, 24 ft. $4\frac{1}{2}$ in., world's record, Kraenzlein, Pennsylvania; 120-yards hurdle, $15\frac{1}{2}$ sec. (beating the record made by Fox, Harvard, in international games in London), Kraenzlein, Pennsylvania; 2-mile run, 10 min. $3\frac{3}{4}$ sec., Grant, Pennsylvania; 440-yards run, $49\frac{3}{4}$ sec., Long, Columbia; pole-vault, 11 ft. 5 in., R. G. Clapp, Yale; quarter-mile event, bicycle meet, $30\frac{1}{4}$ sec., B. Ripley, Princeton. During the year, also, A. F. Duffy, East Boston A. C., is said to have done 100 yards in $9\frac{1}{4}$ sec., world's record time; Tewkesbury, Pennsylvania, did 120 yards in 12 sec. in the spring, $\frac{1}{4}$ second slower than the world's record; John Flanagan, New York A. C., threw the 16 lb. hammer (7 ft. circle) 167 ft. 8 in., world's record; J. F. Powers, Notre Dame University, succeeded White, Cornell, to the annual individual all-around national athletic championship, by the largest score yet recorded. Cochems, Harvard, established a new strength-test record, with 1761 $\frac{1}{2}$ points.

The Western intercollegiate championships were won by Chicago, 46 points; Notre Dame, 33; Michigan, 27; Wisconsin, 14 (previous champion for three years);

Illinois, 9. Six W. I. C. records were improved. The New England intercollegiate meet was won by Bowdoin, 23 points; Williams, 22; Amherst, 19; Brown, 18½; Wesleyan, 15. The tri-collegiate field meeting in New England was won by Williams, 64 points; Amherst, 38; Wesleyan, 33. An unusual number of dual meets were held in 1899. The eighth annual Harvard-Yale meet for the cup offered by graduates of the two institutions was won by Harvard, 54¼ points; Yale, 41¼; by this victory Harvard won the cup, having defeated Yale the necessary five times. Other dual meets were as follows: Princeton 72 points, Cornell 45; Princeton 61½, Columbia 42½; Chicago 106, Northwestern 38; Chicago 84½, Notre Dame 59½; Cornell 55¼, Syracuse 48½; Wisconsin beat Illinois; California 10 events, Leland Stanford 4. The New England, Middle, Atlantic, Metropolitan, and other divisions of the Amateur Athletic Union held the usual meets in 1899, the A. A. U. national championships being held August 26 at Waltham, Mass. Other important events were the early spring intercollegiate relay races, held by the University of Pennsylvania, and the annual meets of the New York, Knickerbocker, Boston, Chicago, and other large athletic clubs of the country. Abroad, Oxford and Cambridge each won five firsts in their annual dual games, making the result a tie. A half-mile run was added to the list of events in 1899. The year 1899 closed with preparations making for the most important season in history. The most important events were expected to be the Olympic games at Paris, in which nearly every branch of American athletics will be represented, and the international intercollegiate games proposed to be held in America. In connection with the Olympic games, several of the larger athletic clubs and the universities of Cornell, Columbia, Pennsylvania, and Princeton signified their intention of sending representatives abroad. An event of interest in the United States was the announcement of the University of California that it would send a track team to compete in the 1900 intercollegiate games, and to arrange, also, for dual games with some of the large Eastern institutions, including the universities of Columbia, Cornell, Pennsylvania, and Princeton, besides the University of Wisconsin in the Middle West.

ATKINSON, WILLIAM YATES, ex-governor of Georgia, died at his home in Newnan, Ga., August 8, 1899. He was born in the same State at Oakland in 1854. He was educated at the public schools and at the State University in Athens, being graduated from the latter in 1877. In the following year he was admitted to the bar and settled at Newnan. Governor Colquitt appointed him solicitor of the Coweta County Court in 1879, and he retained the position for about three years. Atkinson was elected to the legislature in 1886, 1888, 1890, and 1892, and during his last term was speaker. From 1890 to 1894 he was chairman of the Democratic State executive committee, and in the latter year, after a brilliant and successful contest for the nomination against General Clement A. Evans, was elected to the governor's chair. He was re-elected for the ensuing term. Atkinson was the founder and from 1889 the president of the board of trustees of the Georgia Normal and Industrial College, and from 1890 was a trustee of the University of Georgia.

AUSTRALIAN FEDERATION. The success of the federation movement in Australia was assured in 1899 by vote of New South Wales to adopt the proposed constitution. Before outlining the constitution and describing the situation in 1899, a brief sketch of the origin and history of the movement will be given.

History of the Federation.—Until a comparatively recent date the seven colonies of Australasia—namely, New South Wales, Victoria, South Australia, West Australia, Queensland, Tasmania, and New Zealand—had hardly more close political relations with one another than with foreign countries. But as time went on the interlacing of the colonies by railway lines and the increase in internal trade promoted a consciousness of common interests and led to a movement for closer union. The first sign of such a movement was in the proposal by Earl Grey in 1850 to bring about uniformity in the colonial tariffs, but neither this nor the projects discussed in the next ten years had any definite result. Another plan for concerted action on the part of the colonies was next discussed, and met with more success. It consisted in the holding of conferences from time to time to discuss certain subjects with a view to securing the passage of identical laws on these subjects in the different colonies. Such conferences were held from time to time between 1863 and 1883. Their success, however, did not come up to the expectations of the proposers of this plan. It was often found impossible to secure the adoption by the different colonies of measures approved by the conference. In the meanwhile the colonies had grown rapidly in wealth, and internal trade was increasing. The inconvenience of the customs duties on the intercolonial trade began to

be felt, and suggestions were made looking to a tariff union. At the same time political motives showed themselves. There was anxiety on the score of foreign aggression, and the conviction that the colonies could themselves best deal with matters affecting their own defence was deepened by Germany's seizure of New Guinea. This move on Germany's part had been foreseen by the colonies, and the government of Queensland had annexed the eastern portion of New Guinea, but the Gladstone government disavowed this action, and made light of the colonies' suspicions in regard to Germany. Almost immediately Germany seized the northern portion of New Guinea. These and similar causes led to the strengthening of the union movement in the decade 1880-90. As a result of this a federal council was established in 1884. This was a very imperfect form of union, but is significant as an important step toward more complete federation. The federal council was to deal with a class of specified subjects, and with such other matters as should be brought up by the colonial governments. The bill for the establishment of this council was rejected by the governments of New South Wales and New Zealand, but accepted by the other. It was recognized by the act of the Imperial Parliament in 1885, which permitted the forming of such a council upon the demand of three of the colonies. Several meetings were held between 1886 and 1891, but they had no important results, save to convince the people of the inadequacy of the system. The small membership—only from six to eight members—and the fact that the most important of the colonies, New South Wales, did not support it, deprived it of influence. Still more fatal to its efficiency was the right not only for a colony to refuse to send a delegate, but of a delegate to withdraw whenever a measure objectionable to his own government was adopted. It had no executive, no judiciary, and no control over revenue. The movement for a stronger form of union was set on foot by Sir Henry Parkes in 1889-90. He demanded "a dominion parliament in the dominion of Australia," and the demand being favorably received, a conference was called to consider definite plans for submitting the question to the colonies. The conference adopted resolutions favoring the establishment of a colonial union and providing for a constitutional convention. There was some opposition to this proposal, but it was carried out in the following spring. The convention for drafting the constitution met at Sydney, March 2, 1891. The draft was very similar to that which was subsequently enacted, and of which a summary is given in a succeeding paragraph. The convention then resolved that the colonial parliaments should submit this draft to the people, and, after its adoption by three of the colonies, that it should be referred to the Imperial Parliament for approval. The opposition continued, and checked progress for several years. The parliaments took no action in the matter. At the same time the friends of federation formed a number of federation leagues, which carried on actively the campaign for a federal union. These leagues in 1893 sent delegates to a conference at Bendigo, in Victoria, and it was there decided that the colonial parliaments should be urged to authorize by law the calling of a new constitutional convention, whose members should be chosen by popular suffrage. In order to carry out this plan, a meeting of five premiers was held at Hobart in 1895, and the draft of an act for such a convention was agreed upon, to be submitted to the legislatures of the five colonies which they represented. This convention was to submit the draft of a constitution to the colonial parliaments for discussion, and was then to consider the question of amendments, and the draft was finally to be submitted to the vote of the people. The convention was not held until 1897, when it met at Adelaide, all the colonies except Queensland and New Zealand having agreed to choose delegates. It drew up a federal constitution based on that of 1891, and remained in session until March, 1898, when the constitution was ready for submission to popular vote. It was provided that, if three colonies ratified the constitution, application might be made to the imperial government for an enabling act. There was a definite minimum fixed for the affirmative vote in each state. New South Wales raised the minimum from 50,000 to 80,000, and thus defeated the measure. Victoria, South Australia, and Tasmania gave more than the necessary majorities, but the affirmative vote of New South Wales fell below the minimum. West Australia and Queensland cast no vote. The adverse decision of New South Wales, and the fact that two of the three colonies voting in the affirmative were relatively unimportant, prevented the application for the enabling act from being made. The opposition of New South Wales was attributed to an unwillingness to be a member of a federation in which she did not have a preponderant influence. As the parent colony from which Queensland and Victoria were offshoots, she was unwilling to assume merely an equal footing. She made numerous objections against the proposed constitution, and some of the changes which she suggested were the location of the federal capital in New South Wales, the right to exercise full control over the New South Wales rivers, the payment of bounties by the states and not by the federal government, and the lightening of the financial burden which the new instrument would

lay upon the colony. The modifications proposed by New South Wales did not meet the approval of the other colonies, and for the time being the progress of federation was checked. The proposal of Premier Reid of New South Wales for a conference to submit amendments desired by his government was refused by the other premiers.

Federation Movement in 1899.—On January 26, the premiers of Victoria, West Australia, Tasmania, and Queensland met at Melbourne, and agreed to modify the scheme for federal union in such a manner as would be likely to remove the obstacles to its adoption. The principal change had to do with the financial relations of the states. It was also provided the federal capital should be in New South Wales on federal ground, and at least one hundred miles from Sydney, but that parliament should meet at Melbourne until the government buildings were ready, and that an absolute majority in joint session should prevail when the two houses disagree. These and other changes served to remove the chief grounds of opposition, and the passing of an enabling act was now regarded as certain, since New South Wales pledged itself, through its premier, to accept the federal constitution. In March, South Australia adopted a bill for submitting the scheme to the people. In the legislature of New South Wales there was still a vigorous opposition to the measure, but after the appointment of additional members of the legislative council it was agreed that the amended bill should be submitted to the electors. The vote was taken on June 20, and showed a majority of over 20,000 for federation. The minimum principle was not established. During the summer and early autumn Victoria, Queensland, and Tasmania accepted the federal enabling bill as amended, and the only thing lacking to the establishment of the constitution was the consent of the Imperial Parliament. West Australia refrained from voting on the measure, as it did in 1898, a joint committee of its two houses of parliament reporting that the colony could not safely join the federation until amendments had been made in regard to the election of senators, the customs tariff, and some other matters. It was held, too, that the plan of federation did not safeguard the financial interests of the colony.

The Constitution—General Character.—Three plans were discussed in the course of the debates on federation. The first was that of a loose confederation framed on the basis of the existing federal council, but this received slight support. The second followed the Canadian model and concentrated powers in the hands of the central government without regard to the principle of states' rights or the sentiments of the colonies. These sentiments were too strong to admit of its success. The third plan was based to a large extent upon the American model, being a sort of compromise between the highly centralized system contemplated in the second plan and a system conferring on the states all the powers that they possess under the constitution of the United States. In general, to the federal government were to belong certain specified powers having a much wider range than in the United States, and all powers not expressly delegated were to inhere in the state government, and, while the constitution of this country was appealed to in the discussion of almost every point, there was no exact reproduction of the method of government. In many respects the delegates showed their disapproval of our system. The main points in which they took the United States constitution as a model were in regard to the federal supreme court, the election of senators, the equality of the states, the initiation of money bills, and the relations of the two branches of the legislature.

Federal Powers.—The official title of the new federation is the Commonwealth of Australia, and its component parts are termed no longer colonies, but states. The term original states is applied to those which formed parts of the commonwealth at the time of its establishment. The executive power is vested in the Queen and in her representative, the governor-general. There is also to be an advisory council, known as the federal executive council, whose members shall be chosen by the governor-general and hold office during his pleasure. These members shall be officially known as the Queen's ministers of state for the commonwealth and, until the parliament otherwise provides, they shall not exceed seven in number. The command in chief of the naval and military forces of the commonwealth is vested in the governor-general as the Queen's representative. The legislative power is vested in a federal parliament consisting of two houses—a senate and a house of representatives. The senate is formed on the principle of equal representation for the states, and its members are to be directly chosen by the people of the state. It is provided that until parliament otherwise orders there shall be six senators for each original state. Each senator is to be chosen for a term of six years. The house of representatives is based on the principle of representation according to population. The members shall be chosen for a term of three years. The powers of parliament are very extensive. Among the subjects of its jurisdiction are trade and commerce with other countries, taxation, borrowing money, postal, telegraphic, telephonic and other like subjects, and naval and military defence of the common-

wealth and the various states, insurance other than state insurance, and state insurance when it extends beyond the limits of the state concerned, naturalization and aliens, foreign corporations formed within the limits of the commonwealth, marriage and divorce, invalid and old-age pensions, immigration, quarantine regulations, etc. It is provided also that parliament may assume control of the railways with the consent of a state and may legislate in matters referred to it by the parliament or parliaments of any state or states. This is enough to show the exceedingly wide scope of the federal powers. The chief point of difference between the Australian system and that of the United States is the establishment of ministerial responsibility. This gives the supremacy to the house of representatives, since it is that house to which the ministry is responsible. A discussion of some of the federal powers in detail may throw some light upon the possible workings of the system and upon the difficulties which so long prevented its adoption.

The Financial System.—On the question whether the new federal government should assume the state debts there was much diversity of opinion. It has been estimated that the state debt, inclusive of municipal and county debts, is nearly £200,000,000, and while the states have large assets in the shape of public lands, railways, etc., the burden of this debt is pressing at the present time. A consolidation of the various state debts would, it was hoped, reduce the interest. The federal control was also favored by some in the matter of the railways, since a consolidated system would present fewer difficulties than the present system of state control. The tariff was another cause of dissension. With the exception of New South Wales, all the colonies derived a portion of their revenue from tariff upon the imports from the other colonies and from the outside world. These duties, with their vexatious restraint of internal trade, were viewed with disfavor by many, and there had long been a strong party working for their abolition. West Australia, however, the youngest of the colonies, was unwilling to abandon her tariff, since nearly one-half of her revenue is derived from the duties on goods imported from her neighbors, and the abandonment of the tariff would force her to have recourse to direct taxation. Another problem was the matter of surplus revenue, since it was expected that the new government would receive a revenue in excess of its expenses. In respect to all these matters the new constitution provides as follows: In the first place, the state debts are not for the present assumed by the federal government. The assumption of federal control over the railways is conditioned upon the consent of the state or states in which the railways lie. The system of internal border duties is abandoned, although it is agreed that the federal government shall adopt the policy of protection for the whole commonwealth against foreign countries. As to the distribution of the surplus revenue from the federal tariff and excise, it is provided that "during the period of ten years after the establishment of the commonwealth and thereafter, until the parliament otherwise provides, of the net revenue of the commonwealth from duties of customs and of excise no more than one-fourth shall be applied annually by the commonwealth toward its expenditure. The balance shall, in accordance with its constitution, be paid to the several states and applied toward the payment of interest on debts of the several states taken over by the commonwealth." This arrangement, known as the "Braddon blot," has been criticised for its clumsiness and for the complicated system of book-keeping in which it would result. The limitation of its operation to a period of ten years was due to the insistent demands of New South Wales.

The Relations of the Two Houses.—The great constitutional problem which had to be faced was that of states' rights, the smaller states showing jealousy of the larger and objecting to a system that would base power upon population. This jealousy is one of the things that checked the federation movement, since the delegates from certain colonies were constantly threatening to withdraw when the matter of the distribution of state powers seemed likely to be adjusted in a manner objectionable to their governments. The chief question was that of the control of money bills in parliament, since the possession of this power would, of course, carry with it a paramount influence in the government. The smaller states contended for the principle that the senate should not only have the right to reject, but to amend money bills proposed in the house. A denial of this right to the senate meant control by the popular branch of the legislature. In their desire to prevent this the delegates from the smaller states were willing to give up the cabinet system and to accept a form of government based more precisely upon the model of the United States. An apparent compromise was reached by giving to the house of representatives power to originate money bills and to the senate the power to reject, but not amend them. By money bills are meant taxation bills and bills appropriating money for the ordinary annual expenses of the government. At the same time the senate may return bills with suggested amendments, which the house may incorporate if it sees fit. This really gives the preponderant power to the larger states, since the membership of the house is based on population. The introduction of the cabinet

system prevents equality between the two houses, since the ruling body must be the house, to which the ministry is responsible. Such an arrangement necessarily denies the principle of equality of the states, for the two colonies of Victoria and New South Wales, on account of their superior population, will have a majority in the house of representatives. But the existing system gives the senate power to check legislation, and therefore makes it likely that deadlocks will occur. This result was in fact contemplated by the constituent convention, and a number of remedies were suggested, among others a submission of the matter to direct popular vote. As finally adopted the constitution provides that if the senate rejects a bill passed by the house, a dissolution of parliament may be ordered, and that if the newly elected senate rejects the measure a joint session of the two houses may be called by the governor-general and the question shall be decided by a majority vote. Thus ultimately population will control, but the senate will have the power of interposing a considerable delay.

AUSTRIA-HUNGARY, an empire in the interior of Europe with a frontier of 5396 miles. Its area is 240,942 square miles and its population on December 31, 1890, was 41,358,886, but in 1896 was estimated at 43,800,213.

Agriculture and Mining.—There is great diversity in the natural products of the empire. Agriculture is the chief occupation, furnishing about three-tenths of the population with employment. According to the figures for 1897 the leading crops of cereals in Austria were oats, rye, barley, wheat, maize, pulse, and buckwheat. In Hungary, in 1897, maize was the leading cereal product, and the other principal crops were, in the order of their importance, wheat, oats, barley, and rye. The chief vegetable products in both divisions of the empire were potatoes and beets. In 1895 41.43 per cent. of the land was classified as arable, and in Austria, according to the latest official figures, 36.7 per cent. of the total area was classified as arable and garden lands. Woodlands made up 27.8 per cent. of the total area of Hungary and 32.6 per cent. of the total area of Austria. The forests, which are administered by the government, abound especially in the mountainous districts. The chief minerals of Austria, according to the value of their respective outputs in 1896, were brown coal, black coal, pig-iron, and salt. In Hungary the chief mining products in the order of their value in 1897 were pig-iron, lignite, coal, and iron ore. The other mineral products in the empire include gold, silver, lead, copper, manganese, sulphur, zinc, alum, petroleum, quicksilver, graphite, antimony, and iron pyrites.

Manufactures and Foreign Trade.—The trade of Austria-Hungary for the year 1898, exclusive of specie and the precious metals, was as follows: Imports, \$327,920,000; exports, \$323,048,000. For several years there has been a depression in some of the important industries of the empire and a consequent falling off in the export trade. Official details showing the exact condition of manufactures and foreign trade in 1899 were not available, but the following facts taken from the United States Consular Reports of July, 1899, illustrate the present conditions. In the two important industries of cotton spinning and linen manufacture there has been a marked falling off in the last few years, and in many cases it was reported that the business was carried on at an absolute loss. This decline was clearly manifested in the cotton spinning industry at the close of the year 1896. The operators thereupon made efforts to improve the condition of the industry, but lack of harmony among them prevented the success of these efforts, and, during the year 1897, only 3 per cent. of the product of the Austrian cotton spinning factories sold in foreign markets. This depression continued throughout the year 1898. In the linen industry the exports for 1898 declined both absolutely and relatively from the figure which they reached in 1897. This was partly attributable to the poor flax crop and the diminution of flax culture. It was said that the home product decreased 25 per cent. and the amount of imported flax increased 40 per cent., thus seriously injuring the rural flax producers of the empire. The depression was also attributed to the lowering of prices and to the increasing competition, and it was further complained that taxes and trade regulations tended to hinder the expansion of the industry. The controversy between the two divisions of the empire over the *Ausgleich* was another cause of the depression, since under ordinary conditions one-half of the linen product of Austria is consumed at home, a large part of it being taken in Hungary. The outlook was considered bad in 1899, since the compromise between Austria and Hungary providing that the products of both countries shall be interchanged free of duty seemed likely to be of short duration. It was the policy of the Hungarian leaders to contend for the renewal of the *Ausgleich* only until 1902, when Hungary would adopt a system of protection against Austria as well as against foreign nations, and at the same time take steps to promote the industries within its borders. The condition of the export trade at last drew the attention of the government, and the ministry of commerce submitted a series of suggestions to a conference of exporters on March 8, 1899. These suggestions looked to the promotion of the export trade by sending technical experts to foreign countries to study

and report upon the condition of particular industries. The candidates were required to possess a competent knowledge of languages and of the industries that they represented, and before they left the country to familiarize themselves with the condition of those industries at home. Each expert was to receive a regular compensation from the government, which was to be increased if he proved his fitness for the work, and which was to be supplemented by additional compensation for the business which he brought to his principals, in such manner as might be agreed upon between them. These proposals did not meet with the approval of the industries concerned. The latter complained that the government's plan differed from their own and that it was meant to thwart their purposes. It was predicted also that the experts would probably be chosen for political reasons, and that certain exporters favored by the government would receive all the benefits from the system. The extent to which the racial question enters every field was illustrated in this case by the opposition of certain newspapers on the ground that the scheme bore evidence of the government's desire to propitiate the Czechs and Poles to the disadvantage of the German element. A stronger objection than any of these was the view that government control and management of export transactions was undesirable and impracticable. The government plan was opposed chiefly on the ground of government control, for in its principles it was like that of the exporters themselves. The idea of sending young and energetic business men to study the conditions of certain industries at important centres of trade met with general favor. It was proposed that these experts should be maintained in China, India, Egypt, South Africa, Asia Minor, Japan, and the United States, and that they should remain there for a term of years, understand the language spoken, and possess in advance a thorough knowledge of the industries which they represented. Another method that has recently been discussed for increasing the Austrian export trade is the establishment of colonies, and it was several times reported in 1899 that the government was inclining toward a policy of colonial expansion. Among the means already taken for developing foreign commerce has been the establishment of an export academy at Vienna whose object is to fit young men to become exporters. It is under the direction of the Austrian ministry of commerce. It was designed to meet the complaint of Austrian exporters that the nation had no fit commercial representatives abroad, and was therefore at a great disadvantage in its competition with Germany in foreign markets. The export academy has been made an integral part of the Imperial Royal Commercial Museum, and has the use of its library. The curriculum appears to be well fitted to the object of the institution, and the proposed standard in the matter of attendance and scholarship is high. No more than thirty students are admitted to a class of the academy, and no more than twenty to a class of the preparatory school. The preparatory course lasts one year and is succeeded by the regular course of two years. In 1899 only the first of the two-year courses was opened. Its curriculum includes the French and English languages, domestic and foreign law so far as it concern commerce, and practical exercise in the office work of export, import, and factory businesses. The school hours are long and the student is required to give his time outside only to the languages and the office lessons. There are so-called seminaries in which the economics of tariffs and international trade and usages of the export trade, commercial geography, and a knowledge of the world's products are taught in a practical manner.

In Austria-Hungary and in several other European states there was some alarm expressed at the danger of American competition. The remarkable expansion of American industries was noted there, and the great increase in the exportation of goods from the United States to Europe. A prominent Austrian professor of political economy drew attention to the fact that the exports to Europe from the United States were double the imports from Europe to the United States, and expressed the fear that when the United States had succeeded in placing the sugar production in Cuba and Puerto Rico upon such a footing that it would be sufficient for American needs, the favorable balance of trade would be still larger. Reference was also made to the great increase of the American paper industry, which has outdone that of England. American pig-iron, too, is finding its way into markets which were formerly supplied by other countries, and American machinery was becoming to be known as the best in the world. Progress of chemical science in the United States was also noted as likely to menace the markets of other countries for their chemical products.

Railways, Telegraphs, and Posts.—The length of railways open to traffic in Austria in 1897 was 10,438 miles, in Hungary it was 9784 miles, and in Bosnia and Herzegovina 481 miles. In 1897 there were in Austria 31,484 miles of telegraph line, and the number of messages carried was 13,771,084; in Hungary 13,375 miles of telegraph line, and 13,396,578 messages carried. In 1897 there were in Austria 809,770-220 letters and postal-cards carried in the mails, and in Hungary 236,825,000.

Finance.—According to the *Ausgleich*, a decennial compact which dates from 1867 but expired in 1897, the amount required for the common affairs of the empire is levied after deducting the proceeds of the common customs upon Austria and Hungary, Austria contributing 68.6 per cent. and Hungary 31.4 per cent. This arrangement was continued provisionally during the recent disputes over its renewal for the decennial period. The outcome of these disputes is stated in a succeeding paragraph. The estimates for common affairs for 1899 placed the revenues at 167,175,940 florins, the florin being equivalent to 20.3 cents in United States currency. In 1898 the general debt of the empire was 2,757,449,395 florins. Austria's special debt was 1,470,788,879 florins, and Hungary's in 1897 was 2,477,945,000. There is in addition a common floating debt which in 1898 amounted to 182,672,730 florins.

HISTORY.

Political Situation.—The long-standing disputes over the *Ausgleich* and language ordinances continued in 1899. The *Ausgleich*, it will be remembered, is a decennial pact or compromise, which has bound together the two halves of the monarchy ever since 1867, and which regulates their financial and economic relation. This pact is renewable every ten years. In 1897 the two governments of Vienna and Budapest not being able to come to an understanding upon the renewal for ten years, the compromise was prolonged provisionally. On January 1, 1899, it was prolonged to the close of that year. This prolongation was not the result of legislative action, the opposition of the German Liberals having prevented this, but was brought about solely by virtue of paragraph fourteen in the Austrian constitution, an emergency clause, which gives the government absolute control in default of legislative action. For this resort to an absolute *régime*, parliament was mainly responsible, since the obstructive tactics and the disorderly scenes which marked its sessions had rendered constitutional government impossible. In the meanwhile, the dispute over the language ordinances seemed as far from settlement as ever. These ordinances, it will be remembered, were a modified form of the Badeni measures, and while they did not go as far as the Slavs demanded toward making their tongue the predominant and official language of the Slavic divisions of the empire, they went far enough to provoke the continued opposition of the Germans. For the greater part of the year 1899 the Thun ministry continued in power. In general it followed the policy of its predecessor, the Badeni ministry. It was supported in parliament by all the Slavic and Clerical-German elements and was violently opposed by the German Liberals, who accused it of aiming at federalism and the political destruction of the German element in the empire. This opposition on the part of the German Liberals caused a parliamentary deadlock, and the Thun ministry, finding it impossible to govern by parliamentary means, had recourse to government by ordinances. In this way it secured the financial means for carrying on the government and continued the compromise with Hungary. Its political enemies accused it of aiming to turn Austria into a Slavic empire, of filling the offices with Slavs, and of overthrowing the centralized *régime* in favor of a federal system. The sessions of the *Reichsrath* in the beginning of the year having been marked by the same disorders as characterized its former meetings, Count Thun finally prorogued it on February 1, 1899. The government by ordinances was described as an absolutism, which had been rendered necessary in the circumstances by the failure of constitutional government. The situation was complicated by the fact that in Hungary the compromise which was maintained in operation was not actually voted for, because the parties could not come to an agreement.

Political Situation in Hungary.—The failure of the Hungarian Diet to vote the renewal of the compromise arose from the same obstructive tactics on the part of the opposition at Budapest as were pursued in Vienna. The situation at one time seemed even worse in Hungary than in Austria. Parties could not unite. One of the chief obstacles to reconciliation was Baron Banffy, whose important services to Hungary and to the cause of Liberalism did not mollify the hatred with which he was regarded in certain quarters, especially by the Clericals. Finding that union would be impossible so long as he remained in power, Baron Banffy resigned office on February 26. He was succeeded as prime minister by M. Koloman de Szell, a Liberal, but with less radical views than Baron Banffy. The only changes made in the cabinet were the appointment of M. Alexander Plosz as minister of justice and M. Alexander Hegedus as minister of commerce. The formation of this new ministry put an end to the parliamentary crisis, and the Diet promptly voted the provisional renewal of the compromise. It was now possible for the two halves of the empire to negotiate for the establishment of permanent union. The chances for parliamentary government in Hungary greatly improved, owing to a rearrangement of political parties. A faction of the Nationalists joined the Liberals, and some of the political leaders showed a change of front. See HUNGARY.

Failure of the Thun Ministry.—The Thun ministry had the support not only of the

Slavs and the Clericals, but of the Austrian feudal nobility. On the other hand, the hostility of the Germans both in and out of parliament was extreme. Troubles arose in the frontier districts, and the military were called in to restore order. The Germans accused the authorities of acting in an arbitrary manner and of suppressing every manifestation of opposition to the government by force. Down to the summer of 1899 it seemed as if the Emperor, who had interfered on behalf of the Slavs when Badeni was in power, would continue to support the ministry of his successor, but in the course of the summer there were reports of a change in the imperial policy. It was said that the Austrian ambassador to the court of St. Petersburg had placed in the hands of the Emperor a memorial, which he had found among the papers of Count Kalnoky, whose executor he was, setting forth the injurious effect upon the Austro-German alliance which would surely follow the adoption of an internal policy hostile to the German element. Count Kalnoky deprecated any concession to federalism, and declared that the foreign policy of the empire demanded that the German element should be no longer discriminated against. Soon after this it was evident that the Emperor had resolved to modify the internal policy which was favored by the parliamentary majority, and it was rumored that he was planning to secure the repeal of the language ordinances in the hope of appeasing the Germans and permitting parliamentary business to be resumed in a regular way. The repeal of the ordinances appeared to be the only means of removing the German opposition. The situation was no longer endurable. Austria had been without a parliamentary government since February 1, and the administration had been that of virtual absolutism under the emergency clause of the constitution. The restoration of peace in parliament was necessary in view of the approaching session of the Austro-Hungarian delegations, which decide each year upon the common questions of the dual monarchy. The election of the Austrian delegation required the convocation of the *Reichsrath*, and the question was whether the *Reichsrath* would be of a mind to resume its regular duties. The strong majority of the ministry was thwarted by the obstruction of the Liberal and anti-Slav minority. The elements that supported the ministry tended toward Slavism and Clericalism and, up to a certain point, toward federalism. On the other hand, the Germans made the solution of the language problem in their favor the paramount object of their policy. The struggle was a phase of the wider conflict between Slavism and Germanism in Austria, whose issue will have important effects not only upon the very existence of Austria, but also upon all European politics as soon as the throne becomes vacant. Government by ordinance, which had been going on for a period of nine months, could not be indefinitely prolonged. This was the situation in September, when the election of the Austrian delegation became necessary. There were several expedients for avoiding the necessity of that election, but they were not practicable in view of the fact that any further transgression of law in the domain of common affairs would irritate Hungary, which had demanded that affairs concerning the relations between Austria and Hungary should henceforth be regularly conducted. An effort was made to bring about a compromise between the hostile parties, but it failed. At this juncture the cabinet resigned, knowing that if it remained in power, the Austrian delegation could not be chosen. The Emperor first approached Prince Alfred, of Liechtenstein, but this choice was undesirable, since Liechtenstein represented the tendencies of the Thun ministry, and a neutral ministry was the only one that would be acceptable to all parties. The Emperor, in the course of a journey in Bohemia, and on the occasion of the manœuvres and of a visit to Styria and Tyrol, had frequently declared his opinion that a change in the internal policy of Austria was absolutely necessary, and that in order to bring it about he counted upon the support of the German party in parliament. The prime object was to bring back Austria to the path of constitutional government. In the meanwhile, the language question was causing serious disturbances in the empire.

The Language Difficulty.—As an illustration of the peculiar difficulties involved in the government of the polyglot empire, it may be mentioned that the race feeling penetrates the army itself and often threatens its unity. Until recently it has been the custom for the reservists on presenting themselves before the military authorities to answer to their names in their native tongue. It is evident that a common language for command is necessary. This language was German, and the non-German reservists objected to it. The different nationalities composing the army rebelled against the necessity of signifying their presence by the German word *hier*. Slight as this point seems, it threatened to divide the army by a serious race conflict. The war administration, making this a matter of discipline, took measures to suppress the agitation against the use of a common language for military commands. They demanded now that the reply to the roll-call should be made in German, and all who disobeyed were subjected to military punishment. Many of the reservists did disobey, and were sent to the military prison for breach of discipline. The people took the side of the reservists, accompanying them in a procession to the prison, and

gave them an enthusiastic welcome when they came out after the expiration of their term. This and other evidences of racial antagonism led the crown to demand an immediate reversal of the internal policy, and as a practical step in that direction the prompt suspension in Bohemia and Moravia of the language ordinances. These ordinances had been adopted two years before through the intervention of the crown, and now their repeal was urged from the same quarter.

The New Ministry.—In forming the ministry, the idea was to fill it with officers who were not bound to political parties. The presidency was intrusted to Count Clary-Aldringen, who kept but two ministers of the previous cabinet—namely, Count Welsersheimb, minister of national defence, and Herr de Wittek, minister of railways. The ministry was formed on September 28. Before confronting the *Reichsrath*, which met on October 2, it tried to conciliate the Germans by announcing that the language ordinances would be repealed.

The Language Ordinances.—The language ordinances were immediately abolished, and when the *Reichsrath* met the Germans ceased their opposition. On the other hand, the Poles, Southern Slavs, and Czechs united with the German Clericals and the representatives of the feudal nobility in opposition to the government. Their object was to obtain for all the languages spoken in the empire a footing of equality. Outside parliament some of the districts peopled with Germans were the scene of agitation against the suppression of the ordinances. The movement was mixed up with anti-Semitism. Several shops were plundered and set on fire, and the gendarmes, being hard pressed by a crowd of rioters, fired upon them, killing several and wounding others. In the *Reichsrath* the prevailing opinion was that the gendarmes had had too hasty a recourse to arms. As to the responsibility for the affair, the anti-Semites charged the Czech partisans, and the latter threw the blame upon the anti-Semites. In this state of affairs the Clary cabinet dared not put into force its measures for the repeal of the ordinances. Count Clary announced at the first meeting of the Chamber of Deputies on October 2 that he aimed to establish the parliamentary régime and the respect for the constitution, and that he would not have recourse to government by virtue of paragraph fourteen. As to the suppression of the language ordinances, he promised formally to seek the legal means for solving the language problem, and said the object of the government was to draw up a measure which would meet the needs of every country and conform to the necessities of a uniform administration. The opposition of the majority left all the projects of the ministry unfulfilled. It could not secure a debate upon the military contingent or any discussion of the measures necessary for executing the compromise concluded with Hungary. The question was whether the *Reichsrath* would not be paralyzed again by an obstruction of a new kind—that is, an obstruction offered by the Czechs in place of that which had hitherto come from the Germans. The three chief points in the programme of the ministry were, first the resumption of regular parliamentary business; second, the choice of the Austrian delegation, and third, the passage by the *Reichsrath* before December 31 of certain legislative measures necessary to put in force the compromise with Hungary. The *Ausgleich* had been regularly voted by the Hungarian Diet in June, and its terms were satisfactory to Hungary, but its renewal on the part of Austria was brought about solely by virtue of the ordinance power based on paragraph fourteen of the constitution. According to the provisional renewal of the *Ausgleich*, voted by the Hungarian Diet in June, the previous rules governing the relations of the two parts of the monarchy were to remain in force until December 31, 1907, provided that Austria should renounce the modifications which she had demanded in her favor and which Hungary refused. After the year 1901 the two governments were to negotiate for the renewal of the treaties of commerce for foreign countries, but if by January 1, 1903, they were unable to agree upon the renewal of the *Ausgleich*, after 1907 these treaties of commerce should not be prolonged, except by special arrangement. An autonomous customs tariff should be replaced by a tariff which should take account of the agricultural and industrial interests of the two parts of the monarchy. Existing treaties of commerce should be denounced upon the demand of either of the two governments on January 1, 1903, without waiting for their expiration. The Clary ministry succeeded in carrying out the first and second parts of its programme—namely, the resumption of parliamentary business and the election of the Austrian delegation. In the matter of the *Ausgleich* it failed to obtain the vote of the Austrian Diet. The opposition of the Slavs and Clericals in the *Reichsrath* had at first checked the discussion of the *Ausgleich*, and it was not until the Emperor had personally intervened on behalf of the ministry that a convention was concluded with Hungary. This convention, which was reached after two years of negotiations and of fruitless attempts, changed the proportion of the quota paid by each part of the monarchy for the common expenses. Instead of being 31.4 per cent. for Hungary and 68.6 per cent. for Austria, it became 34.4 per cent. for Hungary and 65.6 per cent. for Austria, which meant an increase in Hungary's share of the common expenses

of 3,000,000 florins, for which she was compensated by a redistribution in her interest of the so-called imposts of consumption. In the Austrian parliament the feudal and Clerical majority were bent on overthrowing the Clary cabinet, and the attempts to reconcile the Czechs with the Germans failed on account of the language dispute. The Czechs demanded that before coming to an understanding with the Germans they should receive satisfaction for the abolition of the language ordinances. They required that in the courts and in all the bureaus in countries where the Czech tongue prevailed that language alone should be used. The open obstruction of the Czechs, together with the passive resistance of the Poles and Clericals, prevented any parliamentary legislation, and as the end of the year approached the government could not obtain a vote upon the budget, upon the military contingent, or upon the imposts, and the compromise with Hungary seemed as far away as ever from the chance of parliamentary adoption.

Ministerial Crisis.—The Clary ministry resigned on December 21, owing to the continued obstruction practised by the majority in the parliament and the impossibility of carrying out its programme. To carry on the administration it was now necessary to vote provisional credits. The Emperor appointed a new ministry under the presidency of Herr de Wittek, the former minister of railways. In the failure of parliamentary action, the Hungarian and Austrian delegations voted a provisional arrangement for the common expenses for four months, and the Emperor, on the strength of the ordinance power intrusted to him by the constitution, fixed for six months the quotas of Austria and Hungary. Thus, at the close of 1899 the monarchy found itself in a dangerous situation. The bad state of political affairs reacted upon the economic interests of the country, and the divergent tendencies of the separate nationalities threatened to lead to further difficulties in the future. The De Wittek ministry, like that which it succeeded, was a ministry of functionaries. So far as the immediate purpose was concerned—namely, to provide for the needs of the state by means of ordinances, it fulfilled its task, but it was of necessity merely transitory.

The Future of the Monarchy.—It has been repeatedly said that the sole tie that binds the discordant nationalities of the empire is their loyalty toward the ruling Emperor, and that after his death the centrifugal forces would be too great to admit of the empire's existence in its present form. Some went so far as to speculate upon the sharers in the doomed empire, claiming that Russia, Germany, and Roumania would divide the lands among them. Some said that the destruction of the empire was inevitable, and that it would occur soon after the death of the Emperor. Others held that it might be prevented by the action of the European powers, and this should be taken, since the balance of power would be endangered by a division of the territory. Such a division, if made, would, it was generally thought, take place on the basis of nationality, and this would lead to some serious complications. Germany, for example, would cease to be Protestant and Prussian, and would become Catholic and Austrian. These speculations had no immediate and practical value, save as indicating the seriousness of the situation and the need of harmonious action on the part of the different nationalities of Austria if the disaster to the empire is to be averted.

AUTOMOBILE. Motor vehicles, or automobiles, as they are now quite generally designated, have been kept constantly before the public during 1899 by means of exhibitions, clubs, races, and trials of various kinds. The company-promoting feature of this industry has, however, shown a welcome tendency to die out, and it may be reasonably expected that in the near future the building and exploiting of motor vehicles will assume the responsible and business-like position of other similar industries. Mechanically the progress of the year in motor vehicles follows along two distinct lines of development. The essential lines of construction have undergone no radical change, but the experienced mechanical engineer has come to the aid of the less skilled originator and has brought about a notable improvement in the design of the various details and in the quality of the material and workmanship employed in manufacturing them. This is the first and, in some respects, the most notable of the two lines of advance; the second is the development of the motor vehicle for freighting work on to a much more satisfactory and successful basis. A brief summary of the chief items of progress in the two directions mentioned develops the following general facts: Oil motors, using preferably light oils, like gasoline, have increased in favor over steam and electric motors for high-speed, long-distance, high-endurance vehicles. The greatest success with steam motors has been with heavy trucks and vans. The electric motor has given the best satisfaction when employed on vehicles for city cab and carriage work and short radius runs. When oil motors are employed the tendency is to increase the number of cylinders, four cylinders being commonly employed, of which two, three, or all four may be brought into play at will. This increase in power has been attended with comparatively little increase in weight, and weight has also been reduced by employing steel and

stamped forgings in place of heavier castings, and by improvements in water-jacket construction, which require a less weight of water to be carried for cylinder-cooling purposes. In the more recent oil motors the objectionable odor has been largely avoided by more perfect carburation and admixture of the richly carburetted air and supplementary pure-air admission, and by greater compression. In the mechanism for transmitting the power to the wheels, chains have been largely discarded for spur-gearing, especially in the heavier classes of vehicles. Compared with earlier practice, gears are now made with greater accuracy, of higher-grade material, and are hardened, and bearings are hardened, ground and perfectly machined. In tire construction the pneumatic tire occupies the first place in public favor, although solid rubber tires are largely employed. The following table shows the principal characteristics of a number of the leading English-built motor vehicles for freight service, tested at Liverpool in July and August, 1899:

NAME.	Wheels, Diameter, ins.	Lat. Dimen- sions, ft.	Roller press, lbs.	Engine horse- power.	Load, tons.	Weight, tons.
Thornycroft.....	33- 39	16 x6½	175	35	3.73	7.465
Thornycroft.....	34- 39	32½x6½	200	40	4.09	8.420
Coulthard.....	33½-35½	15.6x6½	212	14	2.32	4.998
Leyland.....	39- 39	18.1x6.4	200	14	4.44	7.758
Clarkson.....	38- 41	17¾x6.4	200	14	3.85	6.765
Bayley.....	32½-35	16.4x6½	200	22	3.67	7.282

Tests of these vehicles were made for control, manœuvring, hill-climbing, besides general economy, durability, and efficiency, and as the result of them the committee reported that: "The vehicles were suitable for trade purposes in Liverpool and neighborhood and merit recommendation to cart and team owners, and to others requiring to transport heavy loads." See FIRE PROTECTION; GARBAGE AND REFUSE COLLECTION.

AVEROFF, GEORGE, a Greek philanthropist, whose name in this country is known chiefly on account of his gift a few years ago of \$200,000 for the restoration of the Stadium at Athens, died August 3, 1899, in Alexandria, Egypt, at the age of sixty-nine years. He was born at Metsovo, Epirus, his real name being Avieros, but, having removed to Moscow when he was seventeen years old, he changed his name to the Russian form. He inherited from an uncle about half a million dollars, which fortune was greatly increased at the time of the Crimean war, when he supplied large amounts of provisions for the Russian troops. After the war he emigrated to Egypt. It is said that Averoff expended about \$7,500,000 in the erection of public buildings in Greece and in the maintenance of various charitable and philanthropic interests. His restoration of the Stadium at Athens was an important factor in the revival of the Olympic games. Averoff made the Greek navy heir to his fortune, the real estate of which was valued at about \$18,000,000.

AZORES, a group of islands in the Atlantic Ocean west of the kingdom of Portugal. Their area is 1005 square miles, and their population in 1890 was 255,594. Ponta Delgada in the island of San Miguel is the chief town, having a population of 16,769 in 1890, but the usual residence of the government is at Angra in the island of Terceira (pop. 11,067). The islands form a part of the kingdom of Portugal and send deputies to the Portuguese legislature. There is considerable trade in fruit, especially oranges, of which 40,000 boxes were exported in 1897 and 32,000 in 1898. In 1899 a new mail service was established between America and the Azores.

BACILLI. See BACTERIOLOGY.

BACTERIA. See MALARIAL FEVER; MILK; OSTREOTOXISMUS; PHOTO-THERAPY; PLAGUE; PSEUDO-INFLUENZA; SANITATION; SERUM THERAPY; SCARLET FEVER; YELLOW FEVER; SEWAGE PURIFICATION; SEWER GAS; WATER PURIFICATION.

BACTERIOLOGY. A minute bacillus was found in sewage by Klein last year, for which he proposes the name *bacillus pyogenes cloacinus*. The microbe was found to be pathogenic for animals, inoculation producing at times local abscesses, at other times general systemic disease.

Wassermann, of Berlin, discovered, in February, 1899, in the blood, in a case of acute articular rheumatism with chorea, a streptococcus capable of producing joint affections in animals. The microbic origin of chorea was suggested as a possibility by Dana, of New York City, about three years ago.

BADEN, GRAND DUCHY OF, a state of the German empire lying in southern Germany on the eastern bank of the Rhine.

Population, Religion, and Education.—The population, according to the census of 1895, was 1,725,464, an increase of 67,597 over 1890. About 54.7 per cent. of the

1

AUTOMOBILES.—1. The "Royal Mail," Steam Van of England, as it appears in actual use. 2. An English Steam Truck.

population were living in communities of less than 2000 inhabitants. The same census divided the population, according to religions, as follows: Catholics, 1,057,417; Protestants, 637,604; other Christian sects, 7480; Jews, 25,903. In the year 1895-96 there were in the public schools, gymnasias, and universities 347,327 students.

Finance.—The expenditure, according to the budget estimates for the year 1898, was 90,767,566 marks, and the revenue was 83,841,932 marks. Baden has no general debt, but its debt on the railways in 1898 was 329,029,252 marks, a decrease as compared with the preceding year. At the end of the year 1896 there were 1046 miles of railway in the country, of which 871 belonged to the government.

Government.—The chief magistrate is the Grand Duke. The legislature consists of a representative assembly of two chambers, the upper comprising princes of the grand ducal house, representatives of the nobility, the church, and the universities, and eight members nominated by the Grand Duke; and the second comprising 63 popular representatives chosen for four years, 20 for the cities and 43 for the rural districts. The Grand Duchy is represented in the *Bundestag* by 3 members, and in the *Reichstag* by 14 deputies. The reigning Grand Duke is Frederick I., who assumed the title on September 5, 1856. The Grand Duchess is the daughter of Emperor William I.

BADEN-POWELL, ROBERT STEPHENSON SMYTH, who became conspicuous in the Transvaal in 1899, was born on February 22, 1857. He was educated at the Charterhouse and joined the Thirteenth Hussars in 1876, and served in India, Afghanistan, and South Africa. In 1887-89 he served on staff as assistant military secretary in South Africa, and was mentioned in despatches for his operations in Zululand in 1888. He was also assistant military secretary in Malta in 1890-93; was on special service in Ashanti; and chief staff-officer in the campaign in Matabeleland, during which he was brevetted colonel and mentioned in despatches. In 1897 he was promoted to the command of the Fifth Dragoon Guards. Colonel Powell has written *Pig-Sucking or Hlog Hunting*, 1889; *Reconnaissance and Scouting*, 1890; *l'edette*, 1890; *Cavalry Instruction*, 1895; *The Downfall of Premph*, 1896; and *The Matabele Campaign*, 1896.

Colonel Baden-Powell achieved great success at Mafeking in 1899 while commanding a comparatively small force. He resorted to many novel methods of defence and surrounded the town with a railway upon which he ran armored trains. See TRANSVAAL.

BAHAMAS, a British colony, comprise a chain of numerous islands and rocks lying off the southeast coast of Florida between 21° 42' and 27° 34' north latitude and 72° 40' and 79° 5' west longitude, and have an area of about 5450 square miles. Some twenty of the islands are inhabited, the population being in 1891 47,565, and in 1895 50,599. Of these about one-fifth are whites. The principal islands are New Providence, containing the capital Nassau, and having a population of about 11,000; Grand Bahama, San Salvador, Abaco, Harbor Island, Long Island, Eleuthera, Mayaguana, Acklin's Island, Exuma, Crooked Island, Watling's Island, Andros Island, Great Inagua. The government is directed by a governor, Sir Gilbert Thomas Carter, since 1897, who is assisted by an executive council of 9 members, a legislative council of 9 members, and a representative assembly of 29 members. The public debt in 1898 was £118,426. Other statistics of finance and statistics of commerce have been as follows:

	Revenue.	Expenditure.	Imports	Exports.
1896.....	£65,126	£60,134	£194,774	£138,972
1897.....	62,754	63,405	186,010	149,085
1898.....	74,367	64,872	238,336	174,860

The tonnage entered and cleared in foreign shipping in 1897 was 518,217 tons. The chief industry is sponge-gathering, which produced in 1897 an export valued at £90,111, and in 1898 £97,512. Pearls, shells, and ambergris are also found. Fruit and sisal culture are increasing, under the latter there being at present over 20,000 acres. The export of pineapples in 1897 was valued at £24,581, in 1898 £24,360. The imports are chiefly food-stuffs, wines and spirituous liquors, hardware, and cotton, woollen, and silk fabrics. Statistics of education in the islands in 1897 were: 43 government schools, with an enrolment of 5777, and an average attendance of 3894; 31 Anglican schools, with an enrolment of 1771; 28 private schools, with an enrolment of 706; and 11 "aided" schools, with 958 pupils in attendance.

BAHR-EL-GHAZAL, one of the Soudanese provinces of Egypt which was cut off by the Mahdi's revolt, but regained as a result of the Anglo-Egyptian expedition in 1898. It is a well-watered country, and said to possess great natural resources, having an especial abundance of timber. The natives are largely Zandebs, a copper-colored race whose origin is uncertain. The population is variously estimated at from 1,500,000 to 2,000,000. Public attention was centred upon it in 1898 on account

of the conflicting claims of France and England arising out of the Fashoda affair. By the terms of settlement in the convention of March 21, 1899 (see FRANCE, paragraphs on History), it was included with the provinces admitted to be under British and Egyptian control. Its administration is provided for under the convention between Great Britain and Egypt of January 19, 1899, which places the territory along with the other Soudanese provinces under a governor-general appointed by Egypt with the assent of Great Britain. See EGYPT.

BAIN, THOMAS, a Liberal member of the Canadian House of Commons, was elected to the speakership on August 1, 1899, to succeed Sir James Edgar, who had died on the previous day. Mr. Bain was born in 1834 in Stirlingshire, Scotland; when he was three years old his family came to Canada, and settled on a farm in West Flamboro, Wentworth County, Ontario, where he was educated in the public schools and subsequently engaged in farming. He became a member of the town council, and in 1870 was made warden of Wentworth County. In 1872 he sat in Parliament, as a Liberal, for North Wentworth, which he thereafter represented continuously until 1896; since the latter year he has been returned by South Wentworth. Mr. Bain, who is the first farmer to be elected to the speakership, retired from farming in 1877 and has since lived in Dundas.

BAKER, LEWIS, journalist and politician, died in Washington, D. C., April 30, 1899. He was born in Belmont County, O., November 7, 1832. In 1853 he was editor of the Cambridge (Ohio) *Jeffersonian*; from 1863 to 1884 he edited the *Wheeling Daily Register*; the following year he bought the *St. Paul Globe*. He was elected, 1870, State senator in West Virginia. As a representative from Minnesota he sat in the Democratic National Convention of 1892; in the following year President Cleveland appointed him minister to Nicaragua, Costa Rica, and Salvador.

BALIZE. See BRITISH HONDURAS.

BALUCHISTAN, in the southern part of Central Asia, has an estimated area of 130,000 square miles, and an estimated population of 500,000, including both British and independent Baluchistan. British Baluchistan includes Quetta and Bolan, which are administered by British officials who represent the Khan of Khelat, and certain so-called assigned districts which are directly under British rule. Independent Baluchistan is under the government of the Khan of Khelat, who is the head of a confederacy of chiefs, but who is under British influence and acts upon the advice of a British agent. The territory of Baluchistan includes also the tribes of Afghans and Baluchs on the frontier. Quetta is the largest town, but Khelat is the capital. The prevailing religion is Mohammedan. The chief occupation is camel grazing. The chief exports are wood, hides, madder, dried fruits, bdellium, tobacco, and dates. Coal is found in several places and has been worked for some years at Khost. The Bolan and Sind-Pishin railways pass through the country under British jurisdiction, and surveys have been made for a line between Karachi and Quetta. The Khan is Mir Mahmud, who succeeded in 1893.

BAMBERGER, LUDWIG, a German politician and writer on history and economics, died March 14, 1899. He was born at Mentz, July 22, 1823; studied law in 1842-45 at Giessen, Heidelberg, and Göttingen. He took a lively interest in the political movement of 1848, and the following year joined the insurrection in the Palatinate. Upon the failure of this movement Bamberger fled, living thereafter in Switzerland, England, Belgium, Holland, and France. In 1866 he returned to Mentz, and two years later was elected to the customs parliament, and then to the *Reichstag*. Allying himself with the National Liberal party he set forth his free-trade principles with much oratorical skill; he took an active interest in the subject of currency reform. In 1881 he left the National Liberal party, establishing a group of secessionists; in 1884 he joined the German Liberal party, from which he withdrew in 1893. After this time he fought the policy of Bismarck, especially the latter's colonial schemes. Among Bamberger's more important works are: *Monsieur de Bismarck*, 1868; *Vertrauliche Briefe aus dem Zollparlament*, 1870; *Zur Naturgeschichte des französischen Kriegs*, 1871; *Zur deutschen Münzgesetzgebung*, 1873; *Die Zettelbank vor dem Reichstag*, 1874; *Reichsgeld, Studien über Währung und Wechsel*, 1876; *Deutschland und der Socialismus*, 1878; *Die Schicksale des latein Münzbundes*, 1885.

BANFFY, DESIDERIUS, Baron von, Hungarian statesman, resigned the premiership on February 26, 1899. The conflict over the provisional renewal of the *Ausgleich* having continued, Baron Banffy found himself the chief obstacle to reconciliation, since, in the course of his administration, he had incurred the enmity of several of the factions, especially of the Clericals. Parties were divided over the *Ausgleich* question in the Hungarian Diet as they were in the Austrian *Reichsrath*, and the unpopularity of the Banffy ministry aggravated the matter. Banffy's resignation brought general relief. He was afterward appointed master of ceremonies at the

court. His legislative seat in the Hungarian Diet was occupied by M. d'Ugron, the chief of that group of the Left, which Baron Banffy had overthrown in the general elections of 1896. Though Baron Banffy became a member of the Chamber of Magistrates, his resignation was interpreted by many as a virtual retirement from active political life, since his official position was henceforth of a rather ornamental or honorary character. He was born at Klausenberg, Hungary, in 1842, was educated at Leipsic and Berlin, and entered politics as a Liberal. In 1892 he became a member of the cabinet after the general elections, in which he had been chosen a representative from Transylvania. He won the favor of the court by absenting himself from the funeral services of Kossuth and, after the dissolution of the Weckerle-Szilagyi cabinet, he was chosen premier (1895). His popularity increased after his conflict with the Papal Nuncio and the resignation of Count Kalnoky. In 1896 the general elections gave his ministry an immense majority, but his course had offended the Liberal prepossessions of the members of the Diet and, during the latter part of his ministry, he was held in power merely by the unwillingness of the majority to withdraw from his support at the bidding of a factious minority. See AUSTRIA-HUNGARY (paragraphs on History).

BANK—BANKING. *Tendency of Modern Banking.*—An excellent account of the chief features in the evolution of modern banking was given by Mr. C. A. Conant in the *Political Science Quarterly* for December, 1899, and the mention of some of the points brought out in this article may be of present interest. The most conspicuous steps in the evolution of banking are stated in this article as follows: "(1) The predominance of bank-note issues in the early stages of modern banking; (2) the decline in the importance of such notes, as the mechanism of the check and deposit system has grown in favor; (3) the concentration of banking capital in great private banks and the loss of primacy by the national note-issuing banks, except as the custodians of the ultimate banking reserve in times of crisis; and (4) the growth of the principle of mutual support among the banks." The nineteenth century has been the period during which the principles of banking have developed, for, while the Bank of England had previously supplied an important part of the medium of exchange in the seventeenth and eighteenth centuries, the following dates for the foundation of the other great banks of Europe show how recently present conditions were established: The Bank of France, 1800; National Bank of Austria, 1817; the Swiss Bank, 1836; National Bank of Belgium, 1850; Bank of Russia, 1860. While the principle of deposit banking was understood before the note-issuing function was operative, the issue of bank-notes greatly extended the system of deposit banking and introduced it where it could not otherwise have been employed. Wherever the bank deposit system has been highly developed the community has previously passed through a stage of bank-note issue. Note issues have furnished the necessary instruction in the principles of banking, and deposit banking would have been greatly retarded without them. The development of the deposit system in England and Scotland, for example, followed the issue of notes by the banks of those countries, and in France the departmental banks in the early part of the nineteenth century found their chief business in their note issues and discounts. In 1847 their current deposits were only 16,800,000 francs, while their note issues amounted to 90,100,000 francs, with a total capital of 23,400,000 francs. These notes were protected by a reserve in metallic money amounting to 41,700,000 francs. The great service which note issues render the community is the bringing into use of saved-up capital in an automatic and unconscious manner. The acceptance of these notes by business men is practically a loan of capital. The deposit system, on the other hand, attains this end by means of direct transfers of capital from the owners to the banks. In default of these means banks must resort to a high capitalization. This expedient has been followed in Germany, where the Imperial Bank and the state banks of issue have small deposits and a very restricted note circulation. Consequently German banks have greatly increased their capital, and a recent estimate shows that for 100 marks of capital in Germany there are only 50 marks in deposits, while in England there are 1207 marks in deposits. The capital and reserves of the German banks at the close of 1897 amounted to \$100,000,000 more than those of the British banks, while the deposit liabilities of the British banks were many times in excess. The result of this has been a stringency in the money market and a high rate of discount. The Imperial Bank, before the revision of its charter in 1899, could issue only \$73,000,000 in notes based on securities, all issues in excess of this to be covered by specie to the full amount, or to pay a tax of 5 per cent. per annum. The demand for currency has led to the constant increase of the taxed circulation, which rose to 172,000,000 marks at the end of 1897 and to a higher figure at the close of the succeeding year. The effect of the tax has been to cause an increase in the rate of discount.

Besides the bringing into use of saved-up capital, bank-notes perform another valuable function in economizing the precious metals. Again, there is a preference in many communities for paper notes. This is illustrated in France, where the notes of the Bank of France are issued to the amount of \$700,000,000, although they are covered to nearly 90 per cent. by specie reserves. In Austria also the same preference for bank-notes showed itself in 1892, when the government started to retire the notes for silver, but encountered a strong opposition on the ground of the superior convenience of the paper currency. There are many signs that point to the decrease in importance of the bank-note in present banking transactions. It has been pointed out that down to 1830 the Bank of England probably derived its main profits from its bank-note circulation. The limitations imposed upon note issues by the act of 1844 were sharply criticised, but it would seem that the people of England do not suffer from this restraint upon monetary circulation. This is due largely to the development of check and deposit system, which has provided an elastic currency and one whose efficiency is likely to increase as banking progresses. One of the signs of the times is the steady expansion of the discount and deposit system and the stationary or diminishing importance of bank-note circulation. The banks of England, France, and the United States have acquired such enormous reserves through the increase in their deposits and the transfer of deposits by checks is so generally practised that the demand for bank-notes and other forms of money is becoming more and more limited. Another tendency pointed out by the writer mentioned is the superior importance in respect to the volume of the transactions of private and state corporations as compared with the privileged national banks. While the national banks have been the real foundation of credit down to a recent date, their competitors, having a large capital of their depositors at their disposal, have steadily increased in importance, and at the present time the national banks cannot be regarded as the main dispensers of commercial credit. Their chief importance at this time consists in their serving as a reserve force. They form a reservoir of credit. The system of central reserve banks is one of the most striking features of modern banking. The central bank is less likely to be shaken in times of panic than the commercial banks, whose solvency is more closely connected with the financial reputation of their depositors. In order to secure this position of unquestionable credit, which it is essential that any central bank should hold, it was necessary to gain over public opinion, so that the notes of the bank would be as acceptable as metallic money. This has been done. The next thing was to secure the same confidence for the other forms of negotiable paper issued by the banks. Here the great national banks have rendered an important service by acting as the safeguards of credit in times of panic. Along with the development of the one reserve system or the system of central note-issuing banks, there has been a tendency for banks to unite and support each other in times of an emergency. Formerly banks did not yield this mutual support, and the present method has resulted in giving them a strength beyond anything that the older system could afford. The development of the Clearing House Association in the United States is an illustration of this. In Europe, where the banking systems are more concentrated, the clearing house has not been required. The manner in which the Clearing House Association came to the relief of the banks of the United States in 1893 is well known. The idea of the system is that the banks may maintain and expand their loans, that their specie should become a common fund, and that clearing-house certificates should be issued for the settlement of obligations between the banks instead of coin. The great banks in Europe have on several occasions come to the assistance of the smaller institutions in the same way as the Clearing House Association came to the relief of the banks in 1893. In France, for example, in the crisis of 1847, the Bank of France sold securities for gold to relieve the stringency. A better illustration, however, was that afforded by the crisis of 1890 in England, when, upon the failure of Baring Brothers and Company, with liabilities of about £30,000,000, the Bank of England provided for the meeting of all the liabilities of the failed corporation and accomplished this by forming a combination of the chief banking institutions in England, with the result that the panic was averted and that within three years the liabilities were reduced from £30,313,000 to £4,558,813. Thus the distinctive feature of modern banking is the centralization of credit and the formation of institutions which may be termed "bankers' banks." This has added greatly to the amount stored in the main reservoirs of credit. It is estimated that the gold reserves of European banks of issue nearly doubled in the twelve years following 1885, and between 1884 and 1898 it was said that these gold reserves had increased by \$1,000,000,000, while the circulation had increased only \$600,000,000. This increase is shared by the banks of all the leading countries, but Russia holds the first place, the gold reserve of the Bank of Russia having risen from 699,900,000 francs in 1883 to 3,095,400,000 francs in 1897. The following

table quoted from Mr. Conant's article shows the specie reserves and circulation in millions of francs from 1883 to 1897:

Year.	Gold Reserve.	Silver Reserve.	Circulation.	Per Cent. of Gold to Notes.
1883.	3,555.9	2,049.9	12,246.9	29
1888.	4,376.1	2,517.0	12,757.8	34
1890.	4,592.7	2,339.2	13,205.8	35
1892.	6,207.1	2,495.1	14,805.5	42
1894.	6,952.0	2,603.7	15,539.5	45
1896.	7,859.9	2,512.7	14,536.6	54
1897.	8,745.6	2,556.4	15,282.4	57

The effect of the co-operation of the banks and the concentration of credit has been to render the banking credits as good a medium of exchange as gold and silver in advanced communities. A further effect has been to check the injurious results of panics and to prevent runs on the deposits of banks which are known to be sound. There have been many instances in recent years of a readiness to accept banking credits even in times of panic as freely as coin. The metallic basis of these credits will vary with the nature of the community, and cannot be determined on *a priori* principles. When the system is carried to such a point that banking credits shall have as complete a command over commodities as metallic money now possesses, the ideal qualifications of a currency will be attained. That there is a tendency in this direction appears from the banking history of the century. There is a greater security not only for bank-notes but for banking credits. Banks unite and accumulate their cash reserves in a central bank which can meet all demands upon it. There have been frequent incidents of an increase of deposits even in times of panic, since banking credits have been recognized as a safe means of storing circulating capital.

Concentration of Banking Capital.—Toward the close of the year 1899 much discussion was occasioned by the proposed increase of capital of two of the New York City national banks which would bring the capital in each case to \$10,000,000. Many spoke of an era of giant banks, when powerful institutions would gradually absorb or drive out competitors, and bring into the department of banking the same evils which were feared in the case of trusts in the industrial world. It was argued that these mammoth corporations would tend to concentrate too much power in the hands of individuals, and that this power would often be used unwisely and to the public detriment. That there is a tendency toward the concentration of large bodies of capital in the hands of single banking institutions cannot be doubted; but in spite of some conspicuous examples of this in 1899 the movement is by no means new. Nor has it been carried as far in this country as abroad. A capital of \$10,000,000 seems in fact a small matter in comparison with the capital and surplus of some of the great European banking corporations. The following are a few of the chief examples: Bank of England, capital and surplus \$88,500,000, deposits \$268,000,000; Imperial Bank of Germany, capital and surplus \$50,000,000, deposits \$150,000,000; Deutsche Bank (Berlin), capital and surplus \$52,000,000, deposits \$110,000,000; Bank of France, capital and surplus \$45,000,000, deposits \$100,000,000; National Provincial (Great Britain), capital and surplus \$25,000,000, deposits \$256,000,000; London City and Midland, capital and surplus \$22,000,000, deposits \$92,000,000. It is not strange that the movement toward consolidation, which is seen everywhere else in economic affairs, should manifest itself here. The greater economies and the better facilities for producing wealth afforded by concentration of capital in the industries may be attained by the same means in the sphere of finance. Much of the opposition to this movement springs from the same cause as the hostility to the old Bank of the United States, and is a manifestation of the spirit that led to the overthrow of that institution and the creation of the independent treasury of the United States. The experience of this country in the past has bred distrust of the banks, and this often shows itself in the form of opposition to the enlargement of banking functions to meet well-recognized evils in the currency system.

Banking Reform.—The reform of the banking system of the United States with a view to securing greater elasticity of the bank-note circulation is an important part of the currency reform movement, and a discussion in detail of the banking features of the various currency bills that were before the public in 1899 is given in the article CURRENCY REFORM (*q. v.*) The present article deals only with some of the general arguments for banking reform which have been added to those already included in the YEAR BOOK for 1898, and especially such as have been advanced in the secretary of the treasury's annual report, published in December, 1899, and the comptroller

of the currency's report for the fiscal year ending June 30, 1899. These arguments, as representing the conservative views of government officers of experience, have an especial interest. In the first place it is argued that Congress, under the present banking system, necessarily has assumed a large responsibility for the working of the banks. The great object now in view is to secure a flexible currency without impairing in any way its stability. There is reason to believe that this can be done. Some plan must be devised for giving to the banks, under proper limitations, the power of expanding the currency when necessary. Such a power is at present possessed by them in regard to that large portion of the currency which consists of credits. It is well known that the volume of checks and drafts and the interchange of credits between the bank and its dealers make up the bulk of currency, and that money in the sense of gold and silver forms but a small fraction of the actual circulating medium. It is estimated by the secretary of the treasury, for example, that the total money of the country, metallic and paper, is less than \$2,000,000,000, while the deposits of the banks, commercial, state and national, amount to more than \$4,000,000,000. Against this amount of deposits there are checks and drafts each month amounting to over \$8,000,000,000; thus the cashing of these obligations in one-half month suffices to exhaust the entire deposits. But these drafts and credits do not, of course, represent a demand for actual money. They represent merely a transfer of property and credit. Yet they perform an enormous part of the money work, insuring the passage of goods from hand to hand and the settlement of trade accounts. The importance of the function which credit plays in the complex industrial world of to-day can hardly be estimated. The principle of it is fully recognized, and it forms the foundation of by far the greatest portion of modern industry. Under normal conditions there is a satisfactory adjustment of the currency supply to the demand. Bank credits, together with checks and drafts, are sufficiently flexible and responsive to the ordinary changes in the market, but a period regularly occurs in each year when they do not perform the required service. This is at the season when the crops are to be harvested and the cost of labor to be paid. At this season there is a demand for a form of credit which is at once convenient and universally acceptable. Checks and drafts will not suffice on account of the limited spheres in which they are accepted. Cash or paper money is needed at this time. Now, the banking reformers ask why the banks cannot be provided with the means of expanding their circulation at this season. The secretary of the treasury says that, apart from the safety of the note-holder, "it is impossible for any one to name a good reason why the indebtedness of the banker in this field of the exchanges should not be expressed as freely in his notes of hand of convenient size as in one consolidated entry to the credit of his dealer upon his books of account." The severe restraint imposed upon the circulation of national banks and the tax of 10 per cent. upon the notes of state banks prevent the issue of notes to meet these needs, even though the bank balances are in every way adequate for the purpose. The secretary gives the following illustration of this regularly recurring stringency. On August 26 the deposits of the banks of New York amounted to \$858,000,000. Their outstanding loans were \$756,000,000. Their holdings in cash were \$227,000,000. These figures seem to show a satisfactory relation to one another and the reserves appeared to be ample. But the demand for money to meet the expenses of crop gathering now made itself felt. Bankers and merchants having credit balances in the books of the New York banks required currency to meet this demand. Under the system which the banking reformers advocate, the New York banks in these circumstances could have issued their notes in the form of paper money and satisfied the needs of these merchants and bankers. In other words, the credit of the banks would have merely assumed a different form, the book credit being cancelled to the amounts of the notes issued and deposits diminished by so much as the circulating notes increased. The reserves would have remained unchanged and there would have been no alteration in the loan and discount market. Instead of this the banks had to meet this demand by resorting to their cash reserves, and between August 26 and October 14, \$23,000,000 were taken from this fund. This inroad on the reserves prevented the banks from performing their main function—that is, the exchange of credit—and obliged them to prevent the further reduction in their holdings of cash by collecting claims and reducing their credit obligations. The general result was that bank credits fell off within a period of nine weeks to the extent of \$84,000,000. It is to meet such difficulties as this that the various banking reform schemes have been devised. Appeal has been made to certain foreign systems of banking and to systems which have been employed with success in the United States—namely, the New England system and that of New York, Ohio, Indiana and Louisiana. The following points which the secretary mentions as requiring amendment are noticed in most of the currency schemes for reforming the banking system: In the first place it is argued that the requirement of a minimum of capital of \$50,000

as a precedent to the organization of a national bank is excessive, and that in small communities the minimum should be reduced to \$25,000. Secondly, there should be a change in the law regulating the note-issuing function, with a view to extending it so far as is consistent with safety. Thirdly, the limitation upon the loans which any bank may make to a single individual, firm or corporation is said to work with great inequality. Finally, there should be a reasonable relation established between the bank's capital and its ultimate liability. Liability is as fit a subject of legislation as cash reserves. The capital of the bank is the proper guarantee for its solvency as to its deposits. As to the improvement of the note-issuing function, a common feature of most banking provisions of the currency reform measures is the establishment of an emergency circulation. This is urgently advocated by the comptroller of the currency in his annual report. Such an emergency circulation should come into use at those seasons of the year when the gathering of the crops increases the money demand in the manner above indicated, and in general at all times when a tendency toward a financial panic manifests itself. A period of prosperity and of active trade such as the years 1898 and 1899 illustrated was considered a very favorable time for the introduction of this reform. It is argued that the panic of 1893 showed the need of such an emergency circulation. The comptroller illustrates this by the following figures: Between May 4 and October 4, 1893, national bank deposits fell off \$378,767,691; the deposits with other banks fell off \$51,198,856; stocks and securities fell off \$2,177,912. To meet the demand upon them the banks took out a new circulation of \$31,265,616 and borrowed \$36,615,092. But the delay incident to the printing of bank-notes, amounting on the average to 25 days, prevented a large part of the notes which were ordered from being actually circulated. Orders for some \$11,000,000 worth of notes were cancelled. In spite of the issue of notes and the borrowing, the banks had to contract their loans by \$318,767,691. This shows that an emergency circulation would have been needed only for a short time, that it would have lessened the injurious effect of the panic, and that it would not have remained long after the crisis had passed. The comptroller, in common with many others, has recommended that, in order to protect the banks in the community in times of panic, they should be allowed to issue a small amount of uncovered notes in addition to the secured notes, but that this excess should be so heavily taxed that it would not be issued in normal times, but only in times of emergency. The tax would cause the rapid retirement of the notes after the emergency was passed. At the same time it would provide a fund out of which the notes of insolvent banks could be redeemed. The problem of providing a secure and elastic system for the 3600 national banks now in existence is, of course, a difficult one, but even on the principle of bond-secured bank-notes, which is now in force, it would be possible to introduce greater elasticity. The change proposed to this end is that banks shall be allowed to issue notes to the par value of the United States bonds, instead of to 90 per cent. of the par value, as at present. The comptroller's recommendations are as follows: That national bank notes be issued to the par value of the United States bonds, and that the additional 10 per cent. of circulation thus allowed be subject to a tax of 2 or 3 per cent. per annum; that the present tax of 1 per cent. on the circulation be abolished or reduced. The tax of 2 or 3 per cent. upon the 10 per cent. increase of circulation would prevent its being taken out at normal times for profit and save it as an emergency circulation. The following is a brief summary of his views. Even though the provision for an uncovered emergency circulation be not made, there is a means of providing a greater degree of elasticity with a bond-based currency by allowing the national banks to issue notes to the par value of the bonds, subject to a tax of 2 or 3 per cent. He would then abolish or lower the present 1 per cent. tax on circulation with the object of securing an increase in the present issues. He argues that "without any general increase in bank-note circulation, as a result of new legislation, the possible emergency circulation of \$20,000,000 immediately available, based on bonds securing the present circulation, amounts to more than the combined bills payable and rediscounts of all the national banks of the United States outstanding at any time within the last three years."

As to the limitation of loans the comptroller recommends a modification of the law limiting certain loans to 10 per cent. of the capital of the bank. The law should be so changed as to prevent the defective and unequal working of the present provision. See CURRENCY REFORM.

As noted in the 1898 YEAR BOOK, the amount of national bank-notes in circulation has considerably increased since the summer of 1893, when the amount outstanding was \$177,164,255 on June 1. At the end of 1896 the total national bank-notes outstanding were \$235,398,890. There was a gradual decrease until April, 1898. During the rest of 1898 they gradually increased, amounting on October 1

to \$235,356,950. During the year 1899 the increase continued, and on October 31 of that year they aggregated \$243,066,624.

The following report of the comptroller of the currency in 1899 gives the assets and liabilities of national banks and other banking institutions in the United States reporting on June 30, 1899:

	3,588 National Banks.	6,149 Other Banks.	9,732 Banks.
Loans.....	\$2,507,954,980	\$2,659,940,680	\$5,167,895,610
United States bonds.....	346,114,418	173,973,738	530,088,151
Other bonds.....	305,428,927	1,353,621,422	1,659,050,349
Cash.....	512,414,941	210,884,047	723,298,988
Capital.....	604,865,327	368,746,648	973,611,975
Surplus and profits.....	342,321,752	418,798,087	761,119,839
Deposits.....	2,532,157,509	4,346,500,252	6,768,658,361
Total resources.....	4,706,833,904	5,196,177,381	9,905,011,385

The following table shows the population of the different sections of the United States on June 1, 1899; the aggregate capital, surplus, undivided profits, and individual deposits of national banks, etc., on or about June 30, 1899; the average of these items per capita, and the per capita averages in each class of banks and in all banks:

SECTIONS.	Population June 1, 1899.	ALL BANKS.		AVERAGE PER CAPITA.				
		Capital, etc.	Average, per Capita.	National Banks.	State Banks.	Loan and Trust Companies.	Savings Banks.	Private Banks.
New England States.....	5,465,000	\$1,731,281,992	\$314.06	\$104.40	\$2.57	\$38.84	\$174.15	\$0.73

BANKRUPTCY. See UNITED STATES.

BAPTISTS, next to the Roman Catholics and the Methodists, the most numerous of the Christian churches in the United States, comprise (1) the Regular (North), with 5409 ministers, 9020 churches, and 971,671 members; (2) the Regular (South), with 9000 ministers, 18,873 churches, and 1,615,000 members; (3) the Regular (Colored), with 14,000 ministers, 15,000 churches, and 1,555,324 members; (4) the Six Principle Baptists, with 14 ministers, 18 churches, and 937 members; (5) the Seventh-Day Baptists, having 135 ministers, 114 churches, and 9161 members; (6) the Free-Will Baptists, reporting 1312 ministers, 1517 churches, and 85,242 members; (7) the Original Free-Will Baptists (not reported for 1899), but having in 1898 120 ministers, 167 churches, and 12,000 members; (8) the Separate Baptists, with 113 ministers, 103 churches, and 6479 members; (9) the General Baptists, with 450 ministers, 550 churches, and 27,500 members; (10) the United Baptists, not reported in 1899, but in 1898 having 25 ministers, 204 churches, and 13,209 members; (11) the Baptist Church of Christ, with (in 1898) 80 ministers, 152 churches, and 8254 members; (12) the Primitive Baptists, with 2130 ministers, 3530 churches, and 126,000 members (1898), and (13) the Old-Two-Seed-in-the-Spirit-Predestinarian Baptists, with 300 ministers, 473 churches, and 12,851 members. The total number of Baptists in the United States in 1899 was 4,443,628, an increase of 89,201 for the year, with 33,088 ministers and 49,721 churches. The Regular Baptists (North) held a conference at Philadelphia in February. The year was particularly marked by the installation of several presidents in Baptist institutions of learning, notably Brown University. The Colored Baptists have established missions in British East Central Africa and in Cuba. The latest report (1899) of the commissioner of education shows that the Baptists have 54 institutions of learning, with 805 professors, 7223 students, and endowment funds aggregating \$14,590,308.

BAPTIST YOUNG PEOPLE'S UNION OF AMERICA, organized in 1891, and made up of young people's societies in Baptist churches in the United States and Canada. President, John H. Chapman, Chicago; secretary, Rev. E. E. Chivers, D.D., 324 Dearborn Street, Chicago, Ill.

BAR ASSOCIATION, AMERICAN, formed in 1878, held its twenty-second annual meeting at Buffalo, N. Y., August 28-30, 1899. The president's address was delivered by the Hon. Charles F. Manderson, acting president in the absence of Ambassador Choate; the annual address, by Senator William Lindsay, of Kentucky; a paper on New Jersey and the Great Corporations, by Edward Q. Keasbey, of New Jersey, and a paper on the State Punishment of Crime, by Sir William Rann Kennedy, justice of the English High Court of Justice. The association comprises about sixteen hundred of the leading members of the bar in the United States, subdivided into committees, whose principal work includes the reorganization of the federal and judicial system, the adoption of uniform State laws on various subjects, the elevation of the standard of legal education, some amendments of the patent, trade-mark, and copyright laws, etc. President, Senator Charles F. Manderson, Omaha, Neb.; secretary, John Hinkley, 215 N. Charles Street, Baltimore, Md.

BARBADOS, a British colony, is an island, lying east of the Windward Islands, having an area of 166 square miles and a population of about 190,000. The seat of government is the port Bridgetown, having a population of about 21,000. The government is directed by a governor, Sir James Shaw Hay, since 1892, who is assisted by an executive council, an executive committee, a legislative council of nine members, and an elective assembly of twenty-four members. The public debt in 1898 was £414,000. Other statistics of finance and statistics of commerce have been:

	Revenue.	Expenditure	Imports.	Exports.
1896.....	£176,932	£184,020	£1,048,887	£758,228
1897.....	184,606	172,551	1,008,699	736,163
1898.....	182,682	185,840	1,058,885	769,231

Of the trade of 1898 the value of imports from Great Britain was £428,063, and of exports to Great Britain, £35,207. The total tonnage entered and cleared, foreign shipping, was in 1897, 1,335,962 tons.

The acreage of the island is something more than 106,000, of which about 100,000 acres are under cultivation, about 30,000 acres being under sugar culture, the chief industry. The other chief exports are molasses and rum, and the principal imports are textiles, rice, salted meat, and other provisions. The sugar yield amounted to 36,451 hogsheads in 1895, 49,399 hogsheads in 1896, 58,600 hogsheads in 1897. The export of manjak, a bituminous petroleum fuel, in 1897 was 1880 tons, valued at £3760. The value of the fish catch is about £17,000 annually. The registered shipping of Barbados in 1897 comprised 50 vessels, 48 sail and 2 steam, having a total tonnage of 7105 tons net. There are 470 miles of roads, 24 miles of railway, and 24 miles of telegraph and 635 miles of telephone lines. The Colonial Bank has a paid-up capital of £600,000; deposits in the Government Savings Bank on December 31, 1898, amounted to £218,573.

Religious statistics in 1891 were: Church of England, 156,539; Wesleyans, 14,485; Moravians, 6801; Roman Catholics, 816; Jews, 21. An annual legislative grant of £11,220 is made to the religious bodies and apportioned as follows: Church of England, £10,070; Wesleyan, £700; Moravian, £400; Roman Catholics, £50. Education, which is under government direction, is in a very good condition; the yearly government grant for public instruction is about £11,500. Besides schools for secondary and higher education, there were in 1897, 179 primary schools, with an average attendance of 15,556 pupils. There are published on the island three daily, two weekly, two bi-weekly, and two monthly papers. Barbados is the headquarters of British troops in the West Indies; the garrison comprises about 850 officers and men.

On September 10, 1898, a terrible hurricane swept over the Lesser Antilles, doing great damage, especially in Barbados, St. Vincent, St. Lucia, St. Kitts, Nevis, Montserrat, the Grenadines, Anguilla, Barbuda, and Trinidad. In these islands many hundreds lost their lives and thousands were left homeless and destitute. In Barbados the houses of 11,426 laborers were demolished and 4918 were damaged. Aid was rendered by the imperial authorities. The great West Indian hurricane of August 7 and 8, 1899, touched Barbados, but was not as disastrous to this island as was the former. During 1899 relief measures on the part of the imperial government for the improvement of West Indian industries and commerce were being carried into effect; one of the measures was a loan of £120,000 for the establishment of central sugar factories in Barbados. For a further account of the matter see WEST INDIES.

BARBER SHOP. See **HYGIENE.**

BARITES. The production of barites in 1898 amounted to 29,306 short tons, value \$108,339, as against 26,002 tons, value \$58,295, in 1897, an increase of about 25 per cent. Barite is used as a substitute for white lead in the manufacture of paints. The chief source of supply is Missouri, where the material occurs in veins, and more or less stained with iron. In the process of preparation for market the barite has to be ground very fine, then boiled in sulphuric acid, to remove the iron stains, after which it is washed to remove the acid. The ground and purified product is then separated by the process of filtration in water, the very fine particles being carried off in suspension, and forming first grade, while those which settle rapidly form the second grade of the product. As an adulterant of white lead it is practically harmless, and possesses the advantages of being not only cheaper, but also not being affected or discolored by acid vapors that may be in the atmosphere.

BARLEY The following table, published by the department of agriculture, division of statistics, shows the acreage, production, and value of barley in the United States in 1899:

STATES AND TERRITORIES.	Acreage.	Average yield per acre.	Production.	Average farm price Dec. 1.	Farm value Dec. 1.

BARNARD, GEORGE GREY, American sculptor, born in Bellefonte, Penn., May 24, 1863, received his training at the Chicago Art Institute, and in 1884-87 studied at the Ecole National des Beaux Arts, Paris. He attracted attention at the Paris Salon, and, returning to America, exhibited his works in New York. His "God Pan" was placed in Central Park; "Two Natures" in the Metropolitan Museum, and his "Brotherly Love" is in Norway. In 1899 he finished "The Hower," which is one of a proposed colossal group destined to stand in a vessel that is to represent the ship of life.

BAR OF THE CITY OF NEW YORK, THE ASSOCIATION OF THE, organized in 1869 and incorporated in 1871, was "established to maintain the honor and dignity of the profession of the law, to increase its usefulness in promoting the due administration of justice, and to cultivate social intercourse among its members." It owns and occupies a commodious building at 42 West Forty-fourth Street, New York City, and possesses a law library of 51,454 volumes, at a cost of \$178,557.48. The admission fee is \$100; annual dues, resident members, \$20 to \$40; non-resident members, exempt. The last report showed 1441 resident members, 114 non-resident members, and 22 honorary members. President, James C. Carter; corresponding secretary, B. Aymar Sands; librarian, William F. Kip.

BARON DE HIRSCH FUND of \$2,500,000, given by the late Baron Maurice de Hirsch, for the aiding of Russian and Roumanian Jewish immigrants. The

committee intrusted with the administration of the annual income of this fund, which amounts to \$100,000, provides for the reception of immigrants, their instruction in the English language and mechanical education, and advises them as to acquiring rural homes, grants, loans, etc. Six hundred Jewish families have been settled on New England farms and 400 in New Jersey. The Woodbine Agricultural and Industrial School, New Jersey, has now 69 pupils. In co-operation with the Baron de Hirsch fund is the Jewish Colonization Association, which was founded by Baron de Hirsch. See **HIRSCH**, **CLARA DE**.

BARRETT, **JOHN**, former United States minister to Siam, was born at Grafton, Vt., November 28, 1866. After his graduation at Dartmouth College, in 1889, he went to the Pacific coast and taught for a term in Hopkins Academy, Oakland, Cal. He then engaged in journalism in Tacoma, and later in Portland, where he was associate editor of the *Evening Telegram* until 1893. In the previous year Mr. Barrett was a delegate to the national Democratic convention in Chicago. In 1894 he was appointed minister resident and consul-general at Bangkok, Siam, where he remained until 1898. From May to September of the latter year he was a correspondent at Manila for New York, Chicago, and San Francisco papers. In 1899 he published a number of articles on the Philippines advocating the retention of the islands and the establishment there of American authority.

BASEBALL. Public appreciation of baseball, as relating to the game played by the league clubs of the country, continues to decline. There is a growing realization of the killing effect of paid professionalism on the spirit of the game, and the mismanagement and discord in league councils, together with the disgraceful rowdiness of many of the players, has cost league baseball the support of thousands of admirers of the sport. "Syndicate" ownership of certain clubs and too large a circuit in some of the leagues are assigned as causes of popular dissatisfaction. As the remedies suggested look mainly toward the increase of financial profits, there is little hope of an improvement in the spirit of the game. Late in 1899 the new American League threatened to supersede the National League in the management of the major clubs. Brooklyn won the National League championship of 1899 with 101 victories and 47 defeats, 68.2 per cent.; second, Boston, 95 victories; third, Philadelphia, 94 victories. Among the minor clubs, Indianapolis won the Western League championship and Rochester that of the Eastern League. The East defeated the West in the intersectional campaigns, 284 aggregate victories to 206. The intercollegiate series between Harvard, Yale, and Princeton, the most prominent university teams, was won by Princeton. Other Eastern college teams which played successfully were: Pennsylvania, Virginia, Lafayette, Manhattan, Cornell, Brown, Georgetown, and Holy Cross. The amateur campaign in the South and West showed an increasing development among the college teams.

BASUTOLAND, a British colony in South Africa, lying to the northeast of Cape Colony, and having an estimated area of 10,293 square miles and an estimated population, in 1896, of 250,000. The chief town is Maseru, with a population of 862, of whom about 100 were Europeans. It is well-watered and fertile, and is especially adapted for the production of grain. Its chief products are wheat, wool, mealies, and Kaffir corn. Coal is worked, and there are signs of copper and iron. The exports are chiefly grain, cattle, and wool. The foreign trade is with Cape Colony and the Orange Free State. The colonial government has done much recently to promote education and to extend and improve the roads. The revenues have advanced slowly but steadily since 1891. There is telegraphic communication with Cape Colony and postal communication with Cape Colony and the Orange Free State. The colony is governed by the resident commissioner (Sir G. Y. Lagden in 1899), who is under the direction of the high commissioner for South Africa. In 1898-99 the government granted in aid of education the sum of £4449. Nine-tenths of the scholars, who numbered 9714 at a recent enumeration, are in the schools of the French Protestant Mission. The revenue is obtained from the contribution of Cape Colony and from the post-offices, the native hut tax, and the sale of licenses. The European inhabitants number about 600. The prosperity of the colony has been checked of recent years by the ravages of the rinderpest. Internal disturbances have also retarded development. In February, 1898, the colonial authorities put down a revolt of natives and captured the leaders. During the rest of that year and the following year a fair degree of order was maintained, and, in spite of the Transvaal war and the proclamation of the Orange Free State annexing the northern part of the colony, the Basutos remained quiet. A meeting of the native chiefs was called in October in view of certain supposed attempts of the Boers to enlist their aid, and a pledge was given that the nation would remain loyal to the British government.

BATHS, MUNICIPAL. See **MUNICIPAL BATHS**.

BAUXITE. See **ALUMINIUM**.

BAVARIA, a kingdom of southern Germany, forming part of the German empire, has an area of 29,286 square miles and a population (1895) of 5,818,544, of whom 4,112,623 were Roman Catholics, 1,640,133 Protestants, and 53,750 Jews.

Production.—The chief crops are rye, oats, barley, wheat, potatoes, and hay. Fruits, vegetables, and tobacco are also produced. The cultivation of the vine is an important industry. The production of wine in 1896 was 1,288,578 hectolitres, and in 1897, 521,524 hectolitres. Beer brewing is still more important. In Munich alone there are 25 breweries, which, between July 1, 1897, and July 1, 1898, turned out 71,095,395 gallons. It is estimated that Munich exports to other parts of Germany and to foreign countries about 25,000,000 gallons.

Finance.—The chief sources of revenue are the railways, posts, telegraphs, mines, etc., indirect taxes, state domains, direct taxes and fines, etc. The chief branches of expenditure are the cost of administration, contribution to imperial expenditure, and the service of the public debt. The public debt at the end of the year 1897 was 1,415,219,964 marks. Of the 3908 miles of railway, 3335 belong to the state.

BAXTER, ELISHA, ex-governor of Arkansas, died at Batesville, Ark., June 2, 1899. He was born in Rutherford County, N. C., September 1, 1827; was educated in the public schools of his county, and when a young man removed to Arkansas and became mayor of Batesville in 1853. He served in the State legislature in 1854 and in 1858. After the outbreak of the Civil War he entered the Union service, and in 1863 was promoted to the colonelcy of the Fourth Arkansas Mounted Infantry. At the close of the war he was elected to the United States Senate, but was not allowed to take his seat, as Arkansas had not yet been legally reconstructed. From 1868 to 1872 he was judge of the third judicial district. In the spring of the latter year Baxter was nominated for governor by the administration, or Grant, wing of the Republican party. The contest between him and Joseph Brooks, the candidate of the Liberal, or Greeley, wing, who also was largely favored by the Democrats, was one of the most bitter in the history of the State. Baxter was declared elected, but the Brooks party, alleging fraud, took the matter to the legislature, and later to the State Supreme Court. Brooks finally obtained a judgment against Baxter, and attempted forcibly to eject him from office. The quarrel spread to the adherents of both men, and bloodshed was prevented only by the presence of federal troops. Both parties appealed to President Grant, who decided in favor of Baxter, the decision, however, not being rendered until May, 1874. In the fall of that year Arkansas adopted a new State constitution, which reduced the gubernatorial term from four to two years; soon after, therefore, Baxter retired from office. In a message to Congress, February 8, 1875, President Grant stated that he had finally come to believe that Brooks, and not Baxter, had been chosen by the electorate.

BEAUFORT, Eighth Duke of, HENRY CHARLES FITZROY SOMERSET, K.G., died April 30, 1899. He was born February 1, 1824, and was educated at Eton. From 1846 to 1853 he was member of Parliament for East Gloucestershire. In 1858 he entered the British army as a lieutenant-colonel, and retired in 1861. His son, the Marquis of Worcester, succeeded to the title.

BECHUANALAND. See RHODESIA.

BECCUE, HENRI FRANÇOIS, French dramatist, died May 2, 1899. He was born in Paris, April 9, 1837. In 1867 appeared his first dramatic work, *Sardanapale*, a libretto for which Victorin de Joncières wrote the music. In the following year the drama *L'enfant prodigue* appeared, and in 1870 his five-act socialistic play, *Michel Pauper*. The play attracted scarcely any notice at the time on account of the popular interest in the war, but when, in 1886, it was presented again, it evoked but little praise. Becque, who was a pioneer in the field of the realistic drama, brought out *L'Enlèvement*, which also failed to receive popular applause. Disappointed at these failures, he turned his attention to the work of lighter comedy, and in 1878 published *La navette*, and two years later, *Les honnêtes femmes*, which plays improved his reputation. In 1880, however, appeared his *Les Corbeaux*, a dismal drama of family life, which received much condemnation, but which served to fix his position as an innovator. *La Parisienne* appeared in 1885. Becque's other writings include *Théâtre complet*, two volumes, 1890; *Querelles littéraires*, published about the same time, and various newspaper and magazine contributions on subjects of the theatre, literature, and art.

BEHRING SEA. See SEALING.

BELGIUM, a kingdom of western Europe, has an area of 11,373 square miles and a population on December 31, 1897, of 6,586,593, giving a density of 579.1 persons per square mile. A later estimate, December 31, 1898, gives the population at

6,669,732, or 586 to the square mile. There are 3,343,542 females and 3,326,190 males. According to the census returns of 1890, there were 2,485,072 who could speak French only and 2,744,271 who could speak Flemish only. Nearly the whole population professes the Roman Catholic faith, the Protestants numbering about 10,000 and the Jews 4000. The capital is Brussels, with a population on December 31, 1897, of 551,011, including the suburbs. Other cities over 100,000 population are Antwerp, Liège, and Ghent.

Government.—Belgium is a constitutional, representative, and hereditary monarchy. The constitution, dating from 1831, vests the legislative power in the king, the senate, and the chamber of representatives. All the representatives and the majority of the senators are elected directly by the people, the former for four years and the latter for eight years. A portion of the senators (26 out of 102) are elected indirectly by the people—that is, by the provincial councils. The law of September 7, 1893, introduced the principle of plural voting, as described in a subsequent paragraph. In 1897 the united constituencies numbered 1,407,000 voters, with 2,170,000 votes.

Finance.—In 1898 the total ordinary revenue was 388,298,598 francs and the total ordinary expenditure, 385,278,702 francs. The budget for 1899 estimated the total revenue at 435,037,428 francs. In 1898 the national debt, which consisted of a share of the Netherlands debt at $2\frac{1}{2}\%$ and loans at 3% , amounted to 2,566,593,476 francs.

Shipping, Post-offices, and Telegraphs.—In 1898 the merchant marine in Belgium consisted only of 66 vessels and about 600 fishing-boats. Most of the carrying trade was in the hands of foreign vessels. On December 31, 1897, the total tonnage of vessels entered and cleared in Belgian ports was 15,899,475. The working of the post-office in Belgium was in 1897 as follows: Private letters, 117,848,690; printed matter, 96,456,423; newspapers, 110,587,241; postal-cards, 49,420,449, and official letters, 23,145,817. On January 1, 1897, there were 893 post-offices and 1026 telegraph offices. The total length of public telegraph lines was 3955 miles and the length of wires was 41,895. In 1898 the railway mileage open for traffic was 2850, of which 2057 was the property of the state.

Commerce.—In 1897 the general imports amounted to 3,090,829,820 francs and the general exports to 2,837,271,890 francs, a considerable increase over the preceding year. In 1897 Belgium exported to Germany goods to the value of 363,254,000 francs; to France, 297,938,000 francs; to Great Britain, 302,085,000 francs; to the Netherlands, 184,683,000 francs, and to the United States, 60,436,000 francs. The value of its imports from these countries in the same year was from Germany 233,972,000 francs; from France, 296,583,000 francs; from Great Britain, 275,566,000 francs; from the Netherlands, 159,271,000 francs, and from the United States, 231,743,000 francs. The chief articles of export were yarns, linen, wool, etc., coal and coke, cereals, textiles (raw), machinery, carriages, glass, iron, chemicals and drugs. The general articles of import were classified under the heads of cereals, textiles (raw), chemicals and drugs, timber, etc. The figures showing the value of imports and exports for the entire year were not available in 1899, but the following statistics, published in the United States Consular Reports of September, 1899, compare the first five months of that year with the year just preceding. The imports during the first five months of 1898 were \$152,427,540, and during the same period of the year 1899, \$159,790,490, an increase of about five per cent. The exports for the first five months of 1898 were \$125,478,564, and for the same period of 1899 \$128,342,491, an increase of two per cent. The customs duties during the first five months of 1899 amounted to \$3,856,182, an increase of about \$215,000 as compared with 1898. In the first five months of 1898 the number of vessels entered was 3345, with a tonnage of 3,352,995, and in the same period of 1899 the number of vessels entered was 3432, with a tonnage of 3,471,541. The most important articles imported into Belgium from the United States during these respective periods were Indian corn, wheat, spelt, meslin, petroleum (refined), oil cakes, tar, asphalt, etc., cotton and vegetable oils.

The Tariff.—Belgium was under a tariff revenue only from 1861 to 1884, when the government levied an import duty upon cattle and meats; in 1896 a duty upon oats, butter, etc., was also levied. The policy is practically that of free trade, but efforts have recently been made to introduce the protective system. At the close of 1898 and at the beginning of 1899 a bill, changing the tariff regulations, was under discussion. These changes affected the existing system of levying customs duties on goods taxable *ad valorem*. The new regulations required that the custom-house declaration for goods thus taxed must mention the value, place of origin, and place of manufacture, with the added cost of packing, transportation, etc., and that if the value declared is judged insufficient by the customs officer, he may demand from the importer a supplementary declaration and the immediate payment of the extra duty due. An arbitration commission, composed of five members, is appointed to decide in case of litigation the value of the goods imported, and in estimating their

value the commission may employ experts. If the commission verifies the correctness of the value declared by the importer, an indemnity of delay is awarded to the latter. The representatives of the foreign chambers of commerce requested certain amendments in the proposed law, objecting to the delay which would result in the delivery of the goods if the new law should be adopted and to the doing away with the system of preemption as practised at present. They agreed, however, to abandon the bonus of ten per cent. which the government pays in addition to the value of seized goods.

Efforts to Promote Trade.—Of late years there has been an attempt to develop a merchant marine. Belgian commerce is not important. For many years Belgian capital has been turned away from maritime enterprises into other channels, and instead of trading with distant countries, she has confined her trade mostly to her neighbors. Many favor the making of special efforts to encourage the building of sailing vessels, and urge the subsidizing of these vessels if it be found that they cannot compete with steamers. The progress recently made by Germany, and especially the great commercial advancement of England, have roused an interest on the part of Belgians in the development of their foreign trade. State aid is demanded until it be shown that the industry of ship-building can maintain itself. Another feature of the recent movement to develop Belgian commerce is the increasing interest in commercial education. At Antwerp there is a commercial institute, at which a diploma is given at the end of two years, except for those preparing for the Belgian consular service, who are required to pursue a course of three years. Practical as well as theoretical instruction is given, and the students are required to understand the transactions of commercial and counting-houses and matters relating to the theory of exchanges. A knowledge of French, German, and English is obligatory, and the student must also be able to correspond in one other language. The courses include political economy, international commercial law, and customs legislation. Travelling scholarships are imposed upon the most deserving students, a sum of nearly \$10,000 being devoted to this purpose each year. Many students have been sent abroad, especially to those countries in which Belgium is seeking to find a market. The expenses of attendance are comparatively slight, the tuition fee being about \$50 for the first year and \$60 for the second. In the interest of Belgian commerce plans for an important international exposition at Liege were discussed in 1899. The exposition will be held about May 1, 1903, and last six months, under the patronage of the Belgian government and the province and city of Liege. The exposition is said to be planned on a more extensive scale than that of Antwerp in 1894 or that of Brussels in 1897, and the buildings are expected to be begun early in 1900. Leading men of Liege were engaged in promoting the enterprise. Some comment was occasioned in 1899 by the restriction imposed by the Belgian government on the United States fruits and plants. The law of December 30, 1882, authorized the government to prescribe by royal order such measures as the fear of contagious diseases of domestic animals and plants may require in the regulation of commercial relations with foreign countries. Under this law a royal decree, dated February 3, 1899, prescribes that the importation and transit of fresh fruits, living plants, and fresh parts of plants, sent from the United States to Belgium, shall take place only by the ports of Antwerp, Ghent, and Ostend, and upon the production of a certificate from competent authority attesting that the products therein specified are not contaminated by the San José scale, this order to go into effect on March 15, 1899. In carrying out this decree, experts were appointed at Antwerp, Ghent, and Ostend to inspect these fruits and plants and supply certificates of examination.

From June 1 to September 1, 1899, an exposition of industries and arts was held in the city of Ghent. The display consisted almost entirely of machinery, including weaving, spinning, artificial ice, steam laundry, feed-cutters, boilers, engines, steam-pumps, coffee-grinders, and carpenters' and machinists' tools. The industries of the United States, England, Germany, and France were represented.

Political Parties.—The year 1899 marks a turning-point in the internal history of Belgium. The following account outlining the recent struggles of political parties and the outcome of these struggles is based mainly on the authority of M. Alexandre Halot, a contributor to the *Revue des Deux Mondes*. For fifty years political power has oscillated between the two parties named respectively Liberal and Catholic. At first these parties did not show the sharp antagonism toward each other that has marked their attitude in recent years. The Liberal party was by no means aggressive in its opposition to the religious programme of the Catholics. The general difference between them was that while the Liberal party held somewhat strictly to the doctrines of 1789, the Catholic party was more reactionary in spirit, although it adhered to the liberal constitution of 1831. But as time went on the issues became more distinctly defined. The Catholic party held to a purely ecclesiastical programme, and seemed to regard the defence of religious orthodoxy as its sole end.

The Liberals, on the other hand, especially that advanced wing called Radicals, gradually assumed an aggressive attitude toward religion, as if its main duty was to destroy the religious faith of as many citizens as possible. It was a contest between extremists, and left the region of practical politics for the debating ground of philosophy and religion. In these circumstances neither party represented the average opinion of the Belgian people, who, while attached to the Catholic faith, were by no means bigoted, and in general were opposed to the direct interference of the Church in political affairs. Complete political independence, combined with respect for the traditional faith of the people, was what the majority of the Belgians seemed to demand. The political parties, on the other hand, carried away by the extremist spirit of their leaders, became further and further separated from the general sympathies of the people at large. Whichever party came into power, it took no pains to satisfy the moderate class of deputies or of voters, but usually tried only to please its least moderate partisans. As a result of this, it often happened that the moderate voters, by whose support the party had gained power, turned against it at the moment of its triumph. The political history of Belgium is a record of these ups and downs. The triumph of one party was a signal for undoing everything that its predecessor had done, and for an exaggerated display of its religious or anti-religious tendencies. It was as if each party held itself to be the sole depository of absolute truth, in regard to which any form of compromise was sinful. Political dogmatism of the most irreconcilable kind was characteristic of party politics. On the one hand was M. Friere Orban, the Liberal doctrinaire, and on the other the ultra-Catholic, M. Woeste, and each seemed to regard his position as absolutely unchangeable. The moderate and reasonable statesmanship which would have given good government to the country at the same time that it fairly represented the majority of the people was wholly lacking. But in recent years a movement has been started for a new party which would represent the real interests of the people and be neither ultra-Liberal nor ultra-Catholic. This party is represented by such men as M. Beernaert and M. De Smet de Naeyer, who came in power in 1899. The former had held a ministerial position for ten consecutive years in the course of which he had worked at the difficult task of revising the constitution. This revision was necessitated by the growth of the democratic spirit. For a period of sixty years—that is, down to 1833—Belgium was under a constitution which gave no electoral influence to the proletariat.

The Electoral System.—The constitution of 1833 admitted to the suffrage every Belgian citizen 25 years of age, but sought to avoid the dangers of universal suffrage by the principle of supplementary votes for citizens having an especial interest in the maintenance of public order. The law is complicated. It gives a vote to every male citizen resident for five years in the same commune and not legally disqualified; two votes to citizens 35 years of age with legitimate issue and paying a land tax of at least 5 francs a year, the double vote being accorded on the principle that the interest of a father of a family in political affairs was greater than that of a single man; two votes also to citizens 25 years of age with immovable property valued at 2000 francs, and three votes to citizens 25 years of age who can give proof that they have received the higher education. The Liberals suffered severely by the operation of this law, and Socialists had for the most part taken their place in the chamber, such of the Liberals as were elected having owed their success to a coalition with Socialists. On the other hand, the Clerical right has increased out of all proportion to the actual number of sympathizers among the people. At the beginning of 1899 the deputies included 112 Clericals, 28 Socialists, and 12 Radicals, although there was no such preponderance in the electorate. Divisions among the opponents of the Clericals, and especially among the Liberals, were the chief cause of this large Clerical majority. The inactivity of the Liberals has permitted the Socialists to make rapid progress, and their constituency is estimated at some 300,000, including, however, not only those who are strict disciples of Karl Marx, but the members of the workingman's party. The Socialists have won votes by their energetic campaigning and by the measures which they have proposed for immediate reform. Many Liberals, disgusted with the inertia of their own party, have gone over to the Socialists. The latter have shown much skill and diligence in making converts. They have held many meetings and organized public processions; they have carried on an aggressive campaign in the press and have established many co-operative associations and leagues.

Proportional Representation.—The introduction of proportional representation was a part of the government's plan, but it was opposed by the Conservative element. After the advent of the Socialists as a third party in Belgian politics the operation of the electoral law reduced the representative system to a farce. Under the system of majority rule the chamber was composed of three factions, no one of which could resist its two rivals when combined. The Clerical majority was thus entrenched in power only by the folly of its opponents. A combination of some sort, either of

Liberals and Catholics or of Socialists and Liberals, was inevitable, since scruples on the score of principle are as a rule insufficient to prevent these alliances for the purpose of immediate gain. Toward the close of 1898 there was a strong movement in favor of a coalition between Liberals and Socialists. Prominent Liberals organized a society under the name of Liberal Alliance in order to conciliate the progressives and the doctrinaires by a free discussion of the theories that divided them. In several quarters there was a willingness to sink minor differences in an agreement upon a general programme which should have for its main object the overthrow of the Clericals. This was the situation at the beginning of the year 1899; both Socialists and Liberals were showing a spirit of compromise. Proportional representation would give to each party a representation in the chamber in proportion to the strength which it had in the population at large, and the chamber, instead of being merely the expression of the majority, would truly represent the whole population. Its friends said that it promised to introduce a period of prosperity and moderate progress, such as the majority of the people desired to see. All parties being represented in the chamber according to their numerical importance, there would be no chance for such complete domination by the majority as had characterized the existing system. It would, moreover, strengthen the hands of the more moderate members of the chief parties and prevent the repeated fluctuations from one extreme to the other. It was urged that the moderate Catholics and moderate Liberals would no longer be at the mercy of their Radical leaders and that they would find interests in common, and finally unite in a new party which would better represent the popular sentiment. For these reasons the reform was opposed by many of the leaders. Neither the chief of the left, M. Friere Orban, or of the right, M. Woeste, could approve it. The latter was especially hostile to this policy on account of his long-standing rivalry with M. Beernaert. He could not accept a reform which would allow the moderate members of the Liberal party to re-enter the chamber. In 1893 he had driven his rival from power, having marshalled the majority in the chamber against the plan for proportional representation. After the overthrow of M. Beernaert, M. Woeste was the preponderant influence in the government, though himself not holding office. For five years he dictated the policy of the Catholic ministries, which constantly went to extremes and greatly offended the moderates. The desperate condition of the Liberals, who had not a single deputy in the chamber, drove them to seek an alliance with the Socialists and the Radicals. The Socialists, in spite of the wide differences between them and the Liberals, showed themselves most eager for this alliance, since it would increase their electoral strength and injure the Catholic party.

The Government Measure.—In the presence of this danger of a solidified anti-Clerical opposition, the government, at the personal instance of the king, it is said, devised an electoral reform measure of its own. The result of this was a ministerial crisis. M. De Smet de Naeyer, president of the council, and M. Nyssens, minister of labor, resigned on the ground that they would not associate themselves with an electoral reform based on the principle which the government proposed, and M. Vandepereboom became prime minister. From January to July, 1899, M. Vandepereboom was president of the council. It was his plan first to find a majority in the chambers and then to redistrict the country in such a way as to insure Catholic success. Combination was formed in favor of a *scrutin de liste* in the least important districts and the proportional system in the most important districts. By adopting proportional representation in the larger arrondissements, where the anti-Catholics were in the majority, the Catholics were sure of gaining a certain representation from the important cities. Thus they renounced the chance of a total representation from the large cities for the certainty of a partial representation. Such a reform would bring them an immediate advantage, since in several of the large cities, particularly in Brussels, the issue was doubtful for the approaching elections for 1900 in view of the probable alliance of the two opposing parties. On the other hand the maintenance of the existing system of majority vote in the smaller places where the Catholics had a majority assured them that they would retain their seat. Thus the Catholics could support the measure with complacency. At the same time the Liberals were appeased by the chance of obtaining seats in the chamber where they had none at the present time. The measure was opposed, however, by the more advanced Liberals and the Socialists, and by most impartial judges. The latter saw in it a peril to the proposed alliance between them and the Liberals and they fought against it in order that a continuance of discontent among the Liberals might drive them into an alliance with themselves. The project might have been voted had it not been for a portion of the Catholic party itself, and especially of M. Woeste, who saw in it a partial triumph of the ideas which his rival, M. Beernaert, represented. He called the project indefensible and rallied in opposition all the enemies of the government.

Ministerial Crisis.—There were disorderly scenes in the chamber on June 27 and

28, and when the excitement spread to the streets there seemed at one time to be danger of revolution. The agitation forced the ministry to make some concessions. On July 4, M. Vandenpeereboom announced that the government would consent to a reference of the project to a commission representative of all parties. This commission rejected the government bill, together with the other projects that were referred to it. This called for the resignation of the cabinet, since it had been defeated at every point. M. De Smet de Naeyer, who had been a member of the cabinet, but had separated from it on the question of electoral reform, was entrusted with the mission of forming a new cabinet, and on August 5 it was completed. It comprised the following members: M. De Smet de Naeyer, president of the council and minister of public works; M. De Trooz, minister of the interior; M. Van den Heuvel, minister of justice; M. Van den Bruggen, minister of agriculture; M. Liebaert, minister of industry, labor, and railways; M. De Favereau, minister of foreign affairs; General Cousebant d'Alkemade, minister of war. On August 9 the premier, having announced that he would adopt proportional representation as a basis of electoral reform, presented to the chamber a bill framed on the same general plan as had been favored by M. Theodor, the leader of the new political party known as the Independents, which represented a spirit of compromise and moderate progress. The irreconcilable Catholics represented by M. Woeste did not relax in their hostility and accused the ministry of De Smet de Naeyer of destroying the Catholic party. The Catholic party was in fact hopelessly divided. One portion of it continued to follow its old leader, M. Woeste, the other supported the compromise cabinet. The Socialists, however, who logically should have accepted the new ministry, presented a formidable opposition. This was due to the effect of the new law upon the proposed alliance between the Socialists and the Liberals. Now that proportional representation was granted, the moderate Liberals would have no motive for such an alliance. The Socialists, therefore, did all they could to oppose the measure, urging as a pretext that they could not accept proportional representation unless universal suffrage was granted at the same time. They aimed at the dissolution of the chambers in order that in the new parliament the majority of two-thirds required by the constitution for the establishment of universal suffrage might be found. In this plan they were not supported by the moderate Liberals or by the chiefs of the Radical party, who were inclined to accept the measure offered by the government. The object of this bill was to apply the principle of proportional representation to the whole country and place all electors on a footing of equality. The measure was accepted by the chamber on November 24, 1899, by a vote of 70 to 63, and it seemed likely to succeed in the senate. It was opposed by the irreconcilable Clericals and by certain Liberals and Socialists who were not satisfied with proportional representation unless it were accompanied with universal suffrage. Thus at the close of the year 1899 it seemed likely that parliamentary government in Belgium would proceed in a more moderate and reasonable manner. One political party had for years been striving for this result. This was what may be called the progressive Conservatives or Independents, who were opposed to the extreme views of the Liberals and the Catholics. Its leader was M. Theodor, whose intervention between the two extreme factions in the chamber had led to the restoration of peace and the establishment of the De Smet de Naeyer ministry. The Independents were still comparatively weak in numbers, but their influence seems to be on the increase. Hitherto they have been too insignificant numerically to impose their ideas upon the majority. Now, reinforced by the moderate members of the Liberals and Catholics, they form a nucleus of a new governmental party, a party that favors gradual and moderate progress. At the same time the Christian Democrats, who represent the spirit of Leo XIII. in the matter of social reform, have cast in their lot with the Independents. M. Alexandre Halot, on whose authority the foregoing account is mainly based, sums up the matter as follows: "The maintenance of Belgian independence seems to be at the expense of the natural development of the old political parties. This development, however, conforms to the aspirations of the great majority of the people, and for the moment it deprives collectivists and republicans of their preponderating influence. The disappearance of a paternal royalty which, without speaking of the exceptional merits of its two illustrious representatives, has by its very existence kept the country for seventy years under continual tutelage, was in danger of transforming it into a second Transvaal. The struggle may be narrowed down in future at least in respect to its main outlines to the collectivists and the non-collectivists. It is among the latter that this great party has its origin, a party which faithfully represents the average opinion of the country, and not the extreme opinions of factions, and which admits the healthy parliamentary traditions of the united kingdom, at the same time so free, so religious, and so prudently and constantly progressive."

BELIZE. See BRITISH HONDURAS.

BELLEROSE, J. H., a senator in the Dominion Parliament, died at St. Vincent de Paul, Quebec, August 13, 1899. He was born at Three Rivers, Quebec, July 12, 1820. In 1873 he became a senator, representing the Conservative party.

BELOOCHISTAN or BALUCHISTAN. See **BALUCHISTAN**.

BERESFORD, REAR-ADMIRAL LORD CHARLES WILLIAM DE LA POER, the second son of the Rev. John Beresford, fourth Marquis of Waterford, born in Philiptown, County Dublin, Ireland, February 10, 1846, has had an honorable career both as naval officer and statesman. His name is now particularly associated with the partition of China. In 1898 he was sent to China by the Associated Chambers of Commerce of Great Britain on a special mission, and on his return to England in 1899, by way of the United States, he created great interest in the question of "an open door to China." He delivered many speeches in this country, declaring that England, the United States, Germany, Japan, and Italy have common interests in the division of China. (See **CHINA**.) His policy is, of course, anti-Russian. His book, *The Break-up of China*, was published in 1899. He entered the royal navy in 1859, and became sub-lieutenant in 1866, lieutenant in 1868, commander in 1875, captain in 1882, and rear-admiral in 1897. In 1875-76 he accompanied the Prince of Wales as naval aide-de-camp to India. In 1886 he was made a lord-commissioner of the admiralty, but resigned in 1888 on the question of strength of fleet. He has received three medals for having saved lives at sea on three different occasions, and various other medals for bravery, notably for the "Condor" bombardment, Alexandria, 1882. In 1884 he was appointed on the staff of Lord Wolseley for the Nile expedition, and was in command of the naval brigade with Sir Herbert Stewart across the desert. In 1885 he rescued Sir Charles Wilson's party, wrecked on their return from Khartoum. While commanding the cruiser *Undaunted* in the Mediterranean, he saved the French cruiser *Seignelay* from shipwreck, and received the thanks of the French government. In 1893-96 he was in command of the steam-reserve at Chatham. Lord Charles Beresford sat in the House of Commons for the county of Waterford (Conservative) from 1874 till 1880, and effected several naval reforms. He represented Marylebone from 1885 till 1889. In 1897 he was appointed naval aide-de-camp to Queen Victoria, and took part in the Jubilee procession. In 1898 he was elected for York. He left England for the East August 24, 1898, and returned in the latter part of 1899. His principle is that "no commercial development of China is possible until China can guarantee security to trade and commerce by adequate and efficient military and police protection." Lord Charles Beresford is the author of *Nelson and His Times*, and many essays on Egypt, China, and naval subjects. In the latter part of 1899 he was appointed to be second in command of the Mediterranean fleet.

BERMUDA, or Sommer's Islands, a group of some 360 small isles and islets lying in the Atlantic Ocean in 32° 15' north latitude and 64° 51' west longitude, is a colony of Great Britain, having an area of about 20 square miles, and a population in 1897 of 16,098, of which 6184 were whites. Only some 20 of the islands are inhabited, most of the rest being little more than projecting rocks. The chief town and seat of government is Hamilton (pop., 1296), on Long Island. The nearest mainland is the North Carolina coast, Cape Hatteras being some 580 miles distant. The distance from New York is 677 miles. The government of the colony is administered by a governor, who is also commander-in-chief of the British military forces stationed there. He is advised by an executive council of 6 members, appointed by the crown. In addition there is a legislative council of 9 members, also appointed by the crown, and a house of assembly of 36 members, 4 members being elected from each of the nine parishes. The governor since 1896 has been Lieutenant-General George Digby Barker, C.B. Bermuda is an important naval base; the average number of British troops there is reported at 3178. Of the 57 schools, 24 receive government aid amounting each year to £1224. The number of pupils is upward of 1400. The chief source of revenue is customs duties, and the leading items of expenditure are salaries and appropriations for public works, churches, and schools. The revenue and expenditure for 1897 were £35,965 and £35,704, respectively; for 1898, revenue £38,923, expenditure £39,102. At the end of the latter year the public debt was £45,600. The principal crops are onions and potatoes; other products are lily bulbs, melons, pumpkins, and arrowroot. The trade, which is chiefly with the United States and Canada, amounted in 1897 to £127,703 for exports, and £323,148 for imports. On July 24, 1899, an agreement was made with the United States, effecting the reduction of import duties on certain American products, and a 20-per-cent. reduction of the duty on Bermudian vegetables at American ports. There are 51 miles of telegraph wire, 15 of which are submarine. Since 1890 there has been telegraphic communication with Halifax, N. S. The salubrity of the climate and the agreeable temperature have made the islands a favorite winter resort for Ameri-

cans and Canadians. On September 12, 1899, a hurricane did great damage to property in the islands. See ZOOLOGICAL STATIONS.

BERRY, Rev. CHARLES ALBERT, D.D., English Congregational clergyman, died at Bilston, Staffordshire, January 31, 1899. He was born at Leigh, Lancashire, December 14, 1852; was educated in a private school at Southport and at Airedale Independent College, Yorkshire. He held a pastorate at Bolton from 1875 to 1883, and at Wolverhampton from the latter year to the time of his death. He received many calls to other charges, including one to succeed Henry Ward Beecher in Plymouth Church, Brooklyn, but he declined them all. Dr. Berry travelled widely: he visited the United States in 1880, 1887, 1891, and 1897; made a tour through Egypt, Palestine, and other parts of the Levant in 1886; and in 1891-92 travelled around the world, visiting Australia and New Zealand. In 1895 he received the degree of Doctor of Divinity from St. Andrews University. He was ex-president of the National Council of Evangelical Free Churches, and in 1897 was chairman of the Congregational Union of England and Wales. In this year he represented the Arbitration Society in America, and advocated the reconsideration by Congress of the Anglo-American treaty. To this end he made addresses in many of the principal American cities. Besides various papers and a volume of sermons he published *Vision and Duty*, 1892, and *Mischievous Goodness*, 1897.

BEVERIDGE, ALBERT J., United States senator from Indiana, was elected as a Republican to succeed Senator David Turpie, Democrat, January 17, 1899. At the time of his election Mr. Beveridge was 36 years old, and is thus the youngest man in the Senate except Senator Butler, of North Carolina, who is his junior by a few months. Mr. Beveridge, who, before this election, had never been chosen to public office, has won prominence at the Indianapolis bar, and is known not only as an able lawyer, but as an orator of considerable power. He began life on an Ohio farm, and worked his way through De Pauw University, graduating in 1885, in which year also he took first honors in the State and interstate collegiate oratorical contests. His health gave way after graduation, and for a time he followed an out-of-door life on a ranch in the far West. After his election to the Senate in 1899, Mr. Beveridge went to the Philippine Islands for the purpose of making a personal investigation of the question most prominent in American politics during the year. The result of these observations was his agreement with the report of President Schurman, Admiral Dewey, and the other members of the Philippine Commission, endorsing the administration's policy of putting down the insurrection and retaining the islands. Mr. Beveridge's term of office will expire March 3, 1905.

BIBLE SOCIETY, AMERICAN, founded in 1816 for the gratuitous distribution of Bibles among the destitute, reports for 1899 receipts amounting to \$352,217. It issued 1,380,822 copies of various publications, more than half of which were distributed in foreign lands. The society publishes the *Bible Society Record*. President, Enoch L. Fancher, LL.D. (deceased); secretary, Rev. William I. Haven, D.D., Bible House, New York City.

BICYCLING. See CYCLING.

BILLIARDS. The Amateur Athletic Union's efforts to control amateur billiards were prosecuted vigorously during 1899, but two factions rebelled against the union's restrictions, and formed separate organizations, in New York and Chicago. On October 27 the National Association of Amateur Billiard Players was organized at New York, with Orville Oddie, Jr., as president, and Charles W. Minor as secretary. The A. A. U., however, held its usual championship meetings to correspond with those for the preceding season, and debarred those who played in unregistered tournaments. Three new billiard records were made at the 1899 championships—namely, for the highest amateur (class A) run, the highest amateur (class A) average, and highest amateur (class B) average. These will be noted in the account of plays which follows. The A. A. U. championships were held at New York. The class B tournament, December 4-19, 1898, was won by J. Byron Stark. New York, 6 won games out of 6 played; highest run, 47; best average, 10.34; grand average, 7.72, his best average being a new (class B) record. The class A tournament, February 14-19, 1899, was won by Martin Mullen, Cleveland, 3 won games out of 4 played; best run, 73; grand average, 8.29; second place, W. P. Foss, Haverstraw, N. Y., 2 won games out of 4; best run, 133; grand average, 8.26; third, W. C. McCreery, New York, best run, 139 (new record); grand average, 9.16; besides making the highest amateur run on record, McCreery also made a new amateur record, 13.33, for a single-average. The class A games were 400 points each, 14-inch balk-line, 10 shots allowed in the anchor spaces; the class B games were 300 points, 14-inch balk-line, with the "anchor-nurse" allowed. Two important professional matches in billiards were played in 1899, between George F. Slosson and Jacob Schaefer, at New York City, in the fall and spring, respectively. The first was a two-game match, May 15 and 22; first game (18-inch balk-line) won by Schaefer—

total, 600; average, 13 28-44; high run, 139; Slosson—total, 418; average, 9 31-43; high run, 62; second game (cushion carroms) won by Slosson—total, 400; average, 4 52-87; high run, 34; Schaefer—total, 359; average, 4 15-86; high run, 55. The second match was at cushion carroms, and was held on October 30 and two succeeding nights; the final results were as follows, Slosson being the winner: Grand totals—Slosson, 900; Schaefer, 757; grand averages—Slosson, 4.56; Schaefer, 3.84; biggest runs—Slosson, 37; Schaefer, 41. Frank C. Ives, generally considered as the best billiard player in the world, died at El Progreso, Mexico, on August 30. On April 2, 1898, at Chicago, he defeated Schaefer in a balk-line game for the world's championship by 600 to 427. At the time of his death he held these records for 1899: Highest run for tournament play, 85 points, made at Boston, 1896; highest run (with "anchor-nurse" barred), 359 points, Chicago, 1894; highest average, with "anchor-nurse" allowed (held also by Schaefer), 100, Chicago, 1894; same, with "anchor-nurse" barred, 63 2-10, New York, 1894; the above are all in cushion carrom games. Eighteen-inch balk-line, highest run for tournament play, 290 points (5 shots allowed in the anchor spaces), New York, 1896; with "anchor-nurse" barred, 140 points, New York, 1897; highest average for tournament play, 50 (5 shots allowed in the anchor spaces). New York, 1896.

BILLOT, JEAN BAPTISTE, French general and senator, who was conspicuous in the Dreyfus case, was born at Chaumeil, August 15, 1828, admitted to the École de St. Cyr in 1847, and appointed to the staff in 1849. In 1870 he became colonel, and after the Franco-German War, in which he made his mark, he was elected to the national assembly. He sat among the Republicans of the Left, and opposed the attempts to restore the monarchy in 1873. In 1875 he was elected senator, and in 1878 was instrumental in passing a bill for reorganizing the staff of the French army. In 1882 he became minister of war in the Freycinet Cabinet, but resigned in 1883 because he would not deprive the Orleans princes of their military rank. In 1859 he was made Chevalier of the Legion of Honor, and in 1889 was given the Grand Cross. In 1897 he was concerned in the Dreyfus case, and was afterward prominent for his efforts to divert suspicion from the French army. He retired in June, 1898, but he appeared as a witness in the Dreyfus trial of 1899. See FRANCE (paragraphs on History).

BIOLOGICAL STATIONS. See ZOOLOGICAL STATIONS.

BIOLOGY. During the year 1889 the investigations of biological questions have gone on along quite different lines from those of the preceding year. There has been no important contribution to the discussion of vitalism, which was such a notable topic in 1898, and the question of heredity has received its most valuable treatment this year from the practical zoologists and botanists, rather than from those who deal more especially with the theoretical side of the problem. Dr. Pearson has, however, continued his important papers under the title of *Mathematical Contributions to the Theory of Evolution*, three parts having been published, as follows: I. *Theoretical*. II. *On the Inheritance of Fertility in Man*. III. *On the Inheritance of Fecundity in Thoroughbred Race Horses*. The evidence presented in these papers seems to show that fertility is inherited in man and fecundity in the horse, and "therefore probably that both these characters are inherited in all types of life."

An interesting paper, illustrating the biological phenomenon known as *convergence*, has been published by Dr. C. H. Eigenmann in continuation of his work on the blind fishes of caves. He has shown by comparative study of the blind fishes of the caves of Missouri and Kentucky that they represent quite different species, which have become superficially very similar because of similarity in their habits and environment. A still more important paper, throwing light on quite a different phenomenon, is that by Dr. Alexander Graham Bell, *On the Development by Selection of Supernumerary Mammary in Sheep*, presented to the National Academy of Sciences in April. In this paper, Professor Bell gives an account of experiments made on his Nova Scotian farm to "ascertain whether by selective breeding supernumerary mammary could be developed from a rudimentary condition into real functional nipples yielding milk, and whether in this case the fertility of the ewes would be increased." The result of these experiments shows conclusively that the supernumerary mammary could be developed by selective breeding into functional nipples. More than this, Dr. Bell shows that he has actually established a breed of sheep in which females with two nipples are entirely wanting, those with *three* are rare, the great majority have *four* or *five*, while twenty per cent. have *six*. Whether this has resulted in increased fertility in the ewes is not stated.

The other important work of the year bearing on the subject of general biology may be grouped under two heads, Regeneration and Hybridization.

Regeneration.—Under this head two papers of more than usual importance have been published. One of these appeared in the *Bulletin of the Johns Hopkins Hospital*, and gives an account of some experiments made by Dr. R. G. Harrison with

tadpoles to determine the nature and extent of their powers of regeneration. The experiments were made with the tadpoles of two species of frogs, and owing to their different color markings it was possible to trace very exactly the results of each experiment. The possibility of grafting the tail of one individual on to the head of another, even where the two are of different species, was shown, and the results of these and other sorts of graftings were carefully noted. The other paper on regeneration deals with the question from the theoretical point of view, and is from the pen of the well-known German zoologist, Weismann. It was first published in the *Anatomischer Anzeiger* and *Natural Science*, and was later issued in pamphlet form. He first expounds the proposition that "the regenerative power of a part is to be considered not as a direct and necessary expression of the nature of the organism, but rather as a capability, which, though it may be absent, is found wherever it is necessary in the interests of species preservation." He then examines the objections to this view and shows why he regards the facts which are as yet known as really supporting rather than serving to overthrow his view. The second part of the essay is an attempt to show that regeneration phenomena are interpretable on "the ontogenetic theory of determinants, reserve germ-plasm, etc." This second part is entirely independent of the first and is of much less general interest, though of great importance to those interested in theories of heredity.

Hybridization.—Under this topic we have to deal with two very different subjects, but each of which is important. The first is the "International Conference on Hybridization," which was held at Chiswick, in England, under the auspices of the Royal Horticultural Society. The second is the account which Professor J. C. Ewart has published of his experiments in search of evidence in support of the famous theory of teleonomy. The former dealt with the subject of hybrids almost wholly from the botanical point of view, but the results of such a conference are of great interest to every biologist. Only two days were given to the conference, July 11 and 12, but a dozen papers were read and others will appear in the published report. Besides England, five countries were represented—France, Germany, Holland, Switzerland, and the United States. The topics which were discussed included such fundamental ones as the conception of species, the limits of hybridization, prepotency, the character of hybrids, etc. A number of important topics, however, were scarcely touched on, because of the limited time, and it was suggested and hoped that another conference might be held in the near future.

Professor Ewart's accounts of the experiments which he has been making in the crossing of the zebra and the horse are beyond question the most important papers bearing on biological problems which have appeared during 1899. These are already well known as the "Penycuik Experiments," and are the most thorough and satisfactory which have ever been made in testing the results of cross-breeding among mammals. The experiments are still in progress, but are now so far along that Professor Ewart felt justified in publishing some of his results. They first appeared in book form under the title *The Penycuik Experiments*, and a little later a paper was presented to the Royal Society on *Experimental Contributions to the Theory of Heredity. A. Teleonomy*. It is impossible in the brief space at our disposal here to give anything like an adequate account of these experiments or their results. They were undertaken to determine whether a sire can in any way affect the offspring of subsequent sires in any given female—that is, if a mare is covered by a zebra stallion and bears a hybrid foal, and then is covered by a stallion of her own breed, will her foal show any signs of the previous intercourse with the zebra. Professor Ewart crossed an Island of Rum mare with a zebra stallion, and, as might be expected, the foal was decidedly zebra-like. She was then crossed with a gray Arab stallion and in subsequent years with stallions of other breeds. As a result of these and a number of similar experiments, Professor Ewart finds no evidence in support of the theory of teleonomy—that is, the influence of the zebra sire affects only his own descendants. He does find, however, that the crossing of distinct species leads to reversion, thus giving support to one of Darwin's theories. He concludes from studying his hybrids that the Somali zebra is in its color pattern the most ancestral form of the modern equidæ. One other important result of these experiments was to show that these zebra mules are not immune to the poison of the tsetse fly. It was hoped that they might prove to be, but the three which were inoculated with the poison, though more resistant than horses, died in about eight weeks. See ZOOLOGICAL LITERATURE (paragraph General Treatises).

BIRD PROTECTION. See ORNITHOLOGY (paragraph Organizations).

BISMARCK ARCHIPELAGO comprises several groups of islands in the Pacific Ocean, to the north of the eastern portion of New Guinea. They include the New Britain Archipelago and several adjacent groups, and have formed a German protectorate since 1884. The chief islands are Neu Pommern, Neu Mecklenburg, Neu Lauenburg, Neu Hannover, Admiralty, Anchorite, Commerson, Hermit, and others,

with an area of about 20,000 square miles and a population estimated at 188,000. The chief exports are cocoanut fibre and copra. Cotton raising is an important industry. The German New Guinea Company, which controls most of the commerce, has a trading station at Matupi.

BLAIKIE, WILLIAM GARDEN, D.D., LL.D., educator and author, was born at Aberdeen, Scotland, February 5, 1820; died at North Berwick, June 11, 1899. He was the son of James Blaikie, Lord Provost of Aberdeen, and was educated at that university and at the University of Edinburgh. He was ordained minister of Drumblade in 1842, and the next year he joined the Free Church of Scotland. From 1868 to 1897 he was professor of theology, Free Church, Edinburgh. Dr. Blaikie was one of the principal promoters of the Pan-Presbyterian Alliance, of which he was president from 1888 to 1892, presiding in the latter year at the meetings in Toronto, Ontario. In this year also he was chosen moderator of the general assembly of the Free Church. He was editor of the *Free Church Magazine*, 1849-53; of the *North British Review*, 1860-63; of the *Sunday Magazine*, 1870-74, and of the *Catholic Presbyterian*, 1879-83. Among his many works are: *Bible History*, 1859; *Bible Geography*, 1861; *Better Days for Working People*, 1863; *Heads and Hands in the World of Labor*, 1865; *For the Work of the Ministry*, 1875; *Inner Life of Our Lord*, 1876; *Personal Life of David Livingstone*, 1880; *Public Ministry of Our Lord*, 1883; *Leaders in Modern Philanthropy*, 1883; *Preachers of Scotland*, 1888; *Expositor's Bible*, 1888-93; *Summer Suns*, 1890; *After Fifty Years*, 1893; *Heroes of Israel*, 1894; *Life of Chalmers*, 1897; *Memoir of Principal David Brown*, 1898.

BLAIR, General CHARLES W., died at Kansas City, Mo., August 21, 1899, at the age of seventy years. He was born in Georgetown, O.; he entered politics and rose to a prominent place in the Democratic party of that State. At one time he was candidate for the lieutenant-governorship, and failed of election by only a small number of votes. He helped organize the Second Kansas regiment in the Civil War, organized the Blair Battery, and became colonel of the Seventh Cavalry. President Lincoln recommended his promotion to the rank of brevet brigadier-general, and he received his commission from President Johnson. At the time of his death he was attorney for the Kansas City, Fort Scott and Memphis Railroad.

BLAIR, JOHN INSLEY, the prominent financier, died at Blairstown, N. J., December 2, 1899, at the age of ninety-seven years. He was possessor of a vast fortune and well known for his philanthropy. His active business connections were broken off only four years before his death. He made his start as a shopkeeper, but in 1839 "Blair, of Blairstown," as he became known among financiers, associated himself with the Scrantons, who also gave their name to a town, in developing the iron business, and these men, with others, bought and constructed a little road from Owego to Ithaca. In this way he began his career as a builder of railroads. In the following years he built with his own and his associates' capital, in part, nearly thirty railroads, greatly developing the West. The more important lines in which he was most actively interested were the Delaware, Lackawanna and Western, Chicago and Northwestern, Chicago and Pacific, New York, Susquehanna and Western, and the Union Pacific railroads. Before the consolidation era it is said that he owned more miles of railroad than any other individual, being president or large stockholder in twenty roads. But his enterprises were not confined to railroads. From the enormous land-grants received in the West he laid out sites for what are now more than one hundred flourishing cities and towns. His iron interests, also, begun with the Scrantons, expanded into several large manufactures, and he had extensive mining interests. As a philanthropist, one of his last gifts was Blair Hall, at Princeton. Besides large gifts of money to that university, he endowed a professorship there. He gave Lafayette College nearly \$90,000 and rebuilt Grinnell College, Iowa. The Presbyterian Academy at Blairstown was founded by him and endowed to the amount of \$600,000. His religious and charitable donations were large. Besides building the Methodist church at Blairstown, he caused the erection, it is said, of over one hundred churches throughout the country west of the Great Lakes.

BLANCO, ANTONIO GUZMAN. See GUZMAN-BLANCO, ANTONIO.

BLAND, RICHARD PARKS, Democratic member of Congress from Missouri, whose death occurred at his home, near Lebanon, in that State, June 15, 1899, was for many years one of the foremost advocates of the free coinage of silver by the United States government. He was born near Hartford, Ky., August 19, 1835. In his youth he worked on a farm in the summer months to provide means for attendance at school in the winter. At the age of eighteen he attended the Hartford Academy for a year, and then after teaching school for a few terms started for California in 1855. On the way he stopped in Wayne County, Mo., and taught school for a term. During the next ten years he turned to various occupations in California, Nevada, and Colorado. He studied and practised law, being admitted to the bar in 1860. At one

time he was treasurer of Carson County, Col., which at that time was a part of Utah. Returning to Missouri in 1865, he practised law in Rolla, and four years later removed to Lebanon. In 1872 Bland was elected to the Forty-third Congress, as a Democrat, from what was then the fifth district of Missouri. In this Congress he opposed the act demonetizing silver, which he and others subsequently termed "the crime of '73;" he also opposed the system of national banks, and supported the bill, vetoed by President Grant, for the increase of the greenback circulation from \$375,000,000 to \$400,000,000. Elected to the next Congress, he was appointed chairman of the committee on mines and mining, and from that committee reported the first bill introduced in Congress for the free coinage of silver since its demonetization. The House had a Democratic majority for the first time since Buchanan's administration, and in its second session passed the bill. The measure, however, failed of consideration in the Senate. This Congress authorized the Silver Commission, of which Bland was a member, and after an exhaustive examination of the subject he submitted to the next Congress (the Forty-fifth), to which he had been returned, his elaborate "Silver Commission Report." Bland then introduced his famous bill for the free and unlimited coinage of silver, which was passed in the House by more than a two-thirds vote. The Senate adopted the amendment made by Mr. Allison, striking out the feature of unlimited coinage and substituting a provision for the purchase and coinage each month of not less than \$2,000,000 or more than \$4,000,000 worth of silver bullion. The supporters of the bill in the House concluded that they could not do better than accept the amendment, but the bill, even though amended, was vetoed by President Hayes, and then was passed over the veto on February 28, 1878. This "Bland-Allison law" was repealed by the passage of the Sherman bill in 1890, but it was not before 380,000,000 standard dollars had been coined under its operation.

As a member of the Forty-sixth, Forty-seventh, and Forty-eighth Congresses, Bland was prominent as an advocate of tariff reform and as an opponent of the rechartering of national banks. In the last-named Congress and in the Forty-ninth he served as chairman of the committee on coinage, weights, and measures. He again reported a bill for the free coinage of silver, and though this failed of passage, Bland succeeded in defeating the proposed suspension of the law of 1878. In the Fiftieth and Fifty-first Congresses he was active in opposing the Republican policy of the protective tariff, first in 1888 by his support of the Mills bill, which failed in the Senate, and secondly by his opposition to the McKinley bill of 1890. In the latter year the Bland-Allison law was repealed by the passage of the Sherman act. This act Bland made strenuous but unsuccessful efforts to amend with a free-silver clause. The year 1894 was notable for general Republican success, and Bland was not returned to the Fifty-fourth Congress; he was re-elected, however, to the Fifty-fifth, and in November, 1898, to the Fifty-sixth. At the Democratic national convention at Chicago in 1896 Bland received on the third ballot 291 votes for the presidential nomination, but after the fourth ballot his name was withdrawn. He was a member of Congress from 1873 to 1895 and from 1897 to the time of his death. In the House of Representatives he was a man of large influence. It has been said, indeed, that "probably no Democrat in Congress had a more influential share in fastening on the party the political tendencies and policies which now [the time of his death] form its accepted creed."

BLOMFIELD. Sir ARTHUR WILLIAM, M.A., A.R.A., died October 30, 1899. Sir Arthur was a well-known architect. He was born March 6, 1829, and was a son of the late Rt. Rev. Bishop of London. He was prepared for the university at Rugby and was graduated from Trinity College, Cambridge. At Cambridge he was a member of the crews. Sir Arthur was appointed architect to the Bank of England, 1883. His title was created in 1889.

BOCKUM-DOLFFS, FLORENS. HEINRICH VON, German statesman, died at Soest, Westphalia, February 8, 1899. He was born at Soest, February 19, 1802; studied law and political science in Heidelberg and Berlin, and became in 1837 magistrate of his native district. In 1847 he became a member of the *Landtag*, and from 1849 to 1851 was in the first chamber; at this time he was a zealous representative of liberal political views. He was elected in 1852 to the assembly (*Abgeordnetenhaus*), in which he remained continuously until 1885. Here, despite a lack of oratorical skill, he came to have much influence, and in 1861 was one of the leaders of a new party, which later was known as the Left Centre, and had a place between the extreme and the moderate Liberals. In 1863 he was made president of the house. From 1867 to 1870 he was a Liberal member of the North German and from 1871 to 1884 of the German *Reichstag*.

BOERS. See TRANSVAAL.

BOHEMIA, a province of Austria-Hungary, with an area of 20,060 square miles and a population of 5,843,094 on December 31, 1890, and of 5,942,728 on December 31, 1893. About two-thirds of the population are Czechs and one-third Germans. In the central government Bohemia is represented by 110 members in the *Reichsrath*. The local government consists of a provincial diet of one assembly, with a membership of 242. It is summoned annually and its deputies are elected for six years. For higher education it has a German university and a Czech university at Prague. German and Czech technical high schools and an art academy at Prague, a school of mines at Příbram, and four theological seminaries. In 1897-98 the German university at Prague had 1321 students and the Czech 2831 students. In the same year the gymnasia and real-gymnasia numbered 56; the *real* schools, 25, and the intermediate schools, 81. There are also normal schools and commercial and industrial schools. The country is rich in natural resources. The forests, though they have supplied fuel for many centuries, are still extensive, owing to the wise care of the government in providing for the planting of trees in place for all that are cut down. The agricultural land covers an area of 2,625,376 hectares, of which 1,618,995 were planted with grain in 1897. Among the chief crops are wheat, rye, oats, barley, potatoes, beet-root, flax, and hay. Game is abundant, and includes deer, hares, rabbits, partridges, grouse, and pheasants. Coal is the chief mineral product, but graphite, gold, silver, lead, tin, antimony, and iron are also found. Among the chief industries are brewing and sugar refining. Match factories, tobacco works, distilleries, and furniture factories are also numerous. Bohemia carries on a considerable trade with the United States. The figures for the whole country during 1899 were not available, but from the United States Consular Reports of August, 1899, it appears that the recent decline in Bohemian trade has come to an end, and that trade conditions as a whole show an improvement, although there was a falling off in the exports for the first quarter of 1899 as compared with the first quarter of the previous year. A large number of electric-car lines have been projected, and there is an active demand for electrical supplies. Wages are low, especially in the linen industry and in branches of the glass industry. Labor organization has recently made considerable progress in Bohemia and has supported strikes for higher wages. In 1899 a strike occurred at Nechod among the linen weavers, and gave rise to a riot, in the course of which several shops were plundered. It was suppressed by calling on the militia. Bohemia is the most productive state in Austria, but the existence of the bitter strife between the Czechs and the Germans has interfered with trade in the last few years.

Political Situation.—For many years Bohemia has been striving for the same measure of local independence which was granted to Hungary in 1867. Latterly the antagonism between the German and Czech races has grown more acute, especially since the formation of the Young Czech party, with its intense national spirit. The bitter quarrel over the language question, which marked the years 1896 and 1897, continued during 1899. The demand of the Czechs that the Bohemian tongue should be placed on the same footing as the German was at last met by the Badeni ordinances, passed in April, 1897; but the opposition of the Germans led to the overthrow of the Badeni cabinet, and on February 24, 1898, the new cabinet substituted for the Badeni ordinances an arrangement which was more favorable to the German language, although it was by no means satisfactory to the German element in the population. The Bohemians desired a system of federalism—that is, an increase of the legislative powers of each of the seventeen provinces. The policy of the nationalists seemed to be to exclude the Germans as far as possible from the administration. A method of compromise which appealed to some statesmen was to grant each nationality its own national territory, but this met with much resistance. In parts of the empire it was impossible to make administrative divisions conform to the nationalities. Where one nationality was in the majority it was difficult to check its tendency toward expansion. As to the language, the matter is complicated by the fact that even between Slavic races which speak different dialects the German language is used as an intermediary. The central authorities also use the same tongue in their communications with one another. It is impossible for parliament to carry on a discussion in eight languages and even more absurd that an army composed of soldiers speaking different languages should not have a single tongue adopted for commands. The federalists would have an army of national defence for each province, and the commands should be given in the national tongue. The imperial army would not be a unit, and there would not be unity in the civil administration. This was the objection made to the federalist programme. The Germans charged the Slavs with desiring the destruction of the empire. They did not wish to see the German minority absorbed by the Slav majorities. They favored a policy which would suppress so far as possible the spirit of nationality and would redistrict the empire in violation of national lines. This met with bitter opposition from the Slavs. On their side they feared opposition from the German

minority, and were opposed to a limitation of their national expansion. This was especially true of Bohemia and of Moravia and Silesia, which once belonged to the kingdom of Bohemia. The Germans claimed that justice and the practical needs of the country and local conditions required a division of the Bohemian territory into national districts. They held that where the German language was spoken by the majority it should become the official language.

On the other hand, the Bohemians were working for a settlement of the matter on a basis that seemed to threaten the unity of the empire. They opposed the making of German the intermediate language for the different races of Austria and the requirement that all state officials should give proof that they knew German. They regarded such measures as a menace to the national spirit of Bohemia. The German party were willing to allow each province where more than one language was spoken to settle the language question according to the wishes of the majority. Their chief purpose seemed to be to take the regulation of the language matter out of the hands of the executive and give it over to the *Reichsrath*, which should promulgate a new law, while the federalists wished the question to be left to the diets of the different provinces. See AUSTRIA-HUNGARY.

BOKHARA, a state of central Asia, which since 1868 has been a vassal of Russia. It lies to the south of Russian Turkistan and to the north of Afghanistan. It is under an Ameer (Sayid Abdul Ahad in 1899). It has an area of about 92,000 square miles and a population of about 2,500,000. Bokhara is the capital, with about 100,000 inhabitants. The dominant race is the Uzbeg, but the aboriginal inhabitants are Tajiks. The people are Mohammedans of the Sunni sect. The chief products are corn, fruits, cotton, silk, wine, tobacco, and hemp. The live stock includes sheep, horses, goats, and camels. Among the mineral products are gold, salt, alum, sulphur, and coal. There is an extensive trade, which is valued at 32,000,000 roubles annually. The latest figures show that the trade is chiefly with Russia, Persia, Afghanistan, and India, but Russia and Persia take up by far the largest part. Among the chief exports are raw silk and cotton, and among the imports are green tea, indigo, muslins, drugs, shawls, etc. Russian steamers ply along the Oxus or Amu-Darya, which forms its southern boundary, and the Russian Trans-Caucasian Railway traverses the country, passing within a few miles of the capital. A telegraph line connects Bokhara and Samarkand. The Russian government permits the Ameer to maintain a native army for administrative purposes, numbering about 20,000. Military instruction is given by Russian officers. There is a Russian political resident at the court.

BOLIVIA, one of the two interior republics of South America, is bounded on the north and east by Brazil, on the south by Paraguay and Argentina, and on the west by Chile and Peru. The capital is Sucre.

Area and Population.—The country consists of nine departments, the total area of which is 597,340 square miles. This includes the Littoral department of 29,910 square miles, containing the ports of Antofagasta and Arica, which was mortgaged to Chile after the war of 1879-80, and has never been redeemed. The total area of the existing departments, then, is placed at 567,430 square miles. The last official estimate placed the population, exclusive of the inhabitants of the Littoral department, at 2,019,549; there are said to be about 1,000,000 Indians, 500,000 whites, and 500,000 Mestizos. The department of largest area and largest population is La Paz de Ayacucho (area, 171,130; population, 593,779). Beni is the least populous department (area, 100,580; population, 26,750), and Cochabamba the most populous (area, 21,430; population, 360,220). Oruro is the smallest (area, 21,350). The estimated populations of the principal towns are: La Paz, 40,000; Cochabamba, 25,000; Sucre, 20,000; Potosi, 20,000; Oruro, 15,000; Santa Cruz, 10,000; Tarija, 10,000.

Government.—By the constitution, which dates from October, 1880, the chief executive authority is vested in a president, who is elected by popular vote for a term of four years, and is assisted by a cabinet, comprising the portfolios of foreign affairs and worship, government and colonization, finance and industry, justice and public instruction, and war. The president is not eligible to election for the ensuing term. For the term beginning August 15, 1896, the president was Señor Servero Fernandez Alonso, but as a result of the revolution, described below, General José Manuel Pando was elected president on October 26, 1899. Señor Lucio P. Valesco became first vice-president.

The legislative power devolves upon a congress of two houses, the senate and the chamber of deputies; the members of the former are 18 in number, and are elected for six years; and of the latter, 64 in number, and elected for four years. Legal voters must be able to read and write. The departments, which are administered by prefects, comprise 52 provinces and 374 cantons, administered, respectively, by sub-prefects and magistrates (*corregidores*). The capital of each province has

a municipal council. Besides local justices (*alcaldes*) throughout the country, there are eight district courts and the supreme court.

Army.—Besides the standing army of 2000 men, there is a national guard of about 80,000. Militia service is incumbent upon citizens between 21 and 50 years of age. The cost of the army for 1897 was estimated at 1,748,697 bolivianos. There is a military school, having 9 professors and about 60 cadets.

Finance.—The principal sources of revenue are customs, silver and other minerals, liquor taxes, and stamps; the chief items of expenditure are instruction and public works, war, and finance. The revenue and expenditure in bolivianos for 1896 have been reported at 3,566,777 and 4,264,681, respectively; the revenue for 1897 was 4,840,300 bolivianos; for 1898 the estimated revenue was 5,194,593 and the estimated expenditure 5,714,793. The annual provincial revenue, used for provincial administration and local improvements, is about 600,000 bolivianos. At the close of the fiscal year 1897 the external debt, due to Chilean creditors, was 1,084,555 bolivianos; to the payment of this 40 per cent. of the customs collected at Arica, the privileges of which port are still allowed Bolivia, are applied. In 1898 the internal debt was 3,707,541 bolivianos. There are two banks of issue in the country and three mortgage banks. The value of the bolíviano in United States currency on October 1, 1899, was \$0.436.

Industries and Commerce.—Though large areas of Bolivia are suitable for cultivation, agriculture is in an unprogressive state; manufactures of any considerable importance are almost unknown. Accurate data of the production and commerce of the country as a whole cannot be obtained, since there is no official statistical bureau. The important products include rubber, cocoa, cinchona, and coffee. The production of cereals, beans, and potatoes is sufficient only for domestic consumption, although the country is well adapted for their cultivation. Sugar-cane grows readily, but it is cultivated only to a small extent, and the product is used for distillation. Sugar is imported from Peru. Cattle, llamas, and sheep are numerous. Bolivia is rich in forests and grazing lands, but thus far their development has been very limited. Transportation is exceedingly difficult, and in addition to this the people themselves seem to have no high degree of competency. The mineral wealth is large, and includes silver, copper, tin, zinc, lead, gold, antimony, bismuth, and borax. The most important metal mined is silver, the production of which fell off in 1895 and 1896, but in 1897 was said to amount to 15,000,000 ounces. Bolivia has become, with very limited exploitation, the third silver-producing country of the world, Mexico being first and the United States second; the most important silver districts are Huanchaca and Potosi. Tin is second in importance, but the quality of the Bolivian product is not regarded as first rate—that is, equal to the tin of the Straits Settlements. The principal tin-producing districts are on the eastern cordillera of the Andes, extending a distance of 300 miles and divided into four distinct groups—La Paz, Oruro, Potosi, and Chorolque. The yearly production of concentrated ore is said to be about 4000 tons. One authority places the export of tin to European markets in 1897 at 5506 tons. A fine quality of copper is found in the Corocoro district; the annual output is about 3000 tons. Gold in small quantities exists both in quartz and in river beds; its production, however, is almost limited to washings by Indians. It was reported that the value of Bolivian mineral products exported from Antofagasta in 1898 was \$29,994,914. "The principal items were silver ore, \$17,252,792; silver in bars, \$4,357,282; silver sulphurets, \$2,620,410; tin in bars or pigs, \$1,767,714."

The principal imports are provisions, furniture, hardware, alcoholic liquors, textiles, and apparel; the exports include silver, tin, copper, rubber, wool, hides and skins, cocoa, coffee, bismuth, and cinchona. The rubber export is increasing. The ports through which Bolivian commerce passes are Arica and Antofagasta (Chile), Mollendo (Peru), and the northeastern river ports of Villa Bella and Puerto Suarez. It was announced in May, 1899, that Brazil had conceded to Bolivia the latter's claim to the Acré district. Bolivia thereupon established a customs-house at Puerto Alonso on the Acré River. This port, it is said, will afford a better outlet for rubber than the port of Villa Bella, the latter being on the Madeira, a river that offers many obstructions to navigation. The following amounts, representing bolivianos, have been reported for the total imports and exports: Imports, 1897, 24,456,000; 1898, 38,400,000; exports, 1897, 25,500,000; 1898, 18,000,000. Of the countries importing into Bolivia, Great Britain ranks first, with Germany next and France third.

Communications.—Bolivian roads are in a primitive condition and throughout the republic communications are difficult. A railway connects the frontier town of Ascotan with the Chilean port of Antofagasta. In Bolivian territory the railway runs from Ascotan to Uyuni, Huanchaca, and Oruro, a total distance of about 500 miles. Other lines have been projected, and it is thought that construction will soon begin. Puno, on Lake Titicaca, is connected by telegraph with La Paz; from

this town a line runs to Oruro, Cochabamba, and Colquechaca; and the latter town also is connected with Sucre. Another line runs from the Argentine frontier through Potosi and Sucre, connecting with the Pacific coast. The total length of telegraph lines is reported to be 2980 miles, and the number of telegraph offices 68. Bolivia belongs to the postal union and has about 328 post-offices.

Religion and Education.—There is religious toleration, but the state religion is Roman Catholic. Primary education, under control of the municipalities, is gratuitous and nominally compulsory. In 1897 the primary schools numbered: municipal, 366; private, 121; total, together with 82 industrial schools, 569, the enrolment being 36,690 pupils. In the same year, for secondary education there were 8 colleges and 9 other institutions, with 91 teachers and 2057 students. For higher education there are six so-called universities, having about 500 students. Various mission schools are taught by the priests.

The Brazilian Boundary.—Pursuant to the agreement, announced in May, 1899, by which Brazil conceded to Bolivia the latter's claim to the Acré region, a joint commission was appointed to rectify the frontier in accordance with the treaty of 1867. Pending the final settlement, Bolivia will continue the collection of customs duties at Puerto Alonso.

A Revolution.—During the fall of 1898 an electoral campaign developed into an insurrection against the government of President Severo Fernandez Alonso. The insurgents, or Federalists, who were led by Señor Macario Pinilla, minister of the interior and justice in the cabinet formed when Alonso became president in August, 1896, Señor Serapis Reyes Ortiz, prefect of the department of La Paz, and Colonel José Manuel Pando, occupied La Paz, which became the centre of the rebellion. The vote of congress that Sucre be the only and permanent capital of the republic caused the people of La Paz to rebel. The seat of government in Bolivia has been changeable; in 1892 it was at Oruro, in 1893 at La Paz, and since 1894 at Sucre. On the 17th of January President Alonso's troops were defeated and he failed in his attempt at laying effective siege to La Paz. By the last of January he withdrew from La Paz and was compelled to fall back to Oruro; about the same time it was reported that discontent was rife among his men and there were constant desertions to the insurgents, who held, besides La Paz, the cities of Santa Cruz and Potosi. Toward the last of March they captured Cochabamba, and the department of the same name declared for Pando's party. Internal disorder was aggravated by various uprisings of the Indians, some of whom looted the Corocoro mining works; these works were owned by citizens of Chile, and complications with that country seemed imminent. The revolution reached a successful termination after President Alonso had retreated to Oruro in a battle fought at that city on April 12 and lasting about an hour. According to reports, about 200 men were killed. The forces of Colonel, afterward General, Pando occupied the city, and President Alonso effected his escape to Antofogasta on the coast. The commercial interests of Bolivia suffered heavily through the revolution, and the restoration of order by Pando caused great satisfaction. On October 26, 1899, General Pando was inaugurated constitutional president of the republic, "amid the enthusiastic acclamations of congress and the people." He organized a cabinet with Señor Fernando Guadialla as minister for foreign affairs, and Señor Carlos Romero as minister of the interior.

BONAPARTE, Prince NAPOLEON CHARLES GREGOIRE JACQUES PHILIPPE, third son of Prince Lucien Bonaparte, Prince of Canino, and chief of the elder branch of the Bonaparte family, died in Rome, February 12, 1899. Prince Napoleon was born in Rome in 1835 and succeeded four years ago to the headship of the elder branch of the house of Bonaparte, on the death of Cardinal Prince Lucien. Prince Napoleon took a prominent part with Maximilian, the Austrian Archduke, in the attempt to establish a monarchy in Mexico. In 1859 he married Princess Marie Christine, daughter of Prince Jean Nepomucene Ruspoli.

BONHEUR, MARIE ROSALIE (ROSA), celebrated animal painter, died at By, near Fontainebleau, France, May 25, 1899. Mlle. Bonheur achieved a fame unsurpassed by any woman artist, and in her own department of animal painting is placed in the front rank of painters. She was the daughter of Raymond Bonheur, a drawing teacher living at Bordeaux, and was born March 22, 1822. At an early age she gave evidence of artistic ability. This was trained and developed by her father, so that when still very young she acquired a fine technique. Mme. Bonheur died in 1833, and the father and children moved to Paris, where Rosa improved her opportunity of studying the pictures in the Louvre. The family was poor and for a time the girl was apprenticed in a dressmaker's shop, but she soon returned to her copying in the Louvre. Here she worked regularly, and not infrequently sold her pictures to advantage. At the same time she helped her father in the preparation of drawings for the publishers. In 1841 she succeeded in having two pictures exhibited

at the Salon, "Goats and Sheep" and "Two Rabbits," both pictures having been painted from living models in her father's studio. For many years thereafter she exhibited annually at the Salon. She also did some work in sculpture in her early career, and in 1845 received a gold medal of the third class, and one of the first class in 1848. In the latter year she and her brother and sister, Auguste and Juliette, as painters, and her brother Isidore, as a sculptor, exhibited at the Salon. From this period until she died Mlle. Bonheur kept what might fairly be called a menagerie, consisting of various kinds of wild, but especially of domestic animals and birds, which she used for models. At this early time also she began a minute and scientific study of animal anatomy, carried on especially at the *abattoirs*. At the Salon of 1846 she was awarded the third medal for her "Red Oxen of Cantal." She exhibited at the Salon of 1849 the first of her large canvases and one of her best, "Plowing in Nivernais." For this picture she received from the French government 3000 francs. In 1853 she exhibited another large picture, which is said to be the largest ever produced by an animal painter and for which she received all the honors of the Salon. This was her most famous work, the "Horse Fair," for which she received from Mr. Ernest Gambart 40,000 francs, and which, after passing through the hands of W. P. Wright and of A. T. Stewart, of New York, came into the possession of Cornelius Vanderbilt for the consideration of \$55,000. Mr. Vanderbilt presented the painting to the Metropolitan Museum in New York, where it now hangs. After exhibiting this painting, Rosa Bonheur was exempt from examination at the Louvre. From 1850 she lived at By. It was here in 1805 that the Empress Eugénie presented her with the cross of the Legion of Honor. Years afterward President Carnot made her an officer of the Legion, an honor held by no other woman.

About the year 1850, in order better to prosecute her work at the *abattoirs* and horse fairs, Mlle. Bonheur assumed male attire. For many years thereafter she continued to work assiduously at her anatomical studies and her painting. Among her famous works, besides those already mentioned, are: "A Limier-Briquet Hound" (1877), "Weaning the Calves," "Deer in the Forest-Twilight" (1885), all in the Metropolitan Museum; "Deer Drinking" (1877), in the Lenox Library, New York; "Sheep at the Seaside," bought by Empress Eugénie; "Lion at Home"; "Hay-making in Auvergne"; "The King of the Forest"; "The Stampede." As a painter of animals Rosa Bonheur ranks not unfavorably with Landseer. She lacked, however, the characteristics of sentiment and of humor that were his. She may be called a matter-of-fact master of technique; she lacked the qualities of fine poetic vision and of imagination. This, however, is not an adverse criticism of her work; we may assume that she realized her own strength and her limitations, for she never attempted to enter that higher sphere of art represented so well in her time by Millet, Burne-Jones, and Puvis de Chavannes. Rosa Bonheur had genius; and when to this she added untiring study and singleness of purpose she became in her own sphere an artist unsurpassed.

BONNER, ROBERT, founder of the *New York Ledger*, died at his home in New York, July 6, 1899. He was born near Londonderry, in the north of Ireland, on the 28th of April, 1824. When fifteen years of age he came with his parents to the United States and entered as an apprentice in the office of the Hartford (Conn.) *Courant*. During the next five years he mastered the printer's trade and devoted his leisure hours to study. So expert did he become in setting type that he established a record that was unbroken for many years—namely, the setting of 25,500 ems of solid type in twenty hours and twenty-eight minutes. In 1844 he went to New York, where he became proof-reader and assistant foreman in the office of the *Evening Mirror*, of which N. P. Willis, the poet, was then the editor. While in this position Bonner acted as correspondent for the Hartford *Courant* and for papers in Washington, Albany, and Boston. In 1850 he bought for \$900 the *Merchant's Ledger*. This was a journal merely of trade and finance, and was not in a prosperous condition. Bonner immediately introduced new features, and the paper gradually gained appreciation not only in the business world, but especially in the home.

In 1855 the name was changed to the *New York Ledger*, and from that time Robert Bonner showed a genius, unsurpassed in the publishing world, in issuing a paper that would catch the fancy of the "plain people." He believed in honest advertising, and this he employed in various unique ways, and to an unprecedented extent. He succeeded in persuading many of the most popular writers of his time to contribute to the *Ledger*, which became under his sagacious management one of the most popular story papers in America. The famous sister of N. P. Willis, "Fanny Fern" (Mrs. James Parton), wrote for him a story of ten columns in length, for which she received \$1000. In consideration of a gift by Bonner of \$10,000 to the Mount Vernon Association, Edward Everett contributed for a year weekly letters. Henry Ward Beecher received \$30,000 for his *Norwood*; Long-

fellow, \$3000 for a poem; Tennyson, \$5000 for a poem; Dickens, \$5000 for *Hunted Down*, the only work the great novelist ever wrote for an American publication. Many other writers of popular favor or permanent merit were enrolled by Bonner in his list of contributors; among these were Sylvanus Cobb, John G. Saxe, Mrs. Southworth, Leon Lewis, Harriet Lewis, William Cullen Bryant, James Parton, and Bishop Clarke, of Rhode Island. To these authors he paid what was then unprecedented prices; and the prices paid as well as the articles received he used as advertisements. So well did these and other advertisements, together with the real and constant merit of the paper, succeed, that the *Ledger* came to have a circulation of 100,000 copies. For thirty-seven years he was editor and proprietor of this paper, and amassed a fortune estimated at \$6,000,000. In middle age Bonner became a prominent horse fancier. At the time of his death he owned about fifty horses, which were kept at his stables in New York and on his farm in Tarrytown. In May, 1898, he stated that he had expended about \$600,000 on horses. He disapproved of professional racing and his stock never competed for money. Among the famous horses owned by him were Dexter, Pocahontas, Startle, Rarus, John Taylor, Edward Everett, Pickard, Maud S, and Sunol. For these last two he paid \$30,000 and \$41,000 respectively, and their respective records are 2.08¾ and 2.08¼. He gave largely to charities and was prominent in church work.

BOOTH, HENRY MATTHIAS, D.D., president of Auburn (N. Y.) Theological Seminary, died at Auburn, March 18, 1899. He was born in New York City, October 3, 1843; was graduated at Williams College in 1864, and at Union Theological Seminary three years later. From this year (1867) to 1891 he was pastor of the Presbyterian church at Englewood, N. J. Having resigned this charge, he passed a year in European travel, and then became associated with Dr. Henry Van Dyke, of the Brick Presbyterian Church of New York. In October, 1893, Dr. Booth was elected president of Auburn Seminary. Besides his executive work at this institution, upon him devolved the duties of professor of practical theology. Among his writings are *The Heavenly Vision and Other Sermons* and *The Sunrise, Noonday, and Sunset of the Day of Grace*.

BORAX. The production in 1898 was 16,000,000 pounds, valued at \$1,120,000. California continued the source of supply, important beds being located at Daggetts. The borax is mined by drifting into the hill.

BORNEO, one of the largest islands in the world, lies in the Malay archipelago, and has an area of about 300,000 square miles, being 800 miles long and 600 broad. The greater part of its territory is divided between the British and the Dutch. The population of the whole island has been estimated at 1,846,000. It was reported in 1899 that borings for petroleum had been made in several places with such success that people were beginning to regard the country as likely to become one of the richest petroleum fields in the world. The Bombay-Burma Trading Company has had such good success in obtaining petroleum that it has begun to build a refinery, and has also extended its operation to the island of Labuan. Favorable conditions have been found in the southern and eastern parts of Borneo as well, and several companies are working petroleum in those regions. There is a refinery at Balikpapan, one of the finest harbors on the coast, and at Koeti it was reported that one of the largest refineries of the world was in process of construction. Plans are made to lay out pipe-lines and invest large capital in the business. Coal, marble, precious metals, and diamonds have also been found. There is an abundance of wood and water, and the only real obstacles in the way are the climate and the scarcity of labor. The latter difficulty has been met by the importation of coolies from China and Java. The commercial development of the country is encouraged by the native sultans. The British possessions include British North Borneo and the neighboring territories of Brunei and Sarawak.

BRITISH NORTH BORNEO is governed by the British North Borneo Company, but is under a formal protectorate which was proclaimed by the British government in May, 1888. There is a governor, whose appointment must receive the approval of the secretary of state, and who is assisted in the administration by a council and by residents in the districts. The government has alienated a large part of the land for plantations. The chief products are timber, rice, sago, sugar-cane, coffee, cocoa, gambier, gutta-percha, tapioca, India-rubber, edible bird's nests, gums, sweet potatoes, and tobacco. Mineral products include gold, copper, and coal. The colony is self-supporting, and the revenue is derived chiefly from opium, sales of lands, duties, and royalties on exports. The trade is chiefly with Great Britain by way of Singapore. The colony is connected by cable with Labuan and Singapore. The chief towns are Sandakan, the residence of the governor; Gaya, Kudat, Silam, and Mempakol. There is a short railway line in process of construction from the western coast inland.

BRUNEI is also a British protectorate, but its local administration is in the hands

of a native sultan. The area is about 3000 square miles, and the chief town is Brunei, with a population of about 5000.

SARAWAK has an area of 50,000 square miles, and a population of about 300,000. It is under the government of a rajah (Sir Charles J. Brooke in 1899), and has been under British influence ever since Sir James Brooke, the uncle of the present rajah, obtained the government in 1842 from the Sultan of Brunei. It is a flourishing colony, and carries on a considerable trade in timber and jungle produce. The products are like those of North Borneo. The chief town is Kuching, on the Sarawak River.

DUTCH BORNEO comprises about two-thirds of the island, including the southern and western coast, and having an estimated area of 212,737 square miles, with an estimated population in 1895 of 1,180,578. The chief Dutch settlements are at Banjarmasin, Pontiana, Sambas, and Koti.

BORNU, an African state of the central Soudan, lying between the sultanate of Sokoto on the west and Lake Tchad on the east, with an estimated area of 50,000 square miles, and an estimated population of 5,000,000, consisting chiefly of people of mixed negro and Dasa descent, but comprising also Tuareg Berbers, Arabs, and pure negroes. Capital, Kuka (population, 50,000 to 60,000), on the west shore of Lake Tchad. It is one of the most populous of the Mohammedan states. It is under an absolute sultan or sheikh, who governs with the aid of a council of military chiefs, and has a standing army of 30,000 men. The Magomi tribes occupying central Bornu are said to be fairly advanced in the arts of civilized life, and show great skill in metal-working, weaving, and the making of pottery. Kuka is an important trading centre, being the objective point of the caravan route from Tripoli and Fezzan.

BOSNIA and HERZEGOVINA, the two Turkish provinces in the western part of the Balkan peninsula, between Dalmatia on the west and Servia on the east. They have been administered and occupied by the Austro-Hungarian government under the terms of the treaty of Berlin in 1878. Their area, including the sanjak of Novi-Bazar, is 23,571 square miles, and their population in 1895 was 1,568,092, of whom 673,246 belong to the Oriental Orthodox Church, 548,632 are Mohammedans, and 334,142 Roman Catholics. Agriculture is the main occupation, though the methods employed are primitive, and it engaged in 1895 about 88 per cent. of the whole population. The soil is fertile, and the chief products are wheat, maize, barley, oats, rice, millet, buckwheat, potatoes, flax, and hops. More important than any of these is tobacco, which is a government monopoly. Fruit is raised in both provinces in abundance, and in Herzegovina there is a small production of wine. The mineral resources are considerable, and the government is making efforts to develop them. Coal is the main mineral product, but copper, manganese, chromium, quicksilver, ammoniac soda, and salt are also mined. Cattle-raising occupies a large part of the population, and silk-culture and the production of beet sugar are carried on to some extent, and about 45 per cent. of the land is under forests. Recent years have been marked by a rapid economic development. In 1887 the annual budget amounted to only 9,000,000 florins, while the budget estimates for 1899 were: Receipts, 19,549,250, and expenditures, 19,496,780. The receipts are chiefly from indirect taxes, which were estimated to yield 10,200,000 florins in 1899. The estimate from the direct taxes in 1899 was 5,500,000 florins. Under the encouragement of the government manufactures have increased in the last few years. Railway-building had also advanced very rapidly. In the decade 1886-96, the railway lines increased from 402 kilometres to 708 kilometres, and from 1896 to 1899, 306 more kilometres were built. The government is now preparing to build a long line connecting important military points which, upon completion, will unite Dalmatia with the interior, and indirectly with Hungary. Another sign of increasing business activity is the establishment of financial institutions. There is a native military force of 5185 men on a peace footing, and the Austro-Hungarian army of occupation is about 23,000 strong. The administration is directed by the imperial government of Austria-Hungary through the Bosnian bureau, at the head of which is the imperial minister of finance at Vienna. Sarajevo, the capital, is the seat of the provincial government, which consists of the three departments of finance, internal affairs, and justice. The executive is aided by an advisory board consisting of the prelates of Sarajevo and twelve representatives of the people.

BOSTON PUBLIC LIBRARY, a system of libraries in the city of Boston, Mass., comprising a central library building in Copley Square, 10 branch libraries with independent collections of books, situated in different parts of the city, and 19 stations which have deposits of books from the central library. Besides these the central library delivers books to 7 public schools, 16 reformatory institutions, 23 fire companies, and 1 post-office. This library handles a greater circulation of books than any other library in the world, receiving applications for books from persons

in many of the Eastern States. The buildings and grounds represent an outlay of \$5,000,000. The central library building is decorated with works of art of a high order. The endowments for the purchase of books amount to \$218,000, besides \$50,000 for the purchase of newspapers. In 1899 the number of books in the library was 735,168, the number of persons drawing books was 64,478, and the number of persons visiting the library was over 2,000,000. The library is open from 9 A.M. to 10 P.M.

BOTANY. The present article is intended to convey some idea of the more important features connected with the botanical progress during the year 1899. It should be stated at the outset that so far as questions of botanical research are concerned, the past year has not been marked by striking discoveries, but the work done, nevertheless, constitutes valuable contributions to knowledge and may be expected to bear mature fruit later. There is, however, considerable interest and activity being manifested in the United States in the subject of teaching botany, as is evident from the large number of text-books issued during the past and previous year. The methods of studying botany, so prominently advocated by our most recent text-books, must be considered of a transitory rather than permanent nature, and it would not be surprising if the following year should witness something of a reaction toward some of the methods advocated in the latest acquisition to teaching botany. The number of publications embodying original work are rapidly increasing each year, especially in the United States, where modern research methods have become firmly established.

The utilitarian side of botany has developed in the United States to a greater extent within the past few years than in any other country, and there is a vast amount of economic literature published annually, the past year being no exception. This can be traced to the establishment of a large number of agricultural experiment stations and technical institutions a few years ago, which are becoming year by year better equipped, and are turning out more work of a high order; and to the fact that the inherent practical nature of the American mind demands that science shall go with practice. The enormous resources of the United States and the wealth which they represent make scientific investigation of a practical nature very desirable.

Pedagogy.—The enormous strides that have been made in botanical teaching within the last decade have completely changed the course of study in our schools and colleges, as a result of which a great variety of text-books of a totally different character from those which were in use previously have made their appearance. The introduction of nature study into our secondary schools is responsible more than anything else for the unusual abundance and unique character of our modern botanical text-book. The emphasis given to the questions, What, How, and Why of plant phenomena in the secondary schools has led authors of botanical text-books to pay considerable attention to these questions in our colleges and universities. As a consequence of the thorough hold which these questions have upon modern methods of teaching, such subjects as morphology, physiology, and ecology, or, in other words, form, function, and the influence of the environment, have received special attention in our more recent text-books of botany.

The past year has witnessed considerable activity in the publication of new text-books relating to botany which especially predominate in ecological matter or questions relating to the influence of the environments upon plants. Then, again, there are a host of general works upon botanical subjects that have appeared. There are undoubtedly a larger number of elementary popular works touching upon botany, such as readers for secondary schools, illustrated floras, folklore of plants, etc., that are published each year, than in any other branch of natural science. Some of the more important text-books and elementary guides for teachers that have been issued during the past year are as follows: *The Teaching Botanist*, by W. F. Ganong, representing a series of essays touching upon all of the modern phases of teaching; *Plant Relations*, by J. M. Coulter, representing, as its name implies, a work in ecology (a second volume, entitled *Plant Structure*, is to be issued shortly; this is the first attempt to present ecology or plant relations so extensively in an elementary text-book and to have it precede structure); *An Elementary Text-book of Botany*, by S. H. Vines, being a smaller edition of his *Student's Text-book*, issued a few years ago; *Seed Dispersal*, by W. J. Beal, intended to help young botanists and teachers; *Flora of Southern States*, by S. M. Tracy, especially designed to supplement *Bergen's Text-book of Botany*; *The Corn Plants: Their Uses and Ways of Life*, by F. L. Sargent, a reader and teacher guide; *Strassberger Noll. Schenck, and Schimper Text-book of Botany*, fourth edition.

Systematic Botany.—The progress made in the study of genera and species during the past year has been equal to that of the preceding year. Unfortunately, however, confusion still exists in phænogamic nomenclature, and this feature cannot be conducive to the welfare of this branch of botany, neither is it to botanists in general,

who are frequently dependent upon technical names of plants. The greatest energy during the past year in systematic work has been expended upon the study of African, western North American, and Central and South American plants. Among others who have been active in this line of work may be mentioned the following: The North American species of higher plants, exclusive of Mexican, have been studied by G. V. Nash, M. L. Fernald, E. P. Bicknell, B. L. Robinson, K. M. Wiegand, A. Nelson, W. A. Setchell, P. H. Rhyberg, T. S. Brandegee, J. M. Coulter, C. S. Sargent, J. K. Small, E. Nelson, E. L. Greene, A. M. Vail, R. I. Cratty, F. L. Scribner, A. A. Heller, J. S. Smith, and C. D. Beedle. Mexican and South and Central American plants have been described by B. L. Robinson and J. M. Greenman, J. D. Smith, J. N. Ross, W. W. Rowlee, R. Pilger, F. Kranzlin, F. Pax, P. Dietel, F. W. Heger, and F. Buchenau. The species of the West Indies have been studied by Urban, Lindau, and Schlechter. The African plants have been studied by A. Engler, who has published two parts of his African flora, which represent the first attempt to classify this little known region. Engler points out that there exists a striking relationship between the forest flora of Africa and tropical America; a less striking relationship with the tropical Asiatic forests; an important difference between the forest floras of East and West Africa, and an evident difference between the Abyssinian forest flora and that of the rest of tropical Africa. Among other contributors to our knowledge of the African flora may be mentioned G. Lopriore, W. Rhuland, R. Schlechter, E. Hackel, H. Schinz, H. Hallier, and A. Pestalozzi. F. Reinecke has published a flora of the Samoan Islands. New species of North American fungi have been described by C. H. Peck, E. D. D. Holway; new ferns by L. M. Underwood; a monograph of the Californian *Heptacis* by M. A. Howe, and a conspectus of the genus *Lilium* has been presented by F. A. Waugh. The fourteenth volume of *Saccardo Sylloge Fungorum* is now completed, which brings this work fairly well up to date. The present year also marks the completion of Vols. II-IV. of Engler and Prantl's *Pflanzenfamilien*, which constitutes the most important work in systematic botany in recent years.

General Morphology and Histology.—The structure of the embryo sac in *Sparganium* and *Lysichiton* has been studied by D. H. Campbell. The author points out the resemblance of the antipodal cells of *Lysichiton* to certain composite, and he no longer regards these cells as merely vestiges of the primitive prothallial tissue, although they may represent this tissue, but on account of their greater development in these types he maintains that they possess an important physiological function. Recent investigation by Oltmanns upon *Ectocarpus siliculosus*, a species of marine algæ, have led him to abandon his former position in regard to the non-fusion of zoospores. He maintained that what Berthold saw and described as fusion of the zoospores was in reality infusoria capturing and devouring the zoospores. He now admits his mistake, and maintains that Berthold's conclusions are correct.

No group of the *pteridophyta* possesses a life history so little known as the *lycopodiaceæ*, and a paper upon the *Prothallus* of *Lycopodium Clavatum*, by W. H. Lang, possesses some botanical interest. The prothallus of this species was found below the surface of the ground, where it passes a purely saprophytic existence, and during a certain stage of its development it is intimately associated symbiotically with mycorrhiza. The author presents a discussion of the relationship existing between the *lycopodiaceæ* and *pteridophyta* from the knowledge we possess of their life history. Another paper has appeared during 1899 which treats of a group belonging to the vascular cryptogams and is entitled *Equisetum and Its Allies*, by E. C. Jeffrey. The author concludes that *equisetum* is more closely related to the club-mosses than to the ferns. Under the title of *Propagation of Mosses by Asexual Organs*, C. Correns has given the results of a large number of experiments on the propagation of mosses by cutting, etc., together with a morphological study of the brood organs. The development of the *microsporangia* and microspores of *Hemerocallis fulva* has been studied by E. L. Fuller. The origin of the *sporangium* is pointed out and bipolar spindles are described. The structure and development of *Cryptomitrium tenerum*, a Californian liverwort of rare occurrence, is described and illustrated by Le Roy Abrams, and its relation to other genera is pointed out. The interest shown in the question of sexuality of lichens has always been quite marked on account of the meagre knowledge which we possess of this group of plants. Some years ago Stahl announced the discovery of sexuality in collema, a gelatinous lichen, but the nature of this process has been for many years quite imperfectly known, and even the authenticity of Stahl's observations has been doubted. Baur, however, has recently confirmed Stahl's original observation, and he has been able to add very much to our knowledge of the sexual organs. Other noteworthy contributions to morphological literature during the year are: *A Morphological Study of Podophyllum peltatum*, by T. Holm; *The Origin of*

the *Leafy Sporophytic*, by J. M. Coulter; *Anatomy of the Dicotyledons*, by H. Solereder, and a popular work by Sir John Lubbock on *Buds and Stipules*.

Vegetable Physiology.—The number of papers relating to physiology during the past year have been numerous, and have dealt with many interesting and important matters which cover a wide range of subjects. The phenomena of coloration in leaves have been studied by Overton, who found that the red cell sap is connected with a rich content in sugar; that low temperatures induce red coloration, and that the red coloration in many winter leaves, the reddening of many fruits, and the deeper coloration of Alpine plants may be due to an increase of sugar at the expense of starch.

The penetrating power of fungi has been further investigated by Lind, who has shown how fungi pass through bone, limestone, and even crystals by the secretion of carbonic and oxalic acid. This action is dependent upon chemotropic stimuli, which is usually furnished by some organic or inorganic food material.

Nordhausen has investigated the question of infection of plants by fungi. He has been able to show that certain fungi (*hemisaprophytes*) cannot gain entrance to the plant without nourishment additional to that contained in the spore. He maintains that the spores during germination secrete a substance that digests the cell-wall, thus producing a soluble substance which attacks the germ tube chemotropically. There is later produced a toxic which kills the protoplasm and allows the fungus to thrive saprophytically. Both of the preceding papers contain data which from our present knowledge we naturally anticipated, and while they are purely of an uneconomic nature they constitute welcome contributions which will be useful in the study and treatment of plant diseases. The careful investigations of Kolkwitz on the respiration of fungi (*aspergillus*, *penicillium*, *bacteria*) as influenced by electric light showed an increase in the respiration of about 10 per cent., which is quite contrary to what might be expected. F. C. Newcombe has investigated the subject of cellulose enzymes. He finds that they act upon starch very feebly and upon reserve cellulose so energetically, that they must be regarded distinct from diastase. Contribution to our knowledge of symbiosis and saprophytism has been made by D. T. MacDougal. He recognizes two distinct types of *Endotropic mycorrhiza*—namely, one adapted to nitrogen fixation, and a second for the absorption and modification, perhaps oxidation, of humus products by the fungus, and their liberation in the tissues of the host plant. The greater number of examples he found are included under the last type. The peculiar effects of centrifugal force upon cells of certain plants have been brought out by D. M. Mottier. He employed a centrifugal force equal to 1800 times that of gravity and found in the cases of mosses, algæ, and phanerogams that the movable plastic contents of the cells were made to fall into a compact mass at the end of the cells. In cells which were not killed outright the displaced cell-contents gradually redistributed themselves. He observed in dividing cells of certain algæ that centrifugal force caused the cell-wall in the process of formation not to be completed. In the case of the corn (*Zea mays*) the nucleolus was thrown out of the nuclei membrane into the cytoplasm, from which they never returned. B. Hansteen has shown that light in general, at least, plays no direct rôle in the synthesis of proteids in the bodies of green plants. Important investigations upon the toxic effect of deleterious agents in the germination and development of certain fungi have been made by J. F. Clarke. The extensive summary given makes it impossible to go into details concerning the results which he obtained. He shows, however, that fungi are more sensitive than higher plants, and that different species as well as particular forms of the same species present great differences of sensitiveness to reagents. Experiments of this nature have a practical bearing upon vegetable pathology, inasmuch as the application of fungicides have a wide range at the present time. The remarkable strides made in physical chemistry of late years render it possible for us at the present time to place our crude knowledge of fungicides and insecticides upon a scientific basis.

The influence of intense cold produced by liquid hydrogen on the germination of seeds has been tested by Dewar. It was found that whether the seeds were immersed in the liquid hydrogen without protection, or whether they were cooled in sealed tubes, they germinated even when exposed to a temperature of 250° C. for one-half hour.

The power of one organ to perform the function of another in case of need is well known. Vöchting has published a treatise giving the result of his studies upon correlation in organs and tissues. He has demonstrated that a tuber may replace a stem if put in such a position that its normal function is interfered with, or a tuber may develop from almost any organ if the normal function of the tuber is suppressed. He showed, for example, that by darkening the hypocotyl of radishes with tin-foil that tuberous swellings occurred at the places darkened. The influence of external factors as affecting the configuration of plants are fully discussed, and

the author thinks that not only the internal forces which concern the propagation of the species is responsible for this phenomena, but is also due to a demand for organic symmetry. The experiments are especially notable in showing the great plasticity of plants.

The influence of physical and chemical factors upon the reproduction of *saprolegnia*, a water mould, has been investigated by Klebs. He has shown that this species will grow indefinitely without either sexual or asexual reproduction if nourishment be abundant. If, on the other hand, the hyphæ are starved, the extensive formation of zoospores takes place. This author found that by varying the concentration of the nutritive medium, the fungus can be made at will to assume a purely vegetative condition. He maintains that there is no inherent tendency toward alternation of generations, although the conditions in nature are such that an alternation of generation is usually brought about through the exhaustion of the nutriment.

Some of the more important hand-books and text-books touching upon physiology which have appeared during the past year are as follows: *General Physiology*, by Max Verworn; *Experimental Morphology*, Pt. II., by C. B. Davenport; *The Soluble Ferments and Fermentation*, by J. R. Green; *The Chemical Energy of the Living Cell*, by O. Loew.

Ecology (Life Relations).—The interest manifested in this comparatively recent division of botany—namely, the study of the life relations of plants—is increasing each year and represents an attempt to correlate some of the data which morphological and physiological investigations have brought out during the last few years. To the investigations of Darwin, however, more than any one else, does ecological study owe its inspiration.

Some of the more important contributions to ecology during the year are as follows: A work which marks a period in ecological development appeared at the beginning of the year, and is entitled *Plant Geography*, by A. F. W. Schimper, a treatise founded upon a physiological basis. The exhaustive and original manner in which plant relations are treated in this work is destined to make it a classic. Some years ago Müller published a treatise upon the fertilization of flowers by insects, and a similar hand-book, based upon Müller's work and termed *Flower Ecology*, has been written by P. Kunth. This work, which consists of two volumes, brings the data bearing upon the relationship existing between flowers and insects fairly up to date. Further contributions to our knowledge of the relations existing between flowers and insects have been made also by C. Robertson and J. Plateau. There has been a marked tendency of late years to discredit the ideas held by Müller, Lubbock, Darwin, and others in regard to the colors of flowers being the principal attractive agent to insects, and Plateau has endeavored to show in the case of salvia and hydrangea that insects are attracted to these flowers regardless of their color, inasmuch as when the showy floral envelopes were removed insects were attracted to them just the same as when the floral envelopes were present.

E. Warming has published an interesting ecological description of the vegetation of tropical America, which is the result of two visits—one to Brazil and one to Venezuela. He divides the vegetation into three parts—namely, the forests, the scrub or thorny vegetation, and the savannas or campos.

A work representing an extensive ecological study is entitled *The Ecological Relations of the Vegetation on the Sand Dunes of Lake Michigan*, by H. C. Cowles. The writer shows that the dunes of Lake Michigan have been determined largely by westerly winds. He finds important differences between the vegetation of the beaches washed by summer waves and those washed by winter waves, and gives a list of the most successful dune-forming species of plants.

W. Meyer has studied the influence of weather and the condition of the soil upon the anatomical structure of plants when growing under normal conditions. He compares numerous members of the same family, chiefly Alpine plants, and shows how species in different divisions of the same family possess a close resemblance to one another when growing in similar situations. For example, certain species of the *caryophyllaceæ*, belonging to different genera, growing in desert regions, resemble each other, as also do those growing in Alpine regions, while, on the other hand, plants of the same species, as is well known, show a marked difference when growing under various conditions. Meyer maintains that common origin does not explain this phenomenon, but it is due to environmental factors or life relations.

The adaptation of leaves to the intensity of light has been studied by J. Wiesner. He shows how vegetation in forests, and, in fact, all plants which grow in deep shade, possess leaves that adapt themselves to obtain the maximum amount of diffused light. The light absorption of a plant is the relationship of the intensity of light at the spot where the plant grows.

The influence of sun and shade upon vegetation is still further shown by M. Berthelot's investigations. By comparing the dead weight and the chemical composition of the ash of plants grown in the shade and fully exposed to the sun he found that

the richness of carbon in a plant is the greatest when developed in the sun and least in the aftermath. Phosphorus and sulphur, on the other hand, are present in the largest quantities in plants grown in the shade.

Vegetable Pathology.—The amount of investigation relating to the diseases of plants is at the present time so large that a number of special publications are devoted to this subject alone, besides numerous bulletins treating of plant diseases are issued from the various experiment stations throughout the world. The attention, however, given to this subject in the United States at the present time far exceeds that of any other country, and especially is this true in regard to remedial measures. The following brief reference to a portion of the works relating to the pathology of plants can only be presented here.

Investigation made by A. F. Woods has resulted in showing that a so-called disease of the grape vine, described some years ago by Viola and Sauvageau, is not a disease at all; but the abnormal condition which they observed in the cells, and supposed to be due to a parasitic organism, can be produced by reagents. He has been able to produce precisely similar results in the lily, tobacco, rose, hyacinth, and even in spirogyra cells by the use of certain staining reagents.

A disease known as sorghum blight has been found by M. Radium to be caused by a species of yeast. His material was obtained from Algeria, and while he does not maintain that the conclusions reached by Burrill, Kellerman, and Swingle in this country are incorrect, in so far as the disease is caused by bacteria, he does maintain that the red condition of affected sorghum plants is due to the presence of yeast.

A bacterial disease of the sugar-beet has been worked out by Clara A. Cunningham. It was shown that the germ is able to break down cellulose, hence its capability of spreading from one cell to another. The disease is said to be dependent primarily upon drought and successive low temperatures.

Apple canker, which attacks the bark of the limbs of apple-trees of all ages, has been traced by W. Paddock to be caused by the action of the fungus *Sphaeropsis malorum* Pk., which is the same fungus that causes the black rot of apples. The disease is also peculiar to pears and quinces, and in most cases proceeds from the smaller branches to the trunk, not infrequently killing the tree.

E. F. Smith has published a comprehensive account of *The Wilt Disease of Cotton, Watermelon, and Cow-Pea, as Occurring in the Southern United States*. A five years' investigation of the disease shows that it is caused by a fungus, which penetrates and clogs the vessels, hence shutting off the passage of water from the soil to the aerial parts of the plants. The fungus causing this disease appears to be a new one, and the author has created a new genus for it.

Some other publications relating to pathology are as follows: *A New Rice Smut*, by A. P. Anderson; *A Horn-Destroying Fungus*, by H. M. Ward; *A New Pansy Disease*, by R. E. Smith; *Studies of the Life Histories of Rusts*, by E. Fisher; *Cereal Rust of the United States*, by M. A. Carleton; *A Fat-Destroying Fungus*, by R. H. Biffen; *The Potato Bacteriosis in St. Petersburg*, by K. S. Iwanoff; *Fungus Diseases of the Sugar-Beet and Peach Leaf-Curl*, by B. M. Dugger; *Leaf Scorch of Sugar-Beet*, etc., by F. C. Stewart; *A Soil Bacillus of the Type of De Bary's B. Megatherium*, by W. C. Sturgis.

Cytology.—The study of the cell (cytology), which was so energetically begun by Strassberger and others a few years ago, has received much attention the past year. It would appear from the number of publications of an elaborate character that this subject receives its full share of attention in the United States at the present time. The importance which is attached to the questions of heredity and variation at the present time renders cytological investigation a fascinating study, although it must be confessed that the prospect of solving hereditary problems by means of histological technique and microscopical observation seems as remote as it did a decade ago. The present time, however, is not opportune to present a retrospective view of cytological results, hence a brief *résumé* of some of the papers relating to this subject will follow.

A paper discussing the possible function of the nucleolus in heredity has appeared from H. H. Dixon. He reviews the various theories in regard to the organs which bear the hereditary qualities, and offers evidence which seems to show that the nucleolus may possibly be the transmitter of heredity.

Under the title *Oogenesis in Pinus Laricio*, C. J. Chamberlain presents his results of a study of the oosphere. From his observations it appears that non-support is thus given to the theory that the ventral canal cell is the homologue of the egg. The karyokinetic division of the nucleus of *Allium cepa* has been further investigated by Némec. He takes exception to the view held by Mottier, Osterhout, and others, in regard to the multipolar achromatic spindle, but believes it to be bipolar from the beginning of its formation. He describes certain fibres connected with the chromosomes, which, he maintains, are entirely different in structure from those first formed in the spindles. Any statement concerning their function, he maintains, would be

mere speculation, but suggests that they may assist the fibres connected with the chromosomes. Nawaschin and Guignard have investigated the peculiar behavior of the male cells in *Lilium martagon*. Of the two male nuclei, they observed that one fuses with that of the egg, while the other, probably the first one to leave the pollen tubes, fuses with one of the pollen nuclei. The male nuclei are described as long, twisted bodies, many of which present appearances suggesting possible motility. They appear, however, to be devoid of cilia, but are considered, nevertheless, *antherozoids*.

A cytological paper by Farmer and Williams deals with the life history and cytology of the *fucaceæ*. These investigations have brought out many interesting points, among others of which may be mentioned the mode of attachment of the spermatazoids; the sudden appearance of conical projections on the surface of the egg, together with the simultaneous repulsion of the supernumerary spermatazoids. The authors consider the phenomena of repulsion of the spermatazoids as marking the moment of fertilization. F. L. Stevens has discovered that the oosphere of *Albugo blitii* is a compound oosphere in that it contains several functional sexual nuclei. This constitutes the first discovery of a compound oosphere either in the vegetable or animal kingdom. A recent paper upon the cytology of *Achlya Americanum*, by A. H. Trow, has brought out some criticisms from Hartog regarding the long-debatable question as to whether fertilization takes place in the group of plants known as the *Saprolegniaceæ*. Trow is convinced that fertilization does take place, while Hartog, together with many other botanists, believes that it does not.

Among other noteworthy cytological papers may be mentioned those of B. M. Davis, who has presented his studies of the spore mother cell in *Anthoceros*, and the results of a critical study of the reduction which takes place in the nucleus of *Arisæma triphyllum* and *Lilium grandiflorum* have been published by G. F. Atkinson. A recently issued handbook, entitled *Cytological Technique*, by E. Fischer, contains a description of the latest methods in cytological study.

General Botanical Works Issued During the Year.—*A Glossary of Botanical Terms*, by B. D. Jackson; *Fossil Botany*, Vol. II., by A. C. Seward; *A Manual of Botany*, by David Hauston; *Handbook of Practical Botany*, by E. Strassberger; *The Botanists of Philadelphia and their Works*, by J. W. Harshberger; *Moulds, Mildews, and Mushrooms*, by L. M. Underwood; *The North America Slime Moulds*, by T. H. MacBride; *How to Know the Ferns*, by F. T. Parsons; *A Guide to the Wild Flowers*, by Alice Lounsbury; *The Evolution of Plants*, by D. H. Campbell; *Field, Forest, and Wayside Flowers*, by Maud Going; *The Grasses, Sedges, and Rushes of the Northern United States*, by E. Knobel.

Organizations.—Section G (Botany) American Association for the Advancement of Science met at Columbus, O., August 21-26, 1899. The officers for 1899 were as follows: Vice-president, C. R. Barnes; secretary, W. A. Kellerman. Thirty-three papers were read. Wednesday, August 23, was designated Sullivant Day, and was used to commemorate William S. Sullivant (died 1873) and Leo Lesquereux (died 1888), two able bryologists. Vice-president C. R. Barnes delivered an address on the *Progress and Problems of Plant Physiology*. The officers for 1900 are as follows: Vice-president, William Trelease; secretary, D. T. MacDougal.

Botanical Society of America. Fifth annual meeting held in Columbus, O., in connection with the American Association for the Advancement of Science. The officers for 1899 were as follows: President, L. M. Underwood; vice-president, B. L. Robinson; treasurer, Arthur Hallock; secretary, G. F. Atkinson; counsellors, C. E. Bessey, W. P. Wilson.

The address of the retiring president, N. L. Britton, was on *The Development of the New York Botanical Gardens*. Eleven papers were read and four new members were elected. The officers elected for the following year, 1900, are as follows: President, B. L. Robinson; vice-president, B. D. Halsted; treasurer, A. Hollock; secretary, G. F. Atkinson; counsellors, B. T. Galloway, D. P. Penhallow.

Botanical Club of the American Association for the Advancement of Science. Officers for 1899 were as follows: President, B. D. Halsted; vice-president, F. H. Knowlton; secretary, Stewardson Brown. Twenty-six brief communications were presented.

The officers for 1900 are as follows: President, F. S. Earle; vice-president, A. D. Selby; secretary, F. E. Lloyd.

The three preceding societies meet as usual with the American Association for the Advancement of Science during the summer of 1900 at New York.

Society for Plant Morphology and Physiology held its third annual meeting at New Haven from December 26-29, 1899. Twenty-nine titles of papers were presented, and the retiring president, J. M. Macfarlane, gave an address upon *Current Problems in Plant Cytology*. A number of new members were elected. The officers for 1899 were as follows: President, J. M. Macfarlane; first vice-president, G. F.

Atkinson; second vice-president, D. P. Penhallow; secretary and treasurer, W. F. Ganong.

Those for 1900 are: President, D. P. Penhallow; first vice-president, R. Thaxter; second vice-president, E. F. Smith; secretary and treasurer, W. F. Ganong. The next meeting will be held at Baltimore, Md., in connection with the *American Naturalist*.

Journals.—Besides the customary journals, there has appeared a new publication during the past year, entitled *Rhodora*, which is devoted to New England botany. This is published by the New England Botanical Club, a recently established society, and is edited by B. L. Robinson, of the Gray Herbarium, Cambridge, Mass.

Necrology.—W. Nylander, Grant Allen, Charles Naudin, A. W. Chapman, Otto Bückeler, Robert Combs, Karl Müller, R. Yatabe, A. Schmidt, Paolo Much di Palmstein, P. V. A. Feuilleaubeis, T. Caruel, Fr. Gay, C. Flagey, C. Kaurin.

BOTTEGO EXPEDITION. See ZOOLOGICAL LITERATURE (paragraph Special Treatises).

BOULTON, CHARLES ARKOLL, Liberal senator in the Dominion Parliament, was born at Cobourg, Ontario, in 1841; died at Shellmouth, Manitoba, May 18, 1899. He is remembered as one of the Canadians who were sentenced to death by the Riel rebels in 1870. In the second Riel insurrection (1885) he raised and commanded a corps of mounted riflemen known as Boulton's Scouts. He became a senator in 1889.

BOURGEOIS, LÉON VICTOR AUGUSTE, French statesman, born in Paris May 21, 1851; was educated at the Lycée Charlemagne and became a doctor of laws. In 1876 he entered the office of public works, became sous-préfet of Rheims in 1880, and préfet of the department of the Tarn in 1882. For conciliating the miners during a strike at Carmaux he received the decoration of the Legion of Honor. He was appointed préfet of the Haute-Garonne in 1885, and in the following year returned to Paris to the ministry of the interior. In 1887 he became préfet of police, and in 1888 entered the chamber as deputy for the Marne. In 1888-89 he was under-secretary of state to the minister of the interior, and in 1890 he became minister of the interior on the resignation of M. Constans. In the same year he was made minister of public instruction, and he held this post until 1892, when he became minister of justice. In 1895 he tried to form a Radical cabinet, and was prime minister in 1895-96. In 1898 he was made minister of public instruction in the Brisson cabinet, and in 1899 was the head of the delegation from France to the Czar's Peace Conference at The Hague.

BOWDOIN COLLEGE, at Brunswick, Me., was founded in 1794. In his report for the academic year, 1898-99, President Hyde said that in all departments the college was in a healthful and promising condition. The year marked the adoption, in permanent form, of the elective system, toward which the college had been steadily advancing during the past dozen years. During the year five members of the faculty formed clubs, composed of members of their classes, for the discussion in a friendly and informal way of topics connected with their departments, and the influence of these clubs in starting the students in lines of scholarly interest, and connecting college study with the life of the outside world, was found to be of substantial value. The gifts to the library aggregated 884 volumes. For statistics see UNIVERSITIES AND COLLEGES.

BOWEN, SIR GEORGE FERGUSON, British colonial official, died February 21, 1899. He was born in 1821; was educated at Charterhouse and at Trinity College, Oxford, becoming a fellow of Brasenose in 1844. From 1854 to 1859 he was secretary of the British Government in the Ionian Islands, and was associated with Gladstone in the latter's commission appointed to make inquiry into the constitution of the islands. He was governor of Queensland, 1859-68; in the latter year he succeeded Sir George Grey as governor of New Zealand; in 1873 he was transferred to the governorship of Victoria; in 1879, to Mauritius; in 1883, to Hong Kong. In 1887 he retired from active service, but the following year was appointed royal commissioner at Malta to arrange for granting to the island a constitution. In 1886 he became a privy councillor. He wrote *Ithaca*, 1850; *Mt. Athos, Thessaly, and Epirus*, 1852; *Thirty Years of Colonial Government*, 1889.

BOWEN, HERBERT WOLCOTT, United States minister to Persia, was appointed to this position April 18, 1899, to succeed his brother-in-law, Mr. Arthur S. Hardy, transferred to the embassy at Athens. Mr. Bowen is a son of the late Henry C. Bowen, proprietor of the *New York Independent*, and was born in Brooklyn, N. Y., February 29, 1856. He studied at the Brooklyn Polytechnic Institute, in Paris and Berlin, and was a member of the class of 1878 in Yale, but was not graduated. Having been graduated at the Columbia Law School in 1881, he practised law in New York. In 1890 he was appointed by President Harrison consul at Barcelona,

became consul-general under President Cleveland, and was retained by President McKinley, serving until the outbreak of the war in 1898. Mr. Bowen has written: *Verses; In Divers Tones; Losing Ground; De Genere Humano; International Law.*

BOWLING. Bowling on alleys is largely practised in the United States, and the annual tournaments held are innumerable. On February 5 the Greater New York team established a Western record in a match with the Chicago Bowling League by rolling 1039, which they bettered on February 14 by bowling 1045, at Fostoria, O. Rose Murray broke the women's record by rolling 220 pins, February 24, at Toledo; Mrs. Edward Fries bowled 226 pins, a still better record, March 14, at Brooklyn. A telegraphic match was held in January between the Boston Athletic Association (9974) and the Crescent Athletic Club, Brooklyn (9589). The Empire Club, in a Harlem (N. Y. C.) league game, on November 27, scored 1103, which is the competition record since the adoption of the 2-ball game by the American Bowling Congress. Seven players are credited with making the maximum score (300) during the year. The American National Tournament, October 3, 1898, to January 17, 1899, was won by Albion Club, followed by Morningside, Lotus, Fidelia, Arlington, Corinthian, etc.; high scores: Morningside, 1058; Rosedale, 1045; Corinthian, 1030; Bleecker, 1025. The American Bowling Congress met at Brooklyn on January 10, and elected Dr. H. Timm, New York, president; W. V. Thompson, Chicago, vice-president; Samuel Karpf, New York, financial secretary; Thomas Curtis, New York, recording secretary; J. P. Strack, Astoria, N. Y., treasurer.

BOXING AND WRESTLING. The contests to decide the amateur boxing and wrestling championships are annually held under the auspices of the Amateur Athletic Union, which aims to maintain this form of exercise and skill at as high a plane as possible. In 1899 the boxing events were won as follows: 105-pound class, David Watson, Paterson, N. J.; 115 pounds, William Wildner, New West Side A. C., New York; 125 pounds, John Burns, of the same club; 135 pounds, G. Jansen, Pastime A. C., New York; 145 pounds, Percy McIntyre, of the same club; 158 pounds, A. McIntosh, N. W. S. A. C.; heavyweight class, J. B. Knipe, P. A. C. The wrestling contests were won as follows: 105-pound class, W. Nelson, St. George's A. C., New York; 115 pounds, Robert Bonnett, Jr., Turn Verein, Newark, N. J.; 125 pounds, M. Wiley, Rochester A. C., who also won the 135 pounds and the 145 pounds events; 158 pounds, A. Mellinger, St. Bartholomew A. C., New York.

BOYD, ANDREW KENNEDY HUTCHINSON, D.D., LL.D., a prominent clergyman of the Church of Scotland, died March 1, 1899; he was born at Auchinleck, Ayrshire, Scotland, November 3, 1825; was educated at Ayr Academy, King's College (London), and the University of Glasgow. He studied law and became a member of the Middle Temple; then became assistant minister at St. George's, Edinburgh; was minister at Newton-on-Ayr, at Kirkpatrick-Irongray, and at St. Bernard's, Edinburgh. He became first minister of St. Andrew's in 1865. In 1895 he was made a fellow of King's College, London. Dr. Boyd wrote over the pen name A. K. H. B. His published volumes number thirty-two. Among them are: *The Recreations of a Country Parson*, a series of entertaining and humorous essays; *The Critical Essays of a Country Parson*; *The Graver Thoughts of a Country Parson*; *The Commonplace Philosopher in Town and Country*; *Sunday Afternoons at the Parish Church of a University City*; *Twenty-five Years of St. Andrew's*; *St. Andrew's and Elsewhere*; *The Last Years of St. Andrew's*.

BOYD, Colonel DAVID FRENCH, ex-president of the Louisiana State University, died in Baton Rouge, May 27, 1899. He was born in 1835; was graduated at the University of Virginia in 1860, and during the Civil War served in the Confederate army. In 1875 the Khedive of Egypt selected him as superintendent of the Royal Military School at Cairo; subsequently he returned to America and accepted the presidency of the Louisiana State University. Still later he was at the head of military schools in Michigan and Kentucky, and for a time served as president of the Alabama Agricultural and Mechanical College. He returned to the Louisiana University, where at the time of his death he was professor of philosophy.

BOYLE, ROBERT, British major-general, retired, died October 31, 1899. Born July 20, 1823, and educated at private schools, he entered the light infantry in 1841. He participated in the storming of Sepapaqui, and was present at the surrender of forts San Carlos and Castello Viego, Nicaragua, in 1848. Boyle was active in the China war of 1856-58, taking part in the battle of Fatshan, the storming of Canton, and the capture of the Bogue and Taku forts, and of Peiho. He received decorations for various meritorious services, was promoted to major and lieutenant-colonel, was created a C.B., and on his retirement was made a major-general.

BRADFORD, Rev. ARTHUR D., one of the early abolitionists, died in Newcastle,

Penn., January 21, 1899. He was born in 1809, and was a direct descendant of Governor Bradford of Plymouth. Mr. Bradford was United States consul-general at Amoy, China, under President Lincoln. He had travelled widely. Until a few years ago he was a well-known contributor to the leading magazines of this country.

BRANDENBURG, a province of the German Empire, with an area of 15,381 square miles, and a population on December 2, 1895, of 2,821,695, giving a density of 183.5 per square mile. The great majority of the population are Protestants—that is, 2,681,637. The Roman Catholics numbered in 1895, 118,265. The agricultural products include rye, oats, barley, wheat, potatoes, beet-root, and hay. The chief minerals are coal and iron. Among the principal manufactures are tobacco, sugar refining, brewing, distilling, and wine-making.

BRANDES, GEORGE MORRIS COHN, Danish author, born in Copenhagen, February 4, 1842; was educated at the University of Copenhagen, and obtained a degree. He has lived in France, Italy, Germany, Poland, Russia, and Scandinavia, and has published many important works on æsthetics, philosophy, literature, and studies of eminent men of letters. His *Shakspeare* was translated into English by William Archer in 1898, and was received with great favor. His chief work in 1899 was a volume of *Poems*. His principal books are: *Danish Poets; A Study of Ibsen; Lord Beaconsfield; Holberg; Søren Vierkegaard; Impressions of Russia, and Impressions of Poland*.

BRAULT, P. M., French general, who succeeded General Renouard as chief of the general staff November 4, 1898; died September 22, 1899. He was born January 10, 1837, in Louvigné-du-Désert, Mayenne; was educated at the military school of St. Cyr, and became a lieutenant in 1857. He served with distinction in Algeria and Mexico, winning some distinction in the latter country at the battle of Medallino. As a captain he won for himself in 1870 the cross of the Legion of Honor for his services in the battle of Worth. In 1873 he became *chef de bataillon*, and for a time was in Algiers, and participated in the campaign in Tunis. He was promoted to the rank of colonel in 1883, and in 1888 he became a general of brigade and chief of the military cabinet of M. de Freycinet, the minister of war. After the fall of the Freycinet cabinet, Brault was made commander of the eleventh division at Nancy in 1892, and in 1896 became commander of the eleventh army corps at Nantes. In October, 1898, M. de Freycinet again became minister of war, and on the 4th of the following month Brault succeeded General Renouard as chief of the general staff. It is said that M. de Freycinet, who, though a civilian, has twice been minister of war, in large measure owed to Brault his military knowledge.

BRAZIL, a republic of South America, on the Atlantic coast, is bounded on the north, west, and south by every other country of the continent except Ecuador and Chile. The capital is Rio de Janeiro.

Area and Population.—Brazil, the largest country of South America, comprising twenty states and a federal district, has an estimated area of about 3,209,000 square miles, and a population, according to the census of 1890 (recently published), of 14,333,915, but which has since been estimated as high as 17,500,000. The most densely inhabited states are: Sergipe, about 42 inhabitants to a square mile in 1890; Rio de Janeiro, 32.9; Alagoas, 22.1; Pernambuco, 20.7; Ceará, 20; Parahyba, 15.7; and Minas Geraes, 14.3. The most sparsely inhabited state is Matto Grosso, where there is an average of only about one person for each five square miles. Rio de Janeiro, the largest city, was reported to have in 1892, 522,031 inhabitants; the other large cities are Bahia, Pernambuco, Sao Paulo, Pará, Porto Alegre, Ouro Preto, Ceará, Pelotas, and Maranhão. Negroes are numerous in the eastern states, numbering about 2,000,000; the Indians, who number about 400,000, are most numerous in the northern states; and the white population is said to be about equalled by the Mestizos, etc. The population of the seaports is chiefly white. Immigration is encouraged; Chinese and Japanese immigrants are admitted; the total number of immigrants in 1896 was 157,948, of whom over 96,000 were Italians and over 24,000 Portuguese. Brazil is the only Portuguese-speaking country in South America.

Government.—The constitution, dating from February, 1891, vests the chief executive authority in a president, who is elected by popular vote for a term of four years, and is assisted by a cabinet of six members, not responsible to the congress, nominated by him, holding office during his pleasure, and presiding over the following departments: the interior, justice, and public instruction; foreign affairs; finance; war; marine; industry, communications, and public works. The president is not eligible for the ensuing term. He is commander-in-chief of the naval and military forces. The vice-president is elected in the same manner as the president. The chief executive, who was inaugurated November 15, 1898, is Senhor M. F. de Campos Salles; the vice-president is Senhor Rosas e Silva. The legislative power devolves upon a congress of two houses, the senate and the chamber of deputies.

the regular sessions of which begin each year on the 3d of May and continue four months. Each state and the federal district are represented by three senators, who are elected by popular vote for terms of nine years, one-third of the whole number of senators being chosen every third year. There are 212 deputies, elected by popular vote for terms of three years, in the proportion of one for each 70,000 of the population; but no state may have less than four deputies. The states having the largest representation are: Minas Geraes, 37; Bahia and Sao Paulo, each 22; Pernambuco and Rio de Janeiro, each 17; and Rio Grande do Sul, 16. Those having the minimum number four are Amazonas, Espirito Santo, Goyaz, Matto Grosso, Paraná, Piauhy, Rio Grande do Norte, Santa Catharina, and Sergipe. The states, which were formerly the provinces of the empire, maintain their own executive, legislative, and judicial authorities. Import duties, values of postage and other stamp, and bank-note circulation are determined by the federal government; export duties may be fixed by each state. In the states executive and legislative officials are elective, and, except in the case of some city justices, the judiciary is appointive. The administrative authority in the federal district rests with a prefect, appointed by the president of the republic, and a council elected by the citizens of the district. Besides courts of first and second instance, there is at the capital of each state an appellate court and at Rio de Janeiro a supreme tribunal.

Army and Navy.—There is compulsory military service of three years in the active and three in the reserve army. The active army, comprising infantry, cavalry, and artillery, numbered in 1897 about 4000 officers and 24,160 privates. It was reported in 1899 that the national militia was undergoing reorganization. There is a police force of 20,000 men. The composition of the navy is reported as follows: 2 third-class battleships, 2 armorclads, 1 first-class cruiser, 3 second-class cruisers, 2 third-class cruisers, 3 torpedo cruisers, 8 first-class torpedo boats, 6 third-class torpedo boats, 5 river monitors, 1 coast-defence vessel, a number of small cruisers and gunboats and small vedette craft. Some of the more important vessels are: the third class battleships, *Riachuelo*, 5700 tons displacement, and *24 de Maio*, 4950 tons, both built in England, and completed in 1884 and 1885 respectively; the second-class cruiser *Almirante Tamandarc*, 4465 tons and 7500 nominal horse-power, built in Brazil in 1890; the second-class cruiser *Barroso*, 3600 tons, nominal speed 20 knots, launched at Elswick in 1896; the third-class cruiser *Benjamin Constant*, 2750 tons; the armorclads *Marshal Floriano* and *Marshal Deodoro*, recently built at La Seyne; the torpedo cruisers *Tupy*, *Timbira*, and *Tamoyo*, each 1030 tons, recently launched at Kiel. The naval complement numbers about 8900. There are naval arsenals at Rio de Janeiro, Pernambuco, Bahia, Pará, and Ladario de Matto Grosso.

Finance.—The chief items of revenue are import duties, returns from the railways, posts, and telegraphs, and the sale of stamps; the largest expenditures are for the departments of finance, industry, war, marine, and the interior and justice. The ordinary revenue and the expenditure in 1897 were 293,223,000 milreis and 328,974,000 milreis respectively; for 1898 the ordinary revenue was 325,197,123 milreis, and the expenditure 372,812,424 milreis. The budget submitted for 1899 in milreis was: Revenue, 346,164,000, of which 222,000,000 were accredited to import duties; expenditure, 346,000,423, of which 165,924,210 were for the department of finance. The value of customs receipts in milreis has been as follows:

	Import Duties.	Total Customs Receipts.
1897.	223,442,679	244,486,193
1898.	219,823,945	245,909,405

At the close of the year 1897 the total public debt, exclusive of the "Western Minas Loan," amounting to \$17,546,796, was 2,000,277,691 milreis. This debt consisted of the following items, expressed in milreis: Foreign debt, 308,420,444; internal debt, 637,425,600; circulating paper, 439,614,276; bank-notes, 315,344,330; floating debt, 299,473,041. Two additional loans were made to meet the deficits existing at the close of 1897, one of 60,000,000 milreis and the other of 17,824,176 milreis (\$2,000,000). It was reported in the early part of 1899 that President Salles had in a considerable degree strengthened the financial relations of the country, and that Brazil's creditors had agreed to the issuing of funding bonds amounting to \$10,000,000. Nevertheless, financial conditions during the year were not good. This, of course, was due in part to the depreciation of coffee. The congress adjourned on November 22, 1899, without having effected, it was said, any measures for the improvement of the financial and commercial situation.

The reported budgets for 1897 of all the states except Sergipe, Parahyba, and Sao Paulo, have a total revenue of 102,286,000 milreis, and a total expenditure of

101,977,000 milreis; twelve of the budgets showed a surplus, three a deficit, and two balanced. In 1895 the aggregate state debts amounted to 91,706,736 milreis.

The circulating currency is chiefly inconvertible paper; this amounted at the end of 1897 to 712,355,394 milreis, an increase of about 28,653,000 milreis over the circulation of the previous year. Measures were instituted in 1897 for reducing the circulation by withdrawing notes, the rate of withdrawal for that year being 10 per cent.; for 1898, 15 per cent., and for 1899, 20 per cent. The nominal monetary standard of Brazil is gold. The value of the milreis in United States currency is \$0.546.

Industries, Commerce, Etc.—Agriculture is the principal industry and coffee the most important crop. Other prominent products are sugar, tobacco, cotton, Paraguay tea, rubber, cacao, nuts, and timber. The coffee yield, which until recently has been constantly increasing, was estimated to exceed 11,000,000 bags in the year 1897-98, and to be between 8,000,000 and 9,000,000 bags in the year 1898-99. (See the article COFFEE.) Sugar culture is especially important in the state of Pernambuco, and cattle-raising in Rio Grande do Sul; in the latter state also coal is mined, and gold-mining is carried on in Minas Geraes, and less extensively in Bahia, where other metals, including silver, zinc, iron, manganese, copper, and mercury, are found. Iron deposits are particularly rich, but scarcity of proper fuel for smelting prevents any considerable exploitation. In the coast districts there are a number of flourishing manufacturing interests, cotton mills especially being on the increase.

Brazilian commerce is carried on chiefly with Great Britain, the United States, and France. The principal imports include cotton and woollen goods, iron ware, and machinery, flour, coal, cattle, jerked beef and other provisions, timber, and alcoholic liquors. The values in milreis of the leading exports in 1897 were: Coffee, 599,190,115; rubber, 149,691,325; tobacco, 23,941,821; hides, 13,427,229; cacao, 12,757,957. The annual rubber export of the Amazon basin is enormous, notwithstanding the sparse population of this region. The Brazilian export of this article was reported at 25,036,628 pounds in 1897, 22,200,332 pounds in 1898, and 18,227,500 pounds up to September, 1899.

In 1898 the merchant marine comprised 229 steamers and 344 sailing vessels of 94,262 tons net and 88,000 tons net respectively. The coasting trade in 1897 was carried on by 212 steamers and 388 sailing vessels of 70,680 tons and 26,637 tons respectively. The foreign shipping entered at the principal ports in 1897 was: 1274 vessels, 2,146,834 tons; Pernambuco, 948 vessels, 1,145,706 tons; Rio Grande do Sul, 474 vessels, 249,145 tons; Paranagua, 429 vessels, 227,713 tons; Ceará, 285 vessels, 258,368 tons; Rio Grande do Norte, 241 vessels, 51,763 tons; Parahyba, 194 vessels, 185,488 tons; Maranhao, 189 vessels, 260,443 tons. The coffee-shipping cities in the order of their importance as such are Santos, Rio de Janeiro, Victoria, Bahia, Ceará.

Communications.—Vast areas of the interior of Brazil are not only unsettled, but are practically unexplored; even where in those regions small settlements have been made regular roads are almost non-existent. In the less sparsely inhabited districts, however, railways have been constructed to a considerable extent, Brazil ranking eighth for railway mileage among the countries of the world. In 1899 this mileage was reported at 8722 miles (14,035 kilometres), the greatest mileage of any Latin-American country except Argentina, and many miles of line were in process of construction. Some of the railways are owned by the government and some by private companies; most of the latter lines are guaranteed by the government interest at 6 or 7 per cent. on the capital invested. The telegraph system, which is controlled by the government, and the expenditure of which is between two and three times the revenue, comprised in 1895 10,143 miles of line, and 21,936 miles of wire, with 289 offices.

Religion and Education.—The Roman Catholic is the dominant religion, but though the government grants appropriations for the functionaries of this church, all other faiths receive full toleration. In 1890 there were about 14,179,600 Catholics and 143,700 Protestants in the country. In the Roman Catholic system Brazil comprises an ecclesiastical province.

Education is in a very backward condition, 84 per cent. of the population, it is reported, being illiterate. Even approximately accurate data on public instruction in the states are unobtainable even by the federal government, but in 1889 it was officially stated that the public and private primary schools numbered about 7500, with an attendance of about 300,000 pupils. Educational facilities in the various states present great dissimilarities, but in general there may be said to be three grades of public instruction—primary, secondary, and higher. The first, which is free, is under the control of state and municipal authorities. Secondary instruction is chiefly private, but some schools are controlled by the states and two by the federal government. Under control of the latter also is the higher instruction, represented by two schools of law, each with 23 instructors, at Sao Paulo and Pernam-

buco; two of medicine and pharmacy, each with 29 instructors, at Rio de Janeiro and Bahia; a school of mines, a polytechnic, four military schools, one naval school, and a lyceum of arts and trades. The last named had in 1890, 2277 students, and the others 2916. Besides these, there were about 575 students attending other special schools. There are 11 seminaries for the private instruction of the clergy; all public instruction, however, is under lay management. Not anywhere in the country is education compulsory.

Cruise of the *Wilmington*.—In the spring of 1899, after a long voyage into the interior of Venezuela on the Orinoco River, the United States gunboat *Wilmington*, commanded by Captain A. S. Crowninshield, made a similar cruise up the Amazon. The chief object of these trips was to show the United States flag in ports where it is scarcely ever seen, cultivate friendly relations with the inhabitants, stimulate American trade, and ascertain new facts concerning these little-known regions. By April 4 the *Wilmington* had reached Manaos, a young and prosperous city of about 20,000 inhabitants, 1000 miles from the mouth of the Amazon. The vessel then proceeded about 1500 miles farther, going up the Solimoes to Iquitos, Peru.

Revolt in Amazonas.—In the summer of 1899 an attempted revolution occurred against the Brazilian government in upper Amazonas. The inhabitants of this district attempted to set up an independent state, with a republican form of government, but the movement amounted to little, and by the last of August was no longer considered serious. It was condemned by the congress of the state of Amazonas as "misguided."

The Guiana Boundary.—For some time there has been a dispute between Brazil and France concerning the Guiana boundary line. The trouble, however, did not arise until after the discovery of gold in 1894 in what is now the disputed territory. On the 15th of August, 1897, the two governments signed a treaty submitting the question to arbitration, and on December 6, 1899, chose the Swiss government as arbitrator. The contention of Brazil is for the possession of a district that has been considered a part of Guiana. The documents are voluminous, the statement of Brazil comprising four volumes and an atlas, and the reply of France one volume and three maps. On February 21, 1899, a conflict occurred between the escorts of the commissioners sent out by France and Brazil to explore the boundary region.

BREMA, MARIE, opera-singer, born in Liverpool, England, about 1855. She first appeared at the Monday Popular Concerts, in London, in 1890, and sang the title rôle of Glück's *Orpo*, and Lola in *Cavalleria Rusticana* in 1891 in London. Her voice is a mezzo-soprano of much volume, and she has devoted herself to Wagnerian rôles. She has sung Ortrud, Fricaka, and Kundry at Bayreuth. Brema first appeared in the United States as Brangäne with the Damrosch Opera in 1895. She sang in America and London with the Grau Opera in 1899.

BREMEN, a state and free city on the Weser, about fifty miles from its mouth, with a population on December 2, 1897, of 202,465. It is one of the chief ports of Germany, and one of the chief outlets of emigration. In respect to international trade it ranks next to Hamburg, and its trade is with not only European countries, but with the United States, West Indies, Africa, East Indies, China, and Australia. Its commerce has steadily increased since 1894. The value of imports in millions of marks from 1894-97 inclusive was as follows: 1894, 694; 1895, 806; 1896, 821; 1897, 894; and of its exports during the same period 1894, 672; 1895, 766; 1896, 809; 1897, 852. The value of a mark in United States currency is 23.8 cents in gold. The largest share of the imports in 1897 were from the German Empire, but the United States supplied nearly as much. As to the exports, the largest fraction went to the German Empire, and the next largest to the United States. By far the greatest portion of the imports came by sea, while the larger portion of the exports were shipped by land and by river steamers. The merchant marine on January 1, 1898, numbered 473 sea-going vessels, including 242 steamers.

BRICKS. See CLAY.

BRIDGES. Bridge building was active during 1899, but the new work consisted largely of numerous small structures, few new bridges of great size being placed under construction. In this bridge work the tendency of the last few years toward better shop work, riveted connections, solid floors, and generally heavier and more durable construction was continued. During the year American bridge builders increased materially their operations in foreign countries. Several shipments of railway bridges were sent to Russia, Africa, Japan, and the South American countries. The most advertised of these foreign contracts was the bridge built by the Pencoyd Iron Works, of Philadelphia, Penn., for the extension of the military railway into the Soudan by the British War Department. This bridge consisted of seven 147-foot spans, weighing altogether 800 tons, and it was con-

structed ready for shipment in thirty-two days from the date the contract was closed. See EGYPT.

Substantial progress was made on the New East River Bridge at New York City during 1899. At the end of the year preparations were under way for erecting the steel towers which will carry the suspension cables. Specifications were prepared during the year for these cables. As specified, there will be four cables, each 17½ inches in diameter and each composed of 37 parallel strands of 287 wires each, a total of 10,397 wires in each. These wires will be 0.165 inches in diameter, and will be of steel having an ultimate tensile strength of 200,000 pounds per square inch. Each cable when completed will be covered with a removable cylindrical steel plate armor to protect it from the weather. Besides the work on the new East River Bridge two other East River bridges were placed under way during the year. One of these was a suspension bridge, located about a quarter of a mile above the present Brooklyn Bridge, with a centre span of 1447 feet and two shore spans of 970 feet each, and the other was a cantilever bridge crossing the river at Blackwell's Island, with five spans, the longest of which is 1050 feet. The preliminary surveys and location were completed for these bridges, and the sum of \$50,000 each was appropriated for making borings for the foundations. The New York Municipal Assembly on December 30 approved the construction of both bridges, and appropriated \$1,000,000 for beginning work on the suspension structure. During the year the Lewiston and Queenston Suspension Bridge across the Niagara River, which was begun in 1898, was completed and opened for traffic. This bridge has a span of 800 feet between the rocker bents carrying the ends of the stiffening trusses. The width of the roadway between trusses is 28 feet. This bridge was built chiefly for an electric railway line, but it will also carry highway traffic.

In drawbridge construction the bascule bridge over the Fort Point Channel, Boston, and the Charlestown Bridge in the same city are the most notable examples of 1899. The Fort Point Channel Bridge was built to carry the six tracks of the New York, New Haven and Hartford Railroad into the Boston South Terminal Station. The span of this bridge is 83 ft. 8¼ in. Another bridge of the same type was planned to cross the Chicago drainage canal at Campbell Avenue, Chicago, Ill. This bridge will carry eight railway tracks and will have an open span of 150 feet. The Charlestown bridge at Boston is a swing span, 240 feet long, which is chiefly notable for its great width of 100 feet.

In masonry bridges the most notable feature of the work of 1899, as of 1898 and the few years previous, was the increasing use of concrete and imbedded metal skeleton arches, and in Europe of masonry arches with hinges of stone or metal. None of the new constructions of this class have been of unusual character.

BRIDGMAN, FREDERICK ARTHUR, American painter, born in Tuskegee, Ala., November 10, 1847. After studying in Brooklyn and New York, he went to Paris and became a pupil of Gérôme. From 1866 till 1871 he studied in the École des Beaux Arts. His studio is in Paris, but he occasionally visits America. An exhibition of his works attracted much attention in New York in 1899. His subjects are chiefly Oriental and archaeological. See PAINTING.

BRIGGS, the Rev. CHARLES AUGUSTUS, D.D., LL.D., formerly professor of Hebrew and cognate languages and now occupying the chair of biblical theology in Union Theological Seminary, New York, was born in New York City in 1841. He was pastor of the Presbyterian church at Roselle, N. J., from 1869 to 1874, and has held since 1874 a professorship in the Union Theological Seminary. His inaugural address upon taking the chair of biblical theology in 1891 contained statements respecting the Bible, inspiration, and the place of reason in religion, which were voted heretical by the Presbytery of New York. Later, the General Assembly of the Presbyterian Church formally disapproved his appointment to the seminary, and in 1893 he was suspended from the ministry of the church, but the seminary refused to remove him from its faculty. The controversy thus occasioned in religious circles was revived in 1899 by the application of Dr. Briggs for membership in the Protestant Episcopal Church and later his ordination to the priesthood of that denomination. His admission to the church was vigorously opposed by a number of prominent churchmen, who disapproved of his views on biblical criticism, but he was supported, on the other hand, by Bishop Potter and by other well-known members of the clergy, and was ordained on May 14. Among the published writings of Dr. Briggs are: *The Higher Criticism of the Hexateuch*, 1893; *The Messiah of the Gospels*, 1894, and *Biblical Study*, 1895. The first-named work was also published in 1897 in a new and revised form. He wrote, also, *The Bible, the Church, and the Reason: Whither?* In 1899 was published his *General Introduction to the Study of Holy Scripture*.

BRIGHT, the Right Hon. JACOB, who died November 8, 1899, was a privy councillor and a member of the English Parliament for nearly thirty years and a brother

of the statesman, orator, and exponent of free trade, John Bright. His career was similar to that of his brother, and he probably would have been better known as a public man had he not been overshadowed by the fame of John Bright. His best efforts were put forth in the cause of ameliorating the condition of woman and improving her legal status. He gave great attention and support to all efforts for the improvement of woman's position as regards property rights and legal, civil, and political disabilities. Much of the legislation which has placed the legal status of women in Great Britain on a firmer basis was introduced by him, and he was prominent in bringing about the extension to women, in 1869, of the right of municipal voting. His ideas on woman suffrage were radical, and it was his opinion that women should vote for members of Parliament. Mr. Bright was chairman of the firm of John Bright and Brothers, of Rochdale, and a director of the Manchester ship canal. He was one of the founders of the Reform clubs of London and Manchester and a member of the National Liberal Club. He was born in 1821.

BRINTON, DANIEL GARRISON, a celebrated ethnologist and anthropologist and professor of American archaeology and linguistics in the University of Pennsylvania, died at Atlantic City, July 31, 1899. He was born in Thorndale, Penn., May 13, 1837. After his graduation at Yale in 1858, he entered the Jefferson Medical College, where he graduated in 1861. He then studied in Paris and Heidelberg, and, returning to the United States, entered the Union volunteer army, in which from 1862 to 1865 he rendered valuable service as assistant surgeon, surgeon, and finally medical director of the Eleventh Army Corps. He was honorably discharged with the rank of brevet lieutenant-colonel. From 1867 to 1887 he was editor of the *Medical and Surgical Reporter*. He became professor of ethnology at the Philadelphia Academy of Natural Sciences, and in 1886 accepted a call to the chair of American archaeology and linguistics in the University of Pennsylvania. In 1894 Professor Brinton was president of the American Association for the Advancement of Science. His work in the field of American-Indian literature is very important. He attained valuable results from his study of primitive religions, collecting facts, by which he traced the evolution of religious beliefs. Not long before his death he gave his books and manuscripts relating to the aboriginal languages of North and South America to the University of Pennsylvania. He edited the *Library of Aboriginal American Literature*. It is stated that in the Boston Public Library there are over eighty works either written or edited by him. Among his works are: *The Myths of the New World*, 1868; *The Religious Sentiment*; *The Iroquois Book of Rites*, 1883; *American Hero-Myths*; *Chronicles of the Mayas*; *The Lenâpé and their Legends*; *Races and Peoples*, 1890; *The American Race*, 1892; *The Pursuit of Happiness*; *Nagualism*; *Primer of Mayan Hieroglyphics*, 1896; *Lectures on the Religions of Primitive Peoples*.

BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE, founded 1831, is composed of the following sections: A, mathematics and physics; B, chemistry; C, geology; D, zoology; E, geography; F, economic science and statistics; G, mechanics; H, anthropology; I, physiology, and K, botany. The 1899 meeting of the association, held in September, at Dover, with Sir Michael Foster in the chair, was attended by some fourteen hundred persons and was visited by delegations from two French scientific societies. Among the more important papers was that read in the geological section by R. Etheridge, F.R.S., showing that the recently discovered coal fields in Kent pointed toward the existence of a series of coal basins between Belgium and England; and in the mechanical section that of Sir William White upon naval architecture. The meeting in 1900 will be in Bradford and in 1901 in Glasgow. Secretary, G. Griffith, M.A., Burlington House, W. London, England. For an account of the anthropological expedition to Torres Strait, presented at the Dover meeting of the British Association, see **PSYCHOLOGY** (paragraph *Psychology in Europe*). See also **ZOOLOGICAL SOCIETIES**.

BRITISH CENTRAL AFRICA is the name applied to that portion of Rhodesia between the Zambesi on the south and German East Africa and the Congo Free State on the north, Portuguese East Africa on the east, and Angola on the west. This territory, with the exception of the British Central Africa Protectorate, is under the jurisdiction of the South Africa Company, and officially known under the title of Northern Rhodesia. The area is estimated at 251,000 square miles and the population at 650,000. The headquarters of the government, which have hitherto been at Blantyre, have been transferred to the Tanganyika plateau. A large part of the territory is uninhabited and the Europeans are very few in number. The products include wheat, European fruits, and coffee. Gold has been found in the southern portion. The western part is the most populous and the best adapted for cultivation. Rice, wheat, oats, coffee, and rubber are said to thrive in that region. There is communication with British Central Africa by way of Lake

Nyassa, and there is a telegraph line in process of construction along the western shore of Lake Tanganyika.

BRITISH CENTRAL AFRICA PROTECTORATE lies to the east of British Central Africa or Northern Rhodesia, and extends along the western and southern shores of Lake Nyassa in the direction of the Zambesi. It has an area of 42,217 square miles, with a population estimated in 1897 at 844,995 natives and 300 Europeans. Great progress has been made in the cultivation of rice, wheat, and coffee in recent years. Oats and barley are raised in the uplands and there is excellent pasturage for sheep. The exports include ivory and coffee, and the imports cotton goods, machinery, provisions, hardware, and agricultural implements. The steamers on Lake Nyassa afford communication with the outside world. There is a telegraph line through the protectorate to Tanganyika in process of construction which will connect Blantyre, the chief town of the protectorate, with Zomba, Salisbury, and Cape Town. A railway from Buluwayo to the Zambesi was undertaken in 1899. Blantyre has a population of about 6000 natives and 100 Europeans. Zomba is the headquarters of the administration. The exports in 1898-99 amounted to £37,964; the imports, exclusive of specie, to £108,383. There are gunboats and steamers on Lake Nyassa and also on the upper and lower Shiré River. This territory was proclaimed a protectorate in 1891 and is directly administered by the British Foreign Office through a commissioner.

BRITISH COLUMBIA. See COLUMBIA, BRITISH.

BRITISH GUIANA, a colony of Great Britain in South America, comprising the settlements of Berbice, Essequibo, and Demerara, is bounded on the north by the Atlantic Ocean, on the east by Dutch Guiana, on the south by Brazil, and on the west by Brazil and Venezuela. The area, including the Venezuelan claim up to the "Schomburgk" line, is 109,000 square miles. (For the settlement of the Venezuelan-British boundary dispute, see **VENEZUELA**, paragraph History.) The population in 1898 was estimated to be 286,484, nearly one-half of whom are engaged in agriculture; about one-third of the population are negroes and another third East Indians. The capital is Georgetown, population (1891) 53,176. The government consists of a British governor, a court of policy of seven official and eight elective members, and a combined court, comprising, together with the court of policy, six elective financial representatives. The governor in 1899 was Sir Walter J. Sendall. In 1896-97, 209 schools, having about 28,300 pupils, received government aid amounting to \$101,617. The principal sources of revenue are customs and licenses; the leading expenditures are for administration, church, judiciary, education, and public works. Statistics of finance and trade for fiscal years have been as follows:

	Revenue.	Expenditure.	Imports.	Exports.
1896-97.	\$2,652,802	\$2,873,937	\$6,528,760	\$9,242,757
1897-98. . . .	2,450,025	2,737,601	6,242,961	8,690,795
1898-99. . . .	2,558,859	2,556,533	6,673,291	8,140,881

The public debt in 1897-98 was \$4,617,790; in 1898-99, \$4,748,201.

Sugar is the principal product and export, about seven-eighths of the land under cultivation being given to it. Some of the leading exports for the fiscal year 1897-98 were valued as follows: Sugar, \$4,080,462; rum, \$645,163; balata, \$150,636; rice, \$104,059; in 1898-99: sugar, \$5,065,418; timber, \$1,218,753; rum, \$704,168; molasses, \$58,236. The country has rich gold deposits; the output for the fiscal year 1897 was 126,702 ounces; for 1898, 125,080 ounces, valued when exported at \$2,220,977; for 1899, 112,264 ounces, value \$2,016,699.

The chief imports in order of their values are: Textiles, flour, rice, machinery, manures, fish, coal, hardware. More than one-half of the foreign trade is with Great Britain. The merchant marine in 1898 consisted of 132 vessels (16 steam, 116 sail) of 6303 tons. The total arrivals and clearances at the ports in 1897-98 aggregated 621,198 tons. Unlike the South American republics, British Guiana has good roads, which, with 450 miles of navigable rivers, make transportation fairly easy. There are about 40 miles of railway, about 546 miles of telegraph lines, and 70 post-offices.

BRITISH HONDURAS, or BALIZE, a crown colony of Great Britain on the Caribbean Sea, east of Guatemala and south of Yucatan, has an area of 7562 square miles and an estimated population (1897) of 34,277, of whom about 33,800 are colored. The seat of government is Balize, with about 7000 inhabitants. The colony is administered by a governor, an executive council, and a legislative council. The chief item of revenue is customs duties and of expenditure administration. The revenue and expenditure for 1896 were \$302,686 and \$269,877 respec-

tively; for 1897, \$314,017 and \$322,990 respectively; for 1898, revenue \$274,690, expenditure \$301,413. The government debt in 1898 was \$168,815. The principal exports are mahogany, logwood, sugar, and fruit. In 1896 the exports were valued at \$1,378,601 and the imports at \$1,462,637; in 1897 the exports and imports amounted to \$1,404,387 and \$1,422,097 respectively. Great Britain receives about one-half of the exports and sends about one-third of the imports. The total mahogany export in 1897 was 6,777.382 superficial feet; in 1898, 7,630,252 feet. In the latter year 23,579 tons of logwood were exported. The colonial merchant marine in 1898 comprised 5 steamers of 748 tons and 220 sailing vessels of 4906 tons; arrivals and clearances in 1897 aggregated 194,144 tons and 196,189 tons respectively. The total imports in 1898 amounted to \$1,248,910; domestic exports amounted to \$955,264 and transit exports \$327,329—total, \$1,282,593. Of the trade for 1898 imports valued at \$420,127 came from Great Britain, and exports valued at \$853,193 went to that country. Internal communication at present is effected only by canoe and horseback; but in the summer of 1899 a line of railway to cost about £75,000 (\$364,950) was proposed. The road if built will run inland from the city of Balize and efforts will be made to build an extension to a place at or near La Libertad or Flores in the Guatemalan province of Peten. Besides subsidiary silver amounting to about \$200,000, there are in circulation nearly \$120,000 in government notes. The monetary standard of value since October, 1894, has been the United States gold dollar.

BRITISH MUSEUM, founded in 1753 and first opened to the public in 1759, is now open to visitors every week-day and on Sunday afternoons; occupies buildings in Bloomsbury, London. The manuscript department contains more than 55,000 volumes and ancient papyri, seals, and charters. In the printed book department are about 2,000,000 volumes. A copy of every copyrighted book published in the United Kingdom is deposited there. It is expected that the new catalogue in 600 parts, which is to replace the old catalogue of 3000 manuscript volumes, will be completed in 1900. There are, besides the departments already mentioned, the oriental printed books and manuscripts department, the antiquities department, containing Greek and Roman, Egyptian, Assyrian, British, and mediæval antiquities, and a department for prints and drawings. The annual number of visitors to the museum, according to the latest report, was 612,275, and those to the reading room numbered 190,886.

BRITISH NORTH BORNEO. See BORNEO.

BROOKLYN INSTITUTE OF ARTS AND SCIENCES, organized in 1824, had in 1899 a membership of 5824, but the 26 different departments show for the academic year 1898-99 a membership of 10,061. There is a library of 2700 volumes. During 1899, 9 courses of general lectures were given, besides 572 lectures in the regular departments, and 11 exhibitions were given. The Institute has the museum building partly built, a building in Bedford Park, the art building on Montague Street, a biological laboratory at Cold Spring, L. I., and the Westhampton summer school of art. The year's income was \$119,965. A school of pedagogy was established with 5 classes and an enrolment of 522 students, and a gift of \$10,000 was received for the purchase of an entomological collection. The total attendance at lectures, concerts, and other exercises was 360,980. President of Board of Trustees, A. Augustus Healy; secretary, George C. Brackett, Brooklyn.

BROWN UNIVERSITY, at Providence, R. I., was chartered in 1764. The most important event in its year's history was the selection and inauguration of its new president, the Rev. William H. P. Faunce, A.M., D.D., for the past eight years pastor of the Fifth Avenue Baptist Church, New York City. While the number of students was larger than ever before, the teaching force was somewhat less than during the preceding year. The movement to increase the endowment fund of the university by the sum of \$2,000,000 was carried forward with encouraging results, John D. Rockefeller having given \$250,000 toward it. Among the most noteworthy gifts of the year was a fund of \$10,000 for books on mediæval and church history, given by Mrs. Alice M. Sullivan, daughter of the late Joseph Banigan. Gifts to the library amounted to 2270 volumes; total additions, 4180 volumes. In the women's college there were 165 students and classes were conducted in 28 subjects. Wilfred W. Munro resigned his office as director of the university extension, being convinced after eight years' experience that the scheme was impracticable. On February 9 a fire did great damage to Maxcy Hall, and three days later another fire occurred in Lyon Hall. For statistics see UNIVERSITIES AND COLLEGES. See also PSYCHOLOGY, EXPERIMENTAL.

BRUCE, Rev. ALEXANDER BALMAIN, D.D., professor of apologetics and New Testament exegesis in Free Church College, Glasgow, died August 7, 1899. He

was born in Perthshire January 30, 1831; was educated at the University of Edinburgh, and from 1859 to 1875 was a minister of the Free Church of Scotland. In the latter year he was the Cunningham lecturer in connection with the Free Church, and was called to his professorship in Glasgow. In 1886 he was the Ely lecturer at Union Theological Seminary, New York, and in 1896-98 was the Gifford lecturer at the University of Glasgow. Dr. Bruce wrote: *The Training of the Twelve*, 1871; *The Humiliation of Christ*, 1876; *The Chief End of Revelation*, 1881; *The Parabolic Teaching of Christ*, 1882; *The Galilean Gospel*, 1882; *The Miraculous Element in the Gospels*, 1886; *Life of William Denny*, 1888; *The Kingdom of God*, 1889; *Apologetics, or Christianity Defensively Stated*, 1892; *St. Paul's Conception of Christianity*, 1894; *A Critical Commentary on the Synoptical Gospels*, 1896; *With Open Face, or Christ Mirrored in the Gospels*, 1896; *The Providential Order of the World*, 1897.

BRUCE, Lieutenant-General Sir HENRY LE GEYT, K.C.B., died April 15, 1899. Born in 1824 and educated at King's School, Canterbury, he entered the Bengal Artillery in 1842. The next year he served at Gwalior, at Sutlej, in 1846, and in the Punjab in 1848; in 1855 he served on the northwest frontier and took part against the Indian mutiny in 1857-58. Bruce was promoted to the rank of lieutenant-general in 1874. He was created a C.B. in 1874 and a K.C.B. in 1897.

BRUMBY, Lieutenant THOMAS MASON, U.S.N., brought into prominence lately as the flag officer and friend of Admiral Dewey, at Manila, died December 17, 1899. Brumby had been recommended for advance by some numbers on the list of lieutenants, and would thereby have reached in less than a year the rank of lieutenant commander. His death was the third of those closely associated with Dewey in the battle of Manila—namely, Captain Gridley, Commander Wood, and Lieutenant Brumby. Brumby was presented with a sword on October 26 by the legislature of Georgia. He graduated from the Naval Academy in 1879; became junior lieutenant in 1887 and lieutenant in 1892. He was stationed at Samoa during the notable hurricane of March, 1889. When the then Commodore Dewey was assigned to the command of the Asiatic squadron he chose Lieutenant Brumby, then at Washington, as his flag officer. Brumby became noted as the man who, on the surrender of Manila, on August 13, 1898, raised the American flag over the city.

BRUNEL. See BORNEO.

BRUNSWICK, DUCHY OF, a northern state of the German Empire, with an area of 1424 English square miles and a population on December 2, 1895, of 434,213, of whom the Roman Catholics numbered 19,508, nearly all the rest belonging to the Lutheran Church. The capital is Brunswick, with a population in 1895 of 115,138. The chief crops are oats, wheat, rye, and beet-root. The mineral products, including salt, are obtained in considerable quantities. At the beginning of 1898 the public debt amounted to 26,977,407 marks (the mark, in United States gold, being between 23 and 24 cents). The budget estimate for 1898-99 was 14,745,000 marks. The constitution dates from 1832, but has undergone two important modifications by the fundamental laws of 1851 and 1888. There is a legislature, consisting of one chamber of 46 members and meeting every two years. The executive authority is vested in the duke (Prince Albrecht in 1899) and in a responsible ministry of state, consisting of three departments—namely, state, foreign affairs, and finance; justice and ecclesiastical affairs, and the interior. In 1899 there was a reform of the electoral law, by which the legislative body should consist of 48 deputies. There were also changes made in the tax laws.

BRYAN, WILLIAM JENNINGS, who was regarded in 1899 as the probable Democratic candidate in the next Presidential election, continued his work of lecturing and speaking in the cause of bimetalism and against trusts and colonial expansion during the year. He was born in Salem, Ill., March 19, 1860, and graduated at the Illinois College (Jacksonville) in 1881 and at the Union College of Law (Chicago) in 1883. After practising in Jacksonville, he removed to Lincoln, Neb. In 1891-95 he served in Congress, and in 1894 received the nomination for United States Senator but was defeated. In 1896 he was a delegate to the National Democratic Convention, made a notable speech, and received his nomination for President. He was editor of the Omaha *World-Herald* in 1894-96, and has subsequently contributed many articles to magazines and newspapers. In May, 1898, he raised the Third Regiment of the Nebraska volunteer infantry and served as its colonel.

BUBERL, CASPER, one of the most prominent sculptors in America, died at his home in New York, August 22, 1899, in about his seventieth year. He was born in Bohemia, studied art in Vienna, and a few years before the Civil War came to the United States. Among some of his well-known works are the bas-reliefs on the

Garfield monument in Cleveland; the figure of Columbia in front of the Congressional Library in Washington; the bronze statue in Alexandria, Va., symbolical of the "lost cause"; the allegorical groups of the patent office, Washington; the Ponce de Leon statue, created for the Venezuelan republic. Just before his death he was engaged upon works designed for the triumphal arch which was erected on Fifth Avenue, at Twenty-fourth Street, New York, in celebration of Admiral Dewey's return and the victories of the Spanish-American war.

BUBONIC PLAGUE. See PLAGUE.

BÜCHNER, FRIEDRICH KARL CHRISTIAN, celebrated German materialistic philosopher, was born in Darmstadt, March 28, 1824, and died there May 1, 1899. He studied in Giessen, Strasburg, Würzburg, and Vienna, and having graduated in medicine, practised his profession for a time in his native city. In 1852 he was appointed a lecturer at Tübingen, which position he was forced to resign on account of the philosophical doctrine set forth in his *Kraft und Stoff*, published in 1855. He thereupon resumed his medical practice in Darmstadt. Among Büchner's subsequent works are the following: *Aus Natur und Wissenschaft*, 1874; *Natur und Geist*, 1876; *Aus dem Geistesleben der Tiere*, 1880; *Licht und Leben*, 1881; *Die Macht der Vererbung*, 1882; *Der Fortschritt in Natur und Geschichte im Licht der Darwinischen Theorie*, 1884; *Liebe und Liebesleben in der Tierwelt*, 1885; *Thatsachen und Theorien aus dem naturwissenschaftlichen Leben der Gegenwart*, 1887; *Das künftige Leben und die Moderne Wissenschaft*, 1899; *Fremdes und Eigenes aus dem geistigen Leben der Gegenwart*, 1890; *Zwei gekrönte Freidenker*, 1890; *Das goldene Zeitalter oder das Leben vor der Geschichte*, 1891; *Das Buch vom langen Leben oder die Lehren von der Dauer und Erhaltung des Leben*, 1892. Büchner's materialistic philosophy has had wide influence. His *Kraft und Stoff* has passed through seventeen German editions and has appeared in numerous editions in thirteen other languages. Philosophically considered, the book is not one of great merit. Its popularity is probably due to the fact that it contains a large amount of scientific knowledge, non-technically phrased, and that with the air of standing for truth and justice, it attacks creeds and the church. In it he promulgated the doctrines of the indestructibility of force and matter—doctrines now generally accepted—and also that nothing beyond physical force is known to man, that neither God nor ends exist in nature, and that man has no soul endowed with immortality and freedom. Later he insisted on the infinity of forms of being and the co-existence of light and life. The difficulty that goes so far to invalidate *Kraft und Stoff* as a work of sound philosophy is the same difficulty that has baffled so many other writers in their attempts to found an *à posteriori* philosophy upon the laws of the physical world. The trouble lies in the conception of mind from the materialistic point of view. Büchner may with fairness be judged by *Kraft und Stoff*, as the last German edition appeared as late as 1892. With regard to the above-mentioned difficulty of this book, Professor Friedrich Paulsen says: "There are three kinds of conceptions concerning the relation of thought and movement, which are tangled into an inextricable snarl: 1. Thought is motion; 2. Thought is the *effect* of motion; 3. Thought is indissolubly *connected* with motion. 'Thought and extension can be regarded only as two aspects of one and the same unitary being' (p. 300), the real nature of which is as yet unknown to us (pp. 3, 316). *Influxus physicus*, Parallelism, Identity, and the popular conceptions, Spinoza, Kant—all these stagger around like drunkards." The work of Büchner, however, has its good results. It has made clearer and more prominent in the popular mind a knowledge of the laws of nature; and through both its truthfulness and its error it has inspired philosophical thought that is setting in the right direction. Büchner was a brother of Georg Büchner, the poet, of Luise Büchner, the novelist, and of Alexander Büchner, the literary historian.

BUCKALEW, CHARLES R., formerly United States Senator from Pennsylvania, died in Bloomsbury, Penn., May 19, 1899. He was born in Columbia County, Penn., December 28, 1821; received an academic education, studied law, and was admitted to practice in 1843. In 1845-47 he was prosecuting attorney of Columbia County. From 1850 to 1858 he served as State senator, and was appointed in 1857 to revise the penal code. The following year he was appointed minister to Ecuador, where he served till 1863. From this year until 1869 he represented Pennsylvania in the federal Senate. In 1869 he was again elected state senator, and in 1872 was the Democratic candidate for governor. He was a member of Congress from 1887 to 1891, representing, as a Democrat, the seventeenth district of his State in the Fiftyeth and Fifty-first Congresses. He wrote *Proportional Representation* and *An Examination of the Constitution of Pennsylvania*.

BUCKWHEAT. The following table, published by the department of agriculture, division of statistics, shows the acreage, production, and value of buckwheat in the United States in 1899:

STATES AND TERRITORIES.	Acreage.	Average yield per acre.	Production.	Average farm price Dec. 1.	Farm value Dec. 1.
	<i>Acres.</i>	<i>Bushels.</i>	<i>Bushels.</i>	<i>Cents.</i>	<i>Dollars.</i>

BUILDING STONE. The value of the building stone produced in 1898 was as follows:

Granite.....	\$9,324,406
Marble.....	3,629,940
Slate.....	3,723,540
Sandstone.....	4,724,412
Limestone.....	16,039,056
Bluestone.....	1,000,000
Total.....	\$38,441,354

This shows a gain of \$2,000,000 over the value produced in 1897. The increase in the production of granite was chiefly due to the States of Connecticut, New Hampshire, New Jersey, New York, and Vermont. A new discovery of marble has been reported from the headwaters of the Qualala River in California. The nineteenth annual report of the United States Geological Survey contains a most detailed article by T. N. Dale on the slate belt of eastern New York and western Vermont, the work being a chemical, petrographical, and geological study of the slate belt on the border of New York and Vermont, and one of the most elaborate pieces of work ever done in this line. Among the recent works dealing with this subject are a report on the building stones of Wisconsin by E. H. Buckley, and a German work by Herrmann, entitled *Die Steinbruchindustrie und Steinbruchgeologie*. This latter is one of the most valuable works on the subject that has ever appeared. See MARBLE.

BULGARIA, a state of the Balkan Peninsula, tributary to the Sultan of Turkey, but since the treaty of Berlin in 1878 possessing autonomy. Including eastern Roumelia, which was incorporated with it in 1885, under the name of South Bulgaria, the area is 37,560 square miles and the population on January 1, 1893, was 3,370,713, of which 2,504,336 were Bulgarians, 569,729 Turks, and the remainder, in the order of their numerical importance, were Roumanians, Greeks, Gypsies, Jews, Tartars, Armenians, Germans, Austrians, Russians, etc. In 1895 the estimated population was 3,376,467. The capital is Sofia, with a population in 1893 of about 47,000. Agriculture is the chief occupation. The soil is fertile and 25½ per cent. consists of arable land and market garden; about 48 per cent. of pasture. The majority of the agricultural classes are small proprietors holding from one to six acres. Wheat is the chief crop, and is largely exported. The other crops include wine, tobacco, and silk. Stock-raising is an important occupation. The state owns the minerals and works the coal mines at Pernik. The manufactures include woollens, cottons, cord, cigars, and cigarettes. The foreign trade is considerable, but is chiefly confined to European countries; that with the United States is small. The leading country in respect to trade with Bulgaria is Great Britain. In 1898 the total imports were

£2,909,210, and the total exports were £2,661,480. The chief exports are cereals, livestock, attar of roses, woollens, skins, cheese, eggs, timber, cocoons, and tobacco. There has lately been revived interest in railway building, and in 1899 there were 835 miles of railway open for traffic and 130 in process of construction. The telegraph lines in 1899 had a mileage of 3259. In 1899 the public expenditure was estimated at £3,361,421, and the revenue at £3,363,888. The public debt in September, 1899, was £8,281,960. The army numbers about 16,000, although 40,000 are annually liable to be drafted. The constitution dates from 1879, but was amended in May, 1893. The legislative authority is vested in a single chamber called the Sobranje, whose members are elected by universal manhood suffrage in the proportion of one to 20,000 of the population. There is also a Great Sobranje, consisting of representatives, elected on the basis of one to 10,000 of the population, to decide upon questions of superior national importance, such as the acquisition or cession of territory, changes in the constitution, and the succession to the throne. The executive authority is vested in the prince, who is aided by a council of eight ministers, nominated by him and having charge of the ministries of foreign affairs and public worship, interior, public instruction, finance, justice, war, commerce and agriculture, and public works. The reigning prince is Ferdinand, of Saxe-Coburg, who was elected by the National Assembly in 1887, the election being confirmed by the Porte and the great powers in 1896. The national religion is the orthodox Greek, and the church is governed by a synod of bishops. The state pays the clergy of the orthodox faith as well as the other forms of religion practised in the country.

Events of 1899.—Toward the close of January, 1899, a ministerial crisis occurred in Bulgaria, with the result of replacing the Stoilof by the Grekoff cabinet. The important point to foreign nations was the attitude of the new ministry toward Russia. The previous premier had broken with the policy of Stambouloff, and was conciliatory in his attitude toward Russia, opening the way to a complete reconciliation between Prince Ferdinand and the Czar. The probable course which the Grekoff cabinet would adopt was a matter of speculation. He had formerly the reputation of being a Russophobe, but circumstances had changed, and it was said that Prince Ferdinand would not permit an anti-Russian policy to be adopted by his ministers. On the 31st of January occurred the death of Princess Marie Louise of Bulgaria. On May 7, elections to the Sobranje were held, resulting in the return of 104 members of the government party and 53 opposition members. The government party, however, were soon divided, and later in the year M. Grekoff resigned. A new ministry was formed under M. Ivantchoff in October. The state of the public finances led Prince Ferdinand to forego one-half of the civil list for 1900, and there was a general reduction in the salaries of civil, military, and ecclesiastical officers.

BULLER, Sir REDVERS HENRY, general in the British army, succeeded General Sir George Stewart White in the supreme command of the forces in South Africa after the latter was besieged by the Boers at Ladysmith, Natal, early in November, 1899. After arriving in South Africa, General Buller proceeded with a strong force to the relief of General White, assuming command of the relief column on December 7, but on December 15 he suffered a serious reverse in attempting to force the passage of the Tugela River at Chieveley. His reported loss was about 1000 men and eleven guns. Two days later the chief command of the South African forces was given to General Lord Roberts, who soon after sailed from England for the Cape. (See TRANSVAAL, paragraphs on History.) General Buller was born in 1839, and entering the Sixtieth Rifles in 1859, began a career in which he has rendered to England much valuable service. He served in China in 1860, and in 1870 took part in the Red River expedition; participated in the Ashanti war of 1874, the Kaffir war of 1878, and the Zulu war of 1878-79. In 1885-86 he was deputy adjutant-general, and in the following year became under-secretary for Ireland; in 1890 he served as adjutant-general, and in 1891 received his commission as lieutenant-general. In 1898 he was appointed to the command at Aldershot, his last before going to South Africa. Buller had been regarded as one of the most active and most indomitable fighting generals in the British army.

BÜLOW, BERNHARD VON, German foreign secretary and son of the von Bülow who was foreign secretary of Germany under Bismarck in 1873-79, was born in Schleswig-Holstein, May 3, 1849. He entered the German foreign office in 1873, and was successively secretary of the embassy in Rome, St. Petersburg, and Vienna, and held the important post of *chargé d'affaires* at Athens during the Russo-Turkish war. Immediately afterward he was appointed one of the secretaries of the Berlin Congress. After serving in diplomatic capacities in St. Petersburg and Paris, he was appointed minister to Roumania in 1888, and to Italy in 1893. He filled Baron Marschall von Bieberstein's post as foreign secretary in Berlin during his absence in 1897, and succeeded him to that office. On February 11, 1899, he made a notable

LIEUTENANT-GENERAL SIR REDVERS BULLER.

speech in the *Reichstag* on the relations of Germany to the United States, especially with regard to the Philippine question. See GERMANY (paragraphs on History).

BUNCE, JOHN THACKRAY, English journalist, died June 28, 1899. He was born at Faringdon, Berks, April 11, 1828; was educated in Birmingham, and subsequently throughout his life was connected with the press of that city and with various municipal interests. From 1862 to 1898 he was editor of the Birmingham *Daily Post*, and he was connected with this paper until the time of his death. At various periods in his career Mr. Bunce was governor of King Edward's Schools, member of museums' and art schools' and free libraries' committees of the city corporation, trustee of Mason College, and professor of literature in the Royal Birmingham Society of Artists. He was a fellow of the Royal Statistical Society. His publications include: *Cloudland and Shadowland, a Story for Children*, 1865; *Fairy Tales, Their Origin and Meaning*, 1878; *History of the Corporation of Birmingham*, 1885; *Life of Sir Josiah Mason, with the History of Electro-plating and Steel Pen Making*, 1890; *History of the Birmingham Musical Festivals*.

BUNSEN, Professor ROBERT WILHELM, famous German chemist, died at Heidelberg, August 16, 1899. Dr. Bunsen was born at Gottingen, March 31, 1811. He studied there geology, chemistry, and physics, and continued his work in Paris, Berlin, and Vienna. In 1833 he was appointed a lecturer at Gottingen, and three years later was called to the chair of chemistry in the Polytechnic Institute at Cassel. From this place he went in 1838, as a professor, to the University of Marburg, then to Breslau in 1851, and the next year to Heidelberg, as professor of chemistry. Here he remained till the time of his death, though he retired from active service in 1889.

About the time of his professorship at Cassel he chose alkarsin—Cadet's fuming liquid—as the subject of special investigation, and laboriously prosecuted this work for nine years, the result of which was the creation of a new chapter in chemical science. In the course of these experiments an explosion destroyed the sight of one of his eyes. At Marburg Bunsen became interested in the hematite furnaces, and, realizing that a vast amount of heat was wasted, he invented the appliances of the hot blast. There resulted also from this investigation his method of gas analysis. In 1840 at the meeting of the British Association in Glasgow he first publicly announced his discovery of cacodyl and his method of nitrogen determination. In 1844 he studied volcanoes in Italy and in 1847 investigated the warm springs and geysers of Iceland. This work resulted in his theory of volcanoes and his explanation of the phenomena of geysers. The latter especially has been regarded very favorably by scientists. The beginning of his studies of electrolysis and the electric arc was in 1841; in this year he invented the battery cell bearing his name. Many appliances now in the laboratories are the inventions of Bunsen; most prominent of these, perhaps, are his burner and filter-pump. Probably his most important achievement was the discovery and development of spectrum analysis, by which three departments of science have been created—spectroscopy, spectroscopic chemistry, and spectroscopic astronomy. This work was accomplished in collaboration with his friend Kirchhoff. Bunsen was elected in 1883 one of the eight foreign associates of the French Academy of Sciences. His time was largely but cheerfully given to the instruction of his students, his own investigations being carried on in the early morning and at night. Excessive scientific work did not result in the atrophy of his emotional and sympathetic nature, but he always maintained an active interest in the world of men, in travel, in literature, in life. He published: *Enumeratio ac descriptio hygrometrorum*, 1830; *Das Eisenoxydhydrat, ein Gegengift des weissen Arseniks oder der arsenigen Säure*, 1834; *Schreiben an Berzelius über die Reise nach Island*, 1846; *Über eine volumetrische Methode von sehr allgemeiner Anwendbarkeit*, 1854; *Gasometrische Methoden*, 1857; *Chemische Analyse durch Spektralbeobachtungen*, 1861; *Anleitung zur Analyse der Aschen und Mineralwässer*, 1874; *Flammenreaktionen*, 1880.

BUREAU OF AMERICAN ETHNOLOGY. See ANTHROPOLOGY IN AMERICA.

BURMAH, a province of the Indian Empire, stretching from Tibet on the north to China on the east and Siam on the southeast. On the south and west it is bounded by the Indian provinces of Bengal and Assam and by the sea. It is divided into Lower and Upper Burmah, with a combined area of 171,430 square miles and a population, in 1891, of 7,605,560, of whom the great majority are Buddhists. The chief town of Lower Burmah is Rangoon with a population of 180,324, and the chief town of Upper Burmah is Mandalay with a population of 188,815. It has a fertile soil and abounds in mineral deposits, including copper, lead, iron, tin, jade, ruby, amber, marble, coal, and small quantities of gold and silver. The chief exports are rice and teak, and some manufactured goods are sent to the Shan states and China. It is governed as a part of the Indian Empire, being under a lieutenant-governor appointed by the viceroy and aided by a legislative council of nine members. For the year ending March 31, 1897, the revenue was Rx 5,883,624, and the expenditure Rx 4,222,271. Railway construction has been very rapid in recent years. Early in 1898

it was said that 887 miles of railway were open for traffic and that 261 more miles were either in process of construction or contracted for. On July 1, 1899, the first passenger train was run on the Mandalay-Kunlon line. The most important event of the year was the completion of the demarcation of the Chinese frontier in February. The line runs due east from the river Nam-Yang. Much comment was occasioned by an outrage committed by British soldiers at Rangoon. The inactivity shown by the officers in the matter indicated a lax state of military discipline, and in October, 1899, the governor-general in council issued orders censuring the offenders, reprimanding the officers, and announcing that the regiment would be removed to another station.

BUTLER, WILLIAM, D.D., a missionary of the Methodist Episcopal Church, died at Old Orchard, Me., August 18, 1899. He was born in Dublin, Ireland, January 30, 1818; in 1839 he entered the ministry, and came to the United States in 1850. In 1856 he went as a missionary to India, where he remained ten years. Returning to America, he preached in Boston and Chelsea, and then from 1860 to 1872 was secretary of the American and Foreign Christian Union. In 1873 Dr. Butler went to Mexico, and during the six years following labored in that country in the cause of Methodism. The most important work of his life was that accomplished in India, where he made many converts to Methodism. His field was chiefly in the northwest provinces. He was there during the Sepoy rebellion, and it is said was the only missionary who escaped. He published two standard works on missions, the one treating of India, the other of Mexico.

BUTT, CLARA, singer, born in Southwick, Sussex, February 1, 1870. She was educated at the Royal College of Music, London, and made her *début* in 1892 at a student's performance of *Orfeo* at the Lyceum Theatre, London. In 1899 she visited the United States. Her voice is an exceptional contralto.

BUTTERFIELD, CONSUL WILLSHIRE, American historical writer, died at South Omaha, Neb., September 26, 1899. He was born at Mexico, N. Y., July 28, 1824; he received an academic education, and in 1845-46 attended the State Normal School at Albany, N. Y. He taught school, and in 1848 was appointed superintendent of schools in Seneca County, O. In 1849 he went to California. After acting in 1853-54 as secretary of the Ohio and Indiana Railroad, he began the practice of law at Bucyrus, Ohio, where he remained from 1855 to 1875. In the latter year he removed to Madison Wis., and in 1888 to South Omaha, Neb. Besides various biographies and local histories Butterfield wrote: *A System of Punctuation for Schools*; *The History and Biographical Annals of the University of Wisconsin*; *History of Brule's Discoveries and Explorations, 1610-1626*; *History of Wisconsin*; *History of the Discovery of the Northwest by John Nicolet in 1634*; *History of the Girty's*; *An Historical Account of the Expedition Against Sandusky in 1782*. Butterfield edited: *Short Biography of John Leeth*; *The Washington-Crawford Letters*; *The Washington-Irvine Correspondence*; *The Journal of Captain Jonathan Heart*.

CACAO. See ECUADOR (paragraph Industries and Commerce).

CAISSON DISEASE. Thomas Oliver, in the London *Lancet*, No. 3937, 1899, reports a case of caisson disease, that rare affection which was first described scientifically by Pol and Wattle, at Douchy, France, in 1845. Triger, a French engineer, in 1839 first used a caisson in reaching a bed of coal lying underneath the River Loire. He sank an iron tube through the quicksands, excluding the mud and water by forcing air into the tube under great pressure. This engineering method was modified later, and the caisson of to-day is an air-tight, box-shaped structure, of iron or of wood, without top, inverted, and thus sunk to the bottom of a river. It forms the foundation for a pier or other superstructure, and after the latter has been partly erected the interior of the caisson is filled with masonry. While the workmen are excavating the soil at the bottom of the river and sinking the caisson till it touches bed-rock, they work within the caisson, gaining access to its interior by means of an opening in its top. A pump forces air into the caisson under pressure sufficient to drive out the water which would otherwise enter. Workmen occupied in the caisson suffer from going into the compressed air, and also from coming out of it. The latter is the more dangerous transition. Men can work in the caisson for from two to four hours, according to the pressure. An air-lock is attached to the outer surface of the caisson, in which the pressure can be gradually increased or decreased, as parties enter or leave the caisson. The most important examples of building in which the caisson was used for erecting piers have been furnished by this country. The first was the great bridge built by Captain Eads over the Mississippi River at St. Louis, the other the bridge between Brooklyn and New York, built by the Roeblings, father and son.

Most observers agree that decompression causes the symptoms from which the workmen suffer. In "locking in," or entering the caisson, the temperature rises as

high as 90° in some instances. A corresponding fall occurs on emerging. Thus in cold weather men drenched with perspiration, fatigued with hard work, and relaxed by removal of the air pressure, are brought quickly into a greatly lowered temperature. At the St. Louis bridge the men worked at first in shifts of two hours, three times a day. At the last, at a depth of 136 feet below high water, and under a pressure of 65 pounds to the square inch, they could work but forty-five minutes at a time. At the Brooklyn bridge the men worked at first in two shifts a day, of four hours each; later they worked but two hours at a time, at a depth of 78 feet, under a pressure of 36 pounds to the square inch. The symptoms of caisson disease are buzzing and pain in the ears, dizziness, loss of power in the legs, severe pains in arms, legs, and shoulders, bleeding from the nose and lungs, and occasional unconsciousness. There are three theories of the cause of caisson disease: (1) Poisoning by carbonic acid, (2) congestion of the internal organs with subsequent blood stasis, resulting in possible blocking of the blood-vessels by small thrombi, followed in turn by a necrotic process, and (3) increased solution by the blood of the gases met with in compressed air (principally nitrogen and carbonic acid) and the liberation of these gases during decompression. The second theory is apparently the most trustworthy, if one may judge from the results obtained in 1891 by Van Rensselaer, who has made the most scientific study published of a carefully conducted autopsy with microscopical examination. Preventive treatment suggested consists of selecting sound men for work in the caissons, securing removal of carbonic acid from the air in the caissons, and increasing the time spent in "locking out" to one minute for every three pounds of pressure. Morphia, heat, stimulants, strychnia, and ergot are recommended. Returning to compressed air and emerging with exceeding slowness has benefited many.

CALCIUM CARBIDE, from which acetylene gas is made, is produced in an electric furnace by the action of the heat of large electric currents upon a mixture of lime and coke, 97½ pounds of lime and 56½ pounds of carbon being required to produce 100 pounds of carbide. It is a hard, crystalline body, bluish black to reddish brown in color, is opaque, and there are no known solvents for it. It shows no change or signs of fusion under the action of powerful gas flame, but may be softened and even made to melt by electric heat. Upon adding water to calcium carbide, there is an immediate foaming evolution of the hydrocarbon gas, acetylene (see Gas). No statistics of production are available. It is manufactured in quantities for commerce in the United States, England, France, and Germany. In 1898 the price per ton in the United States was from \$70 to \$75.

CALCUTTA, the capital of the province of Bengal and the metropolis of India, lies on the western bank of the river Hoogly, a branch of the Ganges, about 100 miles from the sea by way of the river. In 1891 it had with its suburbs, exclusive of Howrah, a population of 861,764, and a later estimate places the population at 978,370. It is the seat of an important university, which in 1897 was attended by 2899 students. The expansion of its trade in recent years has been remarkable. In the United States Consular Reports for November, 1899, it is estimated that the total value of the imports for the year just closed from foreign countries alone, without counting the coasting trade, was about \$100,000,000, and that of the exports about \$140,000,000. It is further reported that in the year 1897-98 the sea-going steamers which entered the port numbered 1102, with a tonnage of 3,311,415, and the steamers that left the port numbered 1097, with a tonnage of 3,275,685. The tonnage of all vessels entering the port was more than thirteen times as much as it was in 1841-43. The tonnage of the sailing vessels formed but a small proportion of the total, while thirty years ago there were more than three sailing vessels to one steamer entering the port. The most important class of articles imported was cotton fabrics. Sugar, which used to be an important item of export, is now largely imported. As to the exports, jute, raw and manufactured, was the largest item, and next to this came tea. Other important exports were rice, opium, indigo, lac, silk, saltpetre, raw cotton, twists, and yarn. Coal-mining has of late become an important industry. The exports of coal have greatly increased. The city is the commercial distributing point for the larger part of India. In addition to its increasing trade, there are signs that it is becoming an important manufacturing centre.

CALENTURA. See TROPICAL FEVER.

CALIFORNIA, a Pacific coast State of the United States, has a land area of 155,980 square miles. The capital is Sacramento. California was admitted to the Union September 9, 1850.

Mineralogy.—The annual report of the State mining bureau for the calendar year 1898 gives the value of the total mineral production as \$27,280,079, against \$25,142,441 in 1897 and \$24,281,398 in 1896. The value of the total product of forty kinds of minerals in the period of 1887-98 was \$249,731,303. For the first time in the history of the State copper took second place among the mineral productions in 1898. The

principal productions of the year were: Gold, \$15,906,478, a slight increase over the product of the previous year; copper, 21,543,229 pounds, valued at \$2,475,168, a great increase over any previous production; quicksilver, 31,092 flasks, valued at \$1,188,626, a decline from second to fourth place; petroleum, 2,249,088 barrels, valued at \$2,376,420; borax, 8300 tons, worth \$1,153,000; and silver, \$414,055. The total value here reported was derived from thirty-five different minerals. The history of mining operations during 1899 is one of general activity and prosperity, with exceptional developments in copper, many surprises in gold, and much fruitful prospecting for other minerals. There was a remarkable increase in the production of gold in the southern counties, and the large mines in the famous Rand district of Kern County were run day and night at their fullest capacity, giving all the stamp mills more work than they could do. Among new features of the search for gold were the prospecting along the bottom of the Sacramento River, between Redding and Keswick, to ascertain if dredging would pay, and the dredging of the Tuolumne River bed and bottom lands in the expectation that this former golden stream would again yield large riches.

It would be futile to attempt to summarize the multitude of new finds of the precious metals or the results of renewed work on abandoned claims, but there are a number of mineral discoveries credited to 1899 that deserve mention. Prospecting in Riverside County disclosed valuable deposits of asbestos, magnesia, French chalk, manganese quartz, antimony, plumbago, white quartz, feldspar, and lithia. Near Randsbury, in the Black Mountain region, an excellent quality of bituminous coal was found, and it was estimated from examinations that the deposits occupy an area of 1600 acres. Another important find of coal was made in the mountains southwest of Los Banos, in Merced County. In San Diego County a kaolin deposit was discovered in El Cajon Mountain, which at first was considered valuable as pottery clay, but subsequently was found to be far more profitable for the aluminium it contains. Placer mining along Trinity River in Trinity County yielded considerable amounts of platinum and iridium. In Santa Barbara County a strike of semi-liquid asphaltum was made that needs but little refining, and is worth \$30 per ton. Near Frazier Mountain work was begun on extensive borax deposits, lying in dry lakes and ledges. Mica in large veins was discovered in Riverside County, near San Jacinto, in Ventura County, and on Marble Mountain; tin ore on the Klamath River; alum in Shasta County; antimony in Jawbone Cañon, and asbestos in Tulare County. Work was begun on the lepidolite mines near Pala, a New York druggist contracting to take the output for five years.

Development work was begun on the deposit of iron ore in San Emedio Cañon, Kern County, which shows 2,000,000 tons of iron ore, assaying 60 per cent. of metallic ore, with some gold and a little silver. Unusual activity was reported in the known and suspected petroleum fields, especially by prospectors and capitalists from Pennsylvania. Kern and Fresno counties are more than fulfilling their early promise as oil producers, and have each shown up a number of new and profitable fields. Oil in paying quantity was discovered during the year on the islands in Mono Lake, Mono County, and prospecting was begun in Colusa County. See IRRIGATION.

Commerce.—In the fiscal year ending June 30, 1899, the imports of merchandise at the ports of Humboldt, Los Angeles, San Diego, and San Francisco amounted in value to \$36,916,128, a decrease in a year of \$6,582,517; and the exports to \$31,840,533, a decrease of \$9,231,521. The trade of San Francisco alone was, imports, \$35,747,535; exports, \$30,214,904. The trade in gold and silver ore, bullion, and coin was, imports at San Diego and San Francisco, \$32,199,592; exports at San Francisco, \$6,664,691—making the total foreign trade of the year \$107,620,944, a decrease of \$16,931,232.

Banks.—On October 31, 1899, there were 35 national banks in operation and 17 in liquidation. The active capital aggregated \$10,825,000; circulation, \$2,164,817; deposits, \$35,312,068, and reserve, \$12,929,109. The State banks, July 31, 1899, numbered 176, and had capital, \$27,470,121; deposits, \$77,624,687, and resources, \$136,037,239; private banks, 18, with capital, \$852,143; deposits, \$1,438,055, and resources, \$2,576,648; and stock savings banks, 53, with capital, \$7,654,055; depositors, 209,908; deposits, \$145,943,163, and resources, \$161,319,236. The exchanges at the United States clearing houses at San Francisco and Los Angeles in the year ending September 30, 1899, aggregated \$1,001,834,752, an increase of \$116,710,379 in a year.

Railways.—During the calendar year 1898 new railway construction aggregated in length 118.29 miles, and during 1899, 169.35 miles, giving the State a total mileage of 5461.37. The active development of mining properties in 1899 led to the building of many short connecting lines for electrical propulsion.

Education.—At the close of the school year 1897-98 the school population was 347,624; enrolment in public schools, 259,459, and average daily attendance, 185,424. There were 7432 teachers, 3644 buildings used as school-houses, and public school property valued at \$17,349,468. The revenue was \$5,853,650; expenditure, \$6,266,470, of which \$4,671,191 was for teachers' salaries. There were 96 public high schools,

with 478 teachers and 12,620 secondary students; 63 private secondary schools, with 293 teachers and 2238 secondary students and 6735 elementary pupils; 4 public normal schools, with 74 teachers and 1892 students in all departments, and 3 private normal schools, with 8 teachers and 76 students in all departments. Normal training was also given in 4 colleges and 4 public high schools. Twelve colleges and universities for men and for both sexes reported 11 fellowships, 117 scholarships, 661 professors and instructors, 5547 students, 183,688 volumes in the libraries, \$562,700 invested in scientific apparatus, \$5,261,671 in grounds and buildings, and \$6,639,949 in productive funds, and \$881,646 in total income. Two colleges for women—Mills and Notre Dame—together had 57 professors and instructors, 228 students, 12,000 volumes in the libraries, \$488,000 invested in grounds and buildings, and \$107,405 in total income. In 1899 Mrs. Jane L. Stanford executed deeds conveying to the trustees of Leland Stanford University the bulk of all her wealth in stocks and real estate for the improvement and perpetual maintenance of that institution. This gift brought the total endowment of the university up to the great approximate sum of \$45,000,000. Another woman, Mrs. Phoebe A. Hearst, has devoted much of her large fortune to providing the University of California with a new habitation, which, when completed, will have cost several millions. A third educational event of 1899 was the election of Professor Benjamin Ide Wheeler, of Cornell University, to the presidency of the University of California. In 1899 there were 698 periodicals in the State, of which 110 were dailies, 455 weeklies, and 93 monthlies.

Finances.—On September 1, 1899, the total bonded debt was \$2,281,500, of which bonds for \$1,526,500 were held in trust for the State School Fund, and for \$751,000 for the State University Fund. The State School Fund also held \$200,000 of \$600,000 in depot bonds, not included in the general debt statement. The assessed property valuations in 1898 aggregated \$1,132,230,221, an increase in a year of \$42,856,905. The tax rate was \$4.88 per \$1000. All of the State debt bonds known to exist are held in the educational funds, the surplus of \$4000 being in 1857 and 1860 bonds, probably lost or destroyed.

Population.—As estimated by federal officials on June 30, 1899, the population was about 1,555,000.

Legislation.—It was decided to submit the following constitutional amendments to the people of California: To reduce the Supreme Court from seven to five judges; to provide three courts of appeal and define the jurisdiction of such courts; to give the legislature power to control primary elections; to except Stanford University and Lick School, church property and State, county, and district bonds from taxation, and to provide stenographers for the superior courts. The charters of municipalities received a great deal of legislative attention. A bill which legalized prize-fighting contests up to twenty rounds was approved by Governor Gage, March 31, 1899. The desecration of the flag was prohibited. Eight hours were declared to be a day's labor on public works.

Two bills were passed that restrict the liberty of the press in California, and their constitutionality will probably be tested in the courts, inasmuch as the State constitution expressly declares that "every citizen may freely speak, write, and publish his sentiments" on all subjects, and that no law shall be passed to restrain or abridge the liberty of speech or of the press. The Anti-Cartoon act made it unlawful to publish the portrait of any living person, a resident of California, without the written consent of such person, except those holding office or convicted of crime. The Newspaper Signature act made it obligatory, under penalty of a fine, that every article or editorial blackening the memory of the dead, or impeaching the honesty, integrity, virtue, or reputation of the living, or calling attention to their natural or alleged defects, should be signed by the name of the author.

The Deadlock in the Legislature.—The legislature began its biennial session on January 2, and on January 10 began balloting for a United States senator to succeed Stephen M. White (Democrat), whose term of office expired March 4, 1899. There were 11 Republican candidates, of which the leading ones were U. S. Grant, Jr., D. M. Burns, W. H. L. Barnes, and State Senator R. R. Bulla. The Democrats merely cast a complimentary vote for their candidates, there being 86 Republicans and 34 Democrats on joint ballot, of which 61 were requisite for an election. Governor Gage favored Mr. Burns from the beginning and bitterly opposed Mr. Grant. On March 18 the joint session adjourned, after taking 87 ballots, without making an election, and thus ended the most stubborn deadlock of the legislature in the history of California. An exciting incident of the convention occurred on January 15, when Howard Wright, speaker of the Assembly, was charged with securing a loan of \$1650 from Mr. Grant's manager; a committee was appointed the following day to investigate the charges, and on January 27 filed a report showing that his conduct was censurable; a motion to expel him on account of bribery charges was defeated by a vote of 60 to 10, but on January 30 Mr. Wright resigned the speakership, at the same time declaring that he was guilty of no crime.

and that the findings of the committee were not warranted by the evidence. Mr. Alden Anderson was elected to succeed him.

The San Francisco Charter.—The provisions of this charter are regarded as very thorough and advanced, and this new departure and effort at municipal reform contains much that is of interest. The legislative power is lodged in eighteen supervisors, elected at large; the mayor presides and has the power of veto, but such veto may be overridden by fourteen votes. If fifteen per cent. of the voters petition for a particular ordinance to be voted upon, it must be submitted, and if a majority of votes favor it, it becomes a law at once. Every ordinance granting a franchise or leasing or selling any public utility must be submitted to a vote. The city charter is amendable by vote of the people. No street-railroad franchises shall be granted for more than twenty-five years and must be advertised and bid for. No bid shall be received for less than three per cent. of the gross receipts for the first five years. The city retains the right to regulate fares. The mayor is elected for two years and has exceptional powers. He appoints the Board of Public Works and the Board of Education. The powers and duties of these boards are most carefully guarded. Police commissioners are appointed by the mayor. The police force is to be pensioned for old age and disability from a relief fund, and a similar fund cares for firemen. Most stringent civil service rules are in force. It is the purpose of the city to acquire and ultimately own all its public utilities, and the charter points out the steps to be taken to acquire such ownership.

State Officers and National Representatives.—Governor, H. T. Gage; lieutenant-governor, J. H. Neff; secretary of state, C. F. Curry; treasurer, T. Reeves; comptroller, E. P. Colgan; adjutant-general, W. H. Seamans; attorney-general, T. L. Ford; superintendent of education, T. J. Kirk; surveyor-general, M. J. Wright; supreme court chief justice, W. H. Beatty; associate justices, T. B. McFarland, C. H. Garoutte, R. C. Harrison, W. Van Dyke, F. W. Henshaw, Jackson Temple; clerk, G. W. Root. The State legislature consists of 88 Republicans, 32 Democrats, 2 Populists, and 1 Independent. Senators: George C. Perkins (Republican), from Oakland; the other senatorship (Republican) is not yet filled. Representatives: John A. Barham (Republican), from Santa Rosa; Marion De Vries (Democrat), from Stockton; Victor Metcalf (Republican), from Oakland; Julius Kahn (Republican), from San Francisco; Eugene F. Loud (Republican), from San Francisco; Russell J. Waters (Republican), from Los Angeles, and James C. Needham (Republican), from Modesto.

CALIFORNIA UNIVERSITY OF, at Berkeley, Cal., was founded in 1868, and its roll of students for the year 1898-99 was larger than in any previous year; the degrees given at the end of the year numbered 360. Among the important gifts received during the year was that of a scholarship from Mrs. C. B. Houghton, of Benicia, in memory of her late husband, and to be called by his name. Professor George Davidson began his work in the newly established College of Commerce. University extension courses were given in San Francisco; farmers' institutes were vigorously pushed throughout the year, exciting great interest; nearly 100 meetings were scheduled. Additional courses in summer schools were provided and a further expansion of summer work organized for another year. The interest in athletics was more general than in any former year. The Wilmerding School, under the care of the regents, found a director in Mr. Everett Schwartz, of Waltham, Mass., and the site originally selected for its buildings has been exchanged for a more convenient one very near the Lick School, so that the two schools will be enabled to work in friendly co-operation. The Regents' Committee on Finance reported an estimated deficit of over \$47,000 for 1899-1900, and the president in his annual statement made a strong appeal for endowments. Professor Benjamin Ide Wheeler (*q. v.*) was inaugurated president. Mrs. Phoebe A. Hearst proposed to give \$8,000,000 toward the endowment fund of the university. The competition to secure the best plans for the new university buildings was held under Mrs. Hearst's patronage at an expense to her of \$10,000. (See ARCHITECTURE.) For statistics, see UNIVERSITIES AND COLLEGES.

CALVÉ, EMMA, French opera-singer, born in Decazeville in 1866, studied singing in Paris under M. Laborde and Mme. Marchesi, and made her *début* in Brussels at the Théâtre de la Monnaie in 1882 as Marguerite in Gounod's *Faust*. In 1884 she was engaged by M. Victor Maurel at the Théâtre Italien, Paris, and sang in *Aben Hamet*, by Dubois. She appeared at La Scala, Milan, and, returning to Paris, sang at the Opera Comique. She made her first appearance in London in 1892, and in 1893 came to New York. In 1899 she came to the United States on her third visit. Her greatest part, Carmen, was first sung in 1892. Her favorite rôles are: The Countess and Cherubino in the *Nozze di Figaro*; Carmen; Ophelia, in *Hamlet*; Pamina, in *The Magic Flute*; Santuzza, in *Cavalleria Rusticana*; Leila, in Bizet's *Les Pecheurs des Perles*; and Sapho in Massinet's opera of that title.

CAMBODIA, a province of French Indo-China, with an area of 46,000 square miles, and a population estimated at 1,500,000, composed of a variety of native tribes, together with 250,000 Chinese and Anamites, and 40,000 Malays. The country has been a French protectorate since 1863. It has a fertile soil, and produces rice, betel, tobacco, indigo, sugar-cane, pepper, maize, cinnamon, and coffee. It has formed since 1887 a part of the customs union with Anam and Tonquin, and with these two provinces and Cochin-China it is under the direction of the Superior Council of Indo-China (*q. v.*), though the local administration is in the hands of the native ruler, King Norodom.

CAMEROON, or the **CAMEROONS** region, a German protectorate of West Africa, has a coast-line of about 200 miles on the Bight of Biafra, between the Campo River and the Rio del Rey, and is bounded on the north by the Niger territories, and on the south and east by French Congo. Its area is estimated at 191,130 square miles, and its population at 3,500,000, of whom 324 were Europeans on January 1, 1898. It extends northward as far as the southern shore of Lake Tchad. The native inhabitants are Bantus and Soudan negroes. The chief town is Cameroon, on the coast, and other important trading centres are Buea, Victoria, Bibundi, and Campo. There is an abundant rainfall. Statistics for the year ending in June, 1898, showed that rain fell on 171 days in that period. The heaviest rainfall was in the season from June to October, and the lightest in the months of January and December. The climatic conditions have not been favorable to Europeans, who have suffered greatly from malarial fevers, but of late there has been an improvement in this respect. The soil is rich, and there is a variety of vegetable products, including cacao, coffee, tobacco, cloves, caoutchouc, vanilla, ginger, pepper, ivory, and palm-oil. Gold and iron are said to occur. Plantations of coffee, cacao, and tobacco have been started and are flourishing, but the development of the colony has been checked by the scarcity of labor, which made it necessary to import foreign workmen. It was reported in 1899, however, that the natives are showing more readiness to work on the plantations. The exports for 1897-98 were valued at 3,920,194 marks, the chief items being gums, palm-nuts, palm-oil, and ivory, and the less important articles being ebony, kola, gum-copal, tobacco, coffee, mahogany, and red wood. The imports for the same period were valued at 7,128,153 marks. The budget for 1899-1900 was estimated at 1,713,000 marks. It was organized as a protectorate in 1884, and is under an imperial governor, assisted by a local council. The boundaries toward the British territories were settled by agreements in 1893, and toward the French sphere of influence by agreements in the following year. There is a small military force, consisting chiefly of natives, and it has been actively employed of late in putting down native revolts. In 1898-99 a number of expeditions were made into the outlying parts of the colony for the purpose of opening up those regions.

CAMPBELL-BANNERMAN, Sir HENRY, G.C.B., M.A., LL.D., member of Parliament for the Stirling district of Scotland since 1868, was unanimously elected leader of the Liberal members of the Commons on February 6, 1899, to succeed Sir William Vernon Harcourt, who had resigned in the preceding December. Sir Henry Campbell-Bannerman is the son of the late Sir James Campbell, and was born September 7, 1836. He assumed the additional name Bannerman, in accordance with the will of his maternal uncle, the late Henry Bannerman. He was educated at Glasgow University and Trinity College, Cambridge, and in 1871 became financial secretary to the war office, which position he held until 1874, and resumed in 1880-82. During the next two years he was secretary to the admiralty, and in 1884-85 was chief secretary for Ireland. In 1886 and from 1892 to 1895 he was secretary of state for war. When Sir William Harcourt resigned the leadership of the Liberal party, that party had become comparatively weak and inefficient. It was torn with internal dissensions, which sprung up after it lost the guiding hand of William E. Gladstone. During 1899 Sir Henry Campbell-Bannerman proved himself an able leader, and brought into at least formal harmony the rival sections of the party, which tend to respond to the influence of himself, Sir William Harcourt, and Mr. John Morley, respectively.

CANADA, DOMINION OF, occupies the northern part of North America, with the exception of the crown colony of Newfoundland, to which Labrador belongs, and of Alaska, which belongs to the United States. The known area in 1899 was 3,653,946 square miles, of which 3,048,711 square miles were land surface, and 605,235 square miles water surface. In addition to this gross area there is the district of Franklin, which was organized October 2, 1895, but has not yet been fully surveyed. The density of population for the entire Dominion, as shown by the census returns of 1891, is 1.5 per square mile. Prince Edward Island had 54.5 persons to the square mile; British Columbia, 0.3, and the provisional districts, 0.2. The capital of the Dominion is Ottawa, and the chief cities are Montreal, Toronto, Quebec, Hamilton,

St. John, and Halifax. The provinces are Quebec, Ontario, Nova Scotia, New Brunswick, Prince Edward Island, Manitoba, and British Columbia, and the districts are Keewatin, Assiniboia, Saskatchewan, Alberta, Athabasca, Yukon, Mackenzie, Ungava, and Franklin. The rivers and the Canadian part of the Great Lakes have together an area of 47,400 square miles.

The following statistics for the entire Dominion, as well as those for the separate provinces, are for the fiscal year ending June 30, 1898, as published in 1899, excepting where otherwise specified:

Agriculture.—In 1899 crop returns, more or less complete, were available from Ontario, Manitoba, New Brunswick, Prince Edward Island, and the Northwest Territories, and will be found under those titles. During the year the exports of animal and agricultural products, all domestic, aggregated in value \$75,834,858, of which \$5,054,853 went to the United States. The agricultural products included wheat to the value of \$17,313,916; wheat flour, \$5,425,760; oats, \$3,041,578, and pease, \$1,813,792. The export of live stock comprised 14,349 horses, valued at \$1,497,444; 213,010 cattle, valued at \$8,723,292, and 351,789 sheep, valued at \$1,272,077. Meats of all kinds, of domestic production, were exported to the gross value of \$8,737,484; eggs, \$1,255,304; butter, \$2,046,686, and cheese, \$17,572,763. The total imports of live stock, dressed meats, and general agricultural products, entered for home consumption, had a value of \$17,942,534, of which \$14,287,685 went from the United States. Exports of raw wool amounted to 1,014,420 pounds, valued at \$177,154. In October, 1899, it was officially estimated that the Dominion would have nearly double the exportable quantity of wheat that was available the preceding year; and that Manitoba would supply more than half of this increase. The quantity exported in 1898 was: Wheat, 18,963,107 bushels; wheat flour, 1,249,438 barrels. Of all cheese in the British market Canada supplies 65 per cent. There are nearly 3000 cheese factories in operation, and the Dominion and provincial governments are promoting the industry with liberal appropriations.

Mineral Products.—In the calendar year 1898 the mineral products had an aggregate value of \$37,757,197, an increase in a year of more than \$9,000,000. The most valuable ones were gold (partly estimated), \$13,700,000; coal, \$8,227,958; silver, \$2,583,298; copper, \$2,159,556; nickel, \$1,820,838; lead, \$1,206,399; petroleum, \$981,106; asbestos, \$486,227; cement, \$397,580; natural gas, \$320,000; salt, \$248,639; gypsum, \$230,440, and coke, \$219,200. Exports of the principal products amounted in value to \$15,210,947. Nova Scotia produced the largest amount of coal, 2,563,180 tons (2000 pounds), and of iron ore, 34,776 tons. The output of gold in the Yukon district was estimated at \$10,000,000, and in the Saskatchewan district at \$25,000. In British Columbia it was \$2,939,852; Nova Scotia, \$538,590; Ontario, \$265,889, and Quebec, \$6089. The famous Sudbury nickel mines yielded more than 5,500,000 pounds in matte, and the exports of the mineral, principally to the United States, amounted to 14,760,996 pounds, valued at \$970,531. In November, 1899, an order in council was adopted by the Ontario government authorizing the renewal of an offer to the British government of an interest in the unpatented portion of the nickel lands of the province, and providing also that the Ontario government may reserve to itself the right to prohibit the export of nickel ore and matte, and that hereafter the conditions under which all grants of nickel lands shall be issued shall be that the ores of such lands be refined in the province. See also **ONTARIO**.

Fisheries.—The last official statistics of the fisheries industry are for the calendar year 1897. The value of the yield of all kinds was as follows: Nova Scotia, \$8,090,346; British Columbia, \$6,138,865; New Brunswick, \$3,934,135; Quebec, \$1,737,011; Ontario, \$1,289,822; Prince Edward Island, \$954,949, and Manitoba and the Northwest Territories, \$638,416; total, \$22,783,546, an increase in a year of \$2,376,122. There was a total of 78,959 men employed on vessels and other boats engaged in all fisheries, and a capital investment in vessels, nets, and all other apparatus of \$9,370,794. The government expended \$432,635 in promoting the industry, of which \$157,504 was for bounties. Chief values in the total catch were: Salmon, \$5,670,075; cod, \$3,901,539; lobsters, \$3,485,266; herring, \$2,099,077; haddock, \$882,483; whitefish, \$651,429; mackerel, \$597,306; trout, \$534,873, and pickerel, \$316,596. The sealing industry employed 42 vessels, 149 boats, 288 canoes, 495 white men in crews, and 587 Indians, and had a catch of 30,410 seals, whose skins were valued at \$304,100.

Commerce.—The imports of merchandise, in the fiscal year ending June 30, 1898, aggregated in value \$140,323,053; exports, \$164,152,683; excess of exports, \$23,829,630; duties collected on imports, \$22,157,788. The movement in gold and silver coin and bullion was, imports, \$4,390,844; exports, \$4,623,138. The total trade of the year showed an increase of \$47,306,874 over that of the previous year. Of the total imports, \$86,900,702 was from the United States, and \$32,866,007 from Great Britain, and of the total exports, \$104,998,857 went to Great Britain, and \$45,702,678 to the United States. The aggregate trade with the United States showed an increase in the year of about \$12,500,000, and with Great Britain an increase of \$31,226,000.

Official returns for the fiscal year ending June 30, 1899, showed an increase of \$17,185,677 in the total trade over that of the previous year. The gain was attributed to an increase in imports of \$22,441,255. Total exports showed a decline of \$5,345,178, and the exports of domestic productions a decrease of \$7,245,241. Duties collected on imports amounted to \$25,734,229, an increase in the year of \$3,576,441. The merchant marine of the Dominion, on January 1, 1899, comprised 1909 steamers, of 267,237 gross tonnage, and 4734 sailing vessels, of 426,545 gross tonnage. Of the total vessels, 278, of 24,522 tons, were built and registered in the previous year. The revenue of the department of marine was \$120,602; expenditure, \$845,617. For the protection of shipping there were, on the coasts, lakes, and rivers, 654 light stations, 816 lighthouses, 22 fog-whistles, and 40 automatic fog-horns, and \$451,156 was expended for maintenance.

Banks.—The official bank statement for June 30, 1898, showed aggregate paid-up capital, \$62,303,137; notes in circulation, \$36,539,103; deposits of all kinds, \$240,370,873; total liabilities, \$277,407,521; and total assets, \$365,634,052. Discounts given by the banks amounted to \$245,670,654, and the average monthly reserve of the banks through the year was \$27,627,520. Exchanges at the clearing-houses in Montreal, Halifax, Toronto, Hamilton, Winnipeg, and St. John, aggregated \$1,390,019,344, an increase in a year of \$215,308,999. There were in all 641 bank branches in operation. The government savings banks numbered 25, and had 46,093 depositors and \$15,630,181 in deposits; and the post-office savings banks, 814, with 142,289 depositors and \$34,480,938 in deposits—total savings banks, 839; depositors, 188,382; deposits, \$50,111,119. There were 95 loan companies and building societies, which reported paid-up capital, \$44,615,756; reserve, \$10,317,455; deposits, \$18,986,154; total loans, \$116,143,533; liabilities, \$144,870,248, and assets, \$145,378,910.

Insurance.—At the close of 1898 there were 34 fire insurance companies in operation, which together received for premiums \$7,349,669, and paid for losses \$4,784,287; 5 inland marine insurance companies, 2 ocean marine insurance companies, and 26 miscellaneous insurance companies. There was a total of \$368,545,985 life insurance in force, of which \$226,231,636 was carried by Canadian companies, \$36,606,195 by British, and \$105,708,154 by United States. The income from premiums of all life companies was \$12,002,174.

Railways and Canals.—On June 30, 1898, there were 16,870 miles of track laid and 16,717 miles in operation, besides 28 miles of track in Nova Scotia belonging to private corporations. The separate railways number 166, of which 25 constitute the Grand Trunk system; 23 the Canadian Pacific system, and the remainder are more or less consolidated in minor systems. The Canadian Pacific system has 6,300.71 miles of track laid; the Grand Trunk, 3,161.08, and the Intercolonial and Prince Edward Island, 1,355.46. The ordinary share capital of all railways was \$266,669,857; preference capital, \$111,481,933; bonded debt, \$354,946,866. Grants by the Dominion government aggregated \$151,509,812; by provincial governments, \$31,495,545; and by municipalities, \$15,660,668. The earnings of all roads in 1898 amounted to \$59,715,105, and the operating expenses to \$39,137,549. Up to June 30, 1898, there had been expended on canal works and maintenance a total of \$87,571,498, of which \$15,067,096 was appropriated from income. The most costly canal, the Welland, had cost for construction up to that date \$24,208,155, of which \$16,569,915 was expended since confederation. The total revenue from all the canals since confederation was \$11,710,240, an annual average of \$377,750. The closing months of 1899 marked two important events in the history of Canadian canals: first, the completion of the work of deepening what are known as the St. Lawrence canals, thereby providing a channel fourteen feet in depth from Lake Ontario to Montreal, in place of the former nine-foot channel; and second, the completion and opening of the Soulanges Canal, a waterway 14 miles long, on the north side of the river, which, with one guard and four lift-locks, overcomes a total rise of 82½ feet. The new canal replaces the shallow Beauharnois Canal, and is operated and lighted by electricity. It had cost for construction, on June 30, 1898, \$3,655,436, and when opened, in November, 1899, it represented an outlay of more than \$5,000,000. During the navigation season of 1897 the traffic through all Canadian canals was represented by 23,375 Canadian vessels of 4,046,283 tonnage and 7024 United States vessels of 4,702,339 tonnage, and the tolls amounted to \$327,218.

Post-offices and Telegraphs.—On January 1, 1899, the Canadian and United States authorities agreed that there should be a uniform rate of two cents between the two countries, and an assimilation of post-office action in all respects, interchange of stamps, readdress of letters, etc., and on June 1, following, the proclamation, establishing the postage rate within Canada at two cents per ounce, went into effect. Post-offices in the Dominion and Newfoundland, June 30, 1898, numbered 9282, and in the year then ended they handled 134,975,000 letters, 28,150,000 postal cards, and 108,402,655 pieces of periodicals and parcels. The revenue of the department was \$4,686,650; expenditure, \$4,734,252; deficit, \$47,602. Of 3,534,500 registered letters estimated to

have been handled in the year, only 113 containing money failed to reach their destination. The money-order system had 1739 offices, at which 1,164,857 orders were issued. The orders issued and payable in Canada amounted to \$12,082,658; orders issued in Canada and payable elsewhere, \$2,435,822; and orders issued elsewhere and payable in Canada, \$2,162,971. The Dominion government owned and operated 2751½ miles of land telegraph lines and 239 (statute) miles of cables, with 164 offices, and had revenue, \$10,751, and expenditure, \$56,733. The Great Northwestern Telegraph Company, the Canadian Pacific Railway Company, and the Western Union Telegraph Company, which operated all non-government lines, had together 29,548 miles of line, 76,013 miles of wire, and 2591 offices, and handled in the year 4,407,265 messages. Telephone companies numbered 62, with 1369 offices, 43,547 sets of instruments, and more than 70,000 miles of wire.

Education.—Reports of the public, high, normal, and model schools, principally for 1898, give the following summary: Number of public schools, 17,558, other schools, 936; pupils in public schools, 947,208, in other schools, 133,031; average attendance in public schools, 568,337; teachers in public schools, 22,080, in other schools, 4393; revenue from government, \$3,075,407, from other sources, \$6,260,025; and expenditure, \$8,527,410. The higher institutions comprise 17 universities, with 5955 students; 19 colleges, with 2221 students; 19 classical colleges in Quebec, mostly affiliated with Laval University, with 5474 students; 7 colleges for women, with about 1000 students; and 5 agricultural colleges, with 267 students. For further details, see titles of the several provinces. At the end of 1899 there were 875 periodicals, of which 107 were dailies, 606 weeklies, and 101 monthlies.

Finances.—The revenue of the consolidated fund, in the year ending June 30, 1898, was \$40,555,238; expenditure, \$38,832,526, giving an excess of revenue, for the first time since 1893, of \$1,722,712. The customs revenue was \$22,157,788; internal revenue, \$7,884,001; postal service, \$4,686,650; miscellaneous revenue, \$7,450,973—total receipts, \$42,179,412, an increase in a year of \$2,841,411. The expenditures aggregated \$39,991,366, the largest being, on account of the public debt, \$13,076,614; post-office, \$4,734,252; appropriations for railways and canals, \$4,239,765; and subsidies to provinces, \$4,237,372. Civil government cost \$1,399,422; militia and defence, \$1,514,472; public works, \$1,857,627; legislation, \$729,820; and administration of justice, \$765,608. The gross debt of the Dominion was \$338,375,984; assets, \$74,419,585; net debt, \$263,956,399, an increase in a year of \$2,417,800. Of the total assets \$58,359,815 was interest-bearing. Sinking funds held \$40,876,158. A preliminary statement by the Dominion finance department for the fiscal year ending June 30, 1899, showed that the revenue of the consolidated fund was the largest in its history, \$44,698,155, and the expenditure the smallest since 1884, \$33,698,592. It was expected that the settlement of all outstanding accounts would leave a surplus of about \$5,000,000. The public debt was increased by about \$3,000,000, chiefly by new canal work.

Population.—As officially estimated the population in 1898 was 5,248,315, an increase in a year of 62,325. The Indian population was reported at 100,093. There were 273 schools for Indian youth, which had an enrolment of 9886 and an average attendance of 5533. For industrial pursuits of the Indians, see titles of the separate provinces.

HISTORY.

Political Parties.—The chief political parties are the Conservatives and the Liberals. The former were in control of the government from the time of the formation of the Dominion in 1867 to 1896, with the exception of an interval of five years. In 1896 the Liberal party came into power under Sir Wilfred Laurier, the main planks of their platform being gradual free trade, the promotion of foreign trade, and non-interference in provincial affairs, while the chief principles of the Conservative platform at the time were protection, a preferential tariff, internal improvement, and interference on behalf of the Roman Catholics in Manitoba. The less important parties are the McCarthyites, who separated from the Conservatives, and the Patrons of Industry, a Labor party. In 1899 efforts were made to form a stronger labor party which should be independent of the old political organizations. A step in this direction was taken at the Trades and Labor Congress on September 22 in Montreal, where it was resolved that the central bodies of labor in Canada should organize an independent labor party with distinct aims, and that members of labor organizations should cut loose from the old capitalistic political parties.

Parliamentary Session.—The fourth session of the present Parliament was opened by the new governor-general, the Earl of Minto, on March 16, 1899, and came to an end on August 11. Not much legislation marked the session, but many important subjects were discussed. Among these may be mentioned the so-called "Yukon Scandal," which arose from an accusation on the part of the Conservatives that the official administration of the Yukon region was corrupt; the proposed reform of the

Dominion Senate, the redistribution bill, the budget, railway measures, exclusion of oriental immigrants, a life insurance law, and the revision of the criminal code. Another feature of the session was the discussion of the relations between Canada and the United States, the Conservatives being inclined to accuse the Liberal ministry of too great subservience to the interests of the United States in the matter of the Alaskan boundary and the other points in dispute between the two countries.

"The Yukon Scandal."—The ex-premier, Sir Charles Tupper, led the attack on the government for its negligence and corruption in connection with the administration of the Yukon. He charged the Yukon officials with corruptly awarding contracts and liquor licenses, and with favoritism in the records of mining claims. The government's reply consisted in a vigorous denial and in the promise of an investigation. The charges involved the personal character of the present Yukon commissioner and his predecessor, and the minister of the interior also came in for some severe censure. The debate began on the speech in reply to the address from the throne, and took up twenty working days of the session. The Conservatives were voted down by a majority of 53 votes, and Parliament declared its entire confidence in the integrity and ability of the Yukon commissioner, as well as its belief that the commissioner would investigate the charges of maladministration in an impartial and thorough manner. On May 30 the commission appointed to investigate the charges made a partial report, in which the leading officials were completely exonerated. The Conservatives retorted by sharp criticism of the report and by new charges of corruption on the part of the Yukon officials. The administration of the minister of the interior was characterized as grossly negligent and inefficient, and as having recommended the appointment of incapable and corrupt officials. Bribery, breach of trust, blackmail, and the dishonorable use of official information were among the charges. On June 28 a Conservative member, Sir Hibbert Tupper, requested the appointment of a royal commission, but the government was again sustained on June 30 by a majority of 50.

Senate Reform.—For some time there has been a movement to reform the Canadian Senate in such a way as "to bring it into harmony with the principles of popular government." This has been in fact a part of the Liberal programme. Sir Wilfred Laurier, the premier, proposed that in the event of conflict between the two bodies a joint vote should decide the question. The tendency of the Senate to obstruct legislation and the vague limits of its powers seemed to call for some well-defined constitutional restraints. It was held that its powers should be limited and brought under control, and that provision should be made against parliamentary deadlocks in the future. Some favored the reduction of the senatorial term from life membership to a term of years. The provincial legislatures passed resolutions petitioning for an amendment of the constitution to this end. On July 17 the premier offered a resolution requesting the imperial government to introduce an amendment to the constitution which should provide for the joint vote of the members of the two houses in the event of a disagreement between the House and the Senate, such joint vote to have the same force and effect as the vote of the Senate under the present constitution. This resolution, however, was not voted upon, being withdrawn by the premier to expedite the work of the session.

Redistribution.—The British North America Act creating the Canadian constitution provides that the number of representatives from the province of Quebec shall be fixed permanently at 65. The number of inhabitants which shall entitle each of the other provinces to a representative was to be determined at each decennial census by dividing the population of Quebec by this number, 65. In 1881 this division made 20,000 the number of inhabitants entitling a province to one representative, and in 1891, owing to the increase of the population of Quebec, the unit of representation was 23,000. The act provides that on the completion of each decennial census the representation of the four provinces shall be readjusted by such authority and in such a manner and at such time as the Parliament of Canada from time to time provides. Thus it is left for the federal Parliament to introduce a redistribution bill providing for the application of this sliding scale to the changes in the population as revealed by the new census. Redistribution bills were passed by the Conservative government in 1882 and 1892, and the Liberals claimed that on each of these occasions their opponents had made use of their power to gerrymander in their own interest. In fulfilment of their pledge to secure a more equitable basis for representation in Parliament the Liberals introduced a measure, known as the Redistribution bill, in the Commons on May 19. They claimed, however, that it was in no sense a redistribution measure of the character contemplated in the constitution in connection with the readjustment of distribution of representation to conform to changes in the population, but was merely a measure to redress the wrongs committed by their political opponents who had disregarded the county boundaries with a view to securing for themselves a majority of seats. The new measure provided that the boundaries of the new constituencies should coincide with those of the townships and counties, and

that the division of cities and counties into ridings should be made by commissions of judges and not by politicians as before. The effect of this would be practically a redistribution of seats, since from some localities the number of members would be increased and from others diminished. The main changes would take place in the province of Ontario. On the other hand the Conservatives claimed that the measure was violative of the British North America Act, which provided that redistribution should take place only after the decennial census. The bill passed the Commons on July 10, but was rejected ten days later by the Senate on the ground that no readjustment of representation should be considered until after the next decennial census—namely, in 1901.

Railway Legislation.—Two railway bills passed the Commons on June 13, one providing for the government purchase of the Drummond County Railway and the other to "confirm an agreement with the Grand Trunk for use of its lines to provide an extension of the Intercolonial into Montreal." These measures passed the Senate with slight amendments in July. Severe conditions were imposed upon the granting of railway subsidies, which had hitherto been unconditional. These conditions give to the grants the character of perpetual loans, and provide for governmental supervision of the freight rates. The amount of the subsidies voted was more than \$6,000,000, and they were bestowed upon lines that will form a part of the new Trans-Continental system, which will consist of sections of the Great Northern, the Canada Atlantic, Ontario and Rainy River Road, and the Canadian Northern.

Other Parliamentary Matters.—A measure to amend the criminal code was introduced in the Senate, but subsequently withdrawn to facilitate the work of the session. Another proposed measure was a bill for the purpose of adding to the security of policy-holders in life insurance companies. To accomplish this, it changes the interest basis upon which reserves are to be calculated and provides for an extension of the companies' powers in investing their funds. Under the existing act the companies hold their reserve on insurance obligations at an interest of $4\frac{1}{2}$ per cent., while the new act would permit interest at $3\frac{1}{2}$ per cent. According to the budget estimates, the revenue is placed at \$46,600,000 and the expenditure at \$42,000,000. The exclusion of oriental emigrants was aimed at by the legislature of British Columbia, but the act embodying this purpose was disavowed by the Dominion government, probably on grounds of imperial policy. The death of Sir James Edgar rendered necessary the appointment of a new speaker, and on August 1 the office was filled by the election of Mr. Thomas Bain, Liberal member of Parliament for South Wentworth. A new member of the cabinet was appointed on September 30 in the person of Mr. James Sutherland, member of Parliament for North Oxford, who was sworn in as a member without portfolio. The inter-imperial preferential trade measure started by Sir Charles Tupper was negative on July 21. The Canadian government adopted resolutions of sympathy with the imperial government in the South African war.

Prohibition.—As stated in the last YEAR BOOK, the doubtful results of the prohibition plebiscite did not seem to the ministry to warrant the introduction of a measure of prohibition, and some of the prohibitionists themselves declared that in view of the smallness of the majority in favor of prohibition the government was not justified in legislating a measure along prohibition lines. On March 4, 1899, Sir Wilfred Laurier announced that the government would not support a prohibition measure, saying that no good purpose would be served by forcing such a measure, and the policy had received the support of only about 23 per cent. of the electorate. The more zealous prohibitionists determined, however, to appeal to Parliament against the policy of the ministry. No definite action was taken by Parliament in the matter of prohibition, and as time went on it seemed to be the general opinion, outside of Parliament and in, that the plebiscite was not of a nature to warrant prohibition legislation. At the same time, the opinion of the people was sharply divided on the subject of the proper attitude for the provincial authorities to take in this matter. At a meeting of the Dominion Alliance in Toronto, Ontario, on July 12, a resolution was adopted to the effect that any province whose electors should give a majority in favor of prohibition at the next general federal election should prohibit the sale of intoxicating liquors.

Anglo-American Commission.—The Anglo-American Joint High Commission, appointed in 1898 to consider the points at issue between the United States and Canada, had adjourned before the close of the last record to meet on January 5, 1899. It consisted of the following members: For the United States, Senator Charles W. Fairbanks of Indiana, Senator George Gray of Delaware, Representative Nelson Dingley of Maine, J. W. Foster of Indiana, J. A. Kasson of Iowa, T. Jefferson Coolidge of Massachusetts; for Canada, Sir Wilfred Laurier, premier of Canada; Sir Louis H. Davies, minister of marine and fisheries; Sir Richard Cartwright, John Charlton, M.P., Baron Herschell, Lord Chancellor of England, and Sir James T. Winter, premier of Newfoundland. Senator Gray resigned September 1, 1898, and was succeeded by Senator Charles J. Faulkner of West Virginia. Mr. Dingley of

John W. Foster. The Late Nelson Dingley Charles W. Fairbanks. The Late Lord Herschell Sir Richard Cartwright John Charlton.

THE BRITISH AMERICAN JOINT HIGH COMMISSION, CHARGED WITH ADJUSTING ALL OPEN QUESTIONS BETWEEN THE UNITED STATES AND CANADA.

Maine, who died in January, 1899, was succeeded by Representative Sereno E. Payne of New York. Lord Herschell, who died in March, 1899, was succeeded by Baron Russell of Killowen. The chief subjects which the commission was to consider were: The Behring sealing question, reciprocal mining regulations, the Alaskan boundary and restrictive regulations for the preservation of the fisheries of the Great Lakes, the North Atlantic fishery question, the boundary question, the alien labor laws, and reciprocity of trade. In its session early in the year no agreement was reached, and the commission adjourned on February 20, 1899, to meet in Quebec on August 2. Its failure to come to any agreement or to recommend the basis of treaty negotiations occasioned much comment at the time, and some unfounded reports that the session had broken up in discord. The only official statement given out was that substantial progress had been made, but that no agreement had been reported on the Alaskan boundary question. The position of the Canadian representatives in this matter was that the dispute should be referred to a board of arbitration with an umpire, as in the case of the Venezuelan dispute, while the United States representatives argued that the case differed from Venezuela, and that the matter should be submitted to six jurists, three for each country, and that no umpire should be called in unless an umpire from the United States. The Canadian representatives would not agree to this or to the contention of the United States that the status of the tide-water settlements in the disputed region should remain unchanged. The continued failure of negotiations for a settlement of the boundary dispute in the summer of 1899 led to an indefinite postponement of the meeting of the commission beyond the appointed date, August 2. A *modus vivendi*, the terms of which were published in June, was proposed, and if it had been adopted would have taken the difficult question of the boundary out of the hands of the commission, and left it free to decide the other points in dispute: but the agreement upon a *modus vivendi* did not come about in time to prevent the indefinite postponement of the meeting of the commission. For an account of the boundary question see the article ALASKAN BOUNDARY QUESTION.

Other Events of the Year.—It was announced in 1899 that Pope Leo XIII. had decided to send an apostolic delegate to the Roman Catholic Church in Canada to have the general care of ecclesiastical affairs in the country, and to be the supreme representative of the Pope, having functions similar to those exercised by the papal delegate to the United States. The appointment fell to Monsignor Falconi. On May 22 the trackmen on the Grand Trunk Railway struck for an increase of wages, and, the strike threatening to become serious, a Parliamentary board of mediation was appointed. Mediation failed, however, and the strike was resumed, but an agreement was reached in June. The railway consented to take back the strikers into its employ, and to discuss the matter of grievances. In August the men, having accepted the concessions made by the railway company, decided not to renew the strike. The strike on the street railways of London, Ontario, led to a serious riot, which necessitated the calling out of troops to quell. The strikers charged the management with breaking their agreement and with discrimination in favor of non-union men. On July 21, 1899, the new suspension bridge over the Niagara River, to replace the structure destroyed in 1864, was formally opened. The plan for a Pacific cable was again discussed in 1899. It was announced in the spring that an agreement had been reached with the Australian colonies and the home government, whereby the expense of the construction would be divided among the three parts of the empire in the following proportion: The Australasians to pay four-ninths, the rest to fall in equal parts upon the Dominion and the imperial governments. A short time afterward, however, the imperial government declared that it would not contribute to the cost of construction upon this basis, but would merely grant a yearly subsidy, not to exceed \$100,000. This occasioned much disappointment, but the imperial government afterward showed a willingness to reopen the question, and in June the colonies were invited to send delegates to discuss the matter with representatives of the imperial government.

The Lumber Question.—One of the most important subjects before the joint high commission was the question of a tariff on lumber. The Canadian view of the matter is as follows: The United States has long been an important market for Canadian lumber, which is used in the paper-making and other industries. The pulp and timber mills of the United States have been largely supplied from the Canadian forests, and American timber-mill owners have purchased large forest tracts in Canada. The Dingley tariff, however, by placing an import duty of \$2 per 1000 feet of sawn lumber, and increasing the import duty on other wood products, has shut out a large part of this important article of export from Canada. Canada had previously demanded that her lumber should be admitted free of duty into the United States. By way of retaliation upon the duty imposed in the Dingley act, the provincial government of Ontario prohibited the manufacture of timber taken from the Ontario crown

lands in any mills not on Canadian soil. Most of the forests purchased by American mill owners were on these crown lands.

CANALS. The most notable occurrence of the year 1899 in canal construction was the opening of the Soulanges Canal, by which the Canadian government completes the last link in its long-projected 14-foot waterway from the head of Lake Superior to the mouth of the St. Lawrence River. This chain of artificial waterways comprise the following canals:

Names of Canals.	Length. Miles.	Number of Locks.	Lockage. Feet.	Distance from preceding Canal.
St. Mary's.....	0.66	1	18
Welland.....	26.75	25	362.75	600 miles
Galops.....	7.625	3	15.5	226 "
Rapids Plat.....	4	2	11.5	4.5 "
Farrens Point.....	0.75	1	4	10.5 "
Cornwall.....	11.5	6	48	5 "
Soulanges.....	14	4	82.5	32.75 "
Lachine.....	8.5	5	45	15.25 "

In the United States the only boat-canal construction of the year, aside from repairs to existing canals, was the completion of the Dismal Swamp Canal, and the continuation of work on the Illinois and Mississippi Canal from Hennepin, Ill., to Rock Island, Ill., 77 miles. This latter canal is being built by the United States government. The Dismal Swamp Canal is 22 miles long, with a depth sufficient for vessels drawing 10 feet of water. It connects Chesapeake Bay with Albermarle Sound, and affords access to about 2500 miles of river and bayou navigation in the Carolinas. It was built by the Lake Drummond Canal and Water Company at a cost of \$1,000,000. The Chicago Drainage Canal, 28 miles long, which has been in process of construction since 1892, was sufficiently advanced toward completion in 1899 to permit water being turned into it. Construction has been progressing actively during the year on the New Orleans, La., drainage canal system, and on the St. Mary's Falls (Mich.) and Massena (N. Y.) water-power canals.

Several projects for canals have developed during the year. Among these the following are worthy of particular mention: Lake Superior-St. Paul Canal, 210 miles long, surveyed in 1899; St. Clair-Erie Canal, length 13 miles, depth 31 feet, width 72 feet, cost \$5,520,000, project revived; Maryland and Delaware Peninsula Canal, project revived; Cape Cod Canal, across Cape Cod, Mass., project revived. In Canada, the Georgiana Bay Canal, from Montreal to Lake Huron, was discussed at various public meetings, but nothing definite was done toward its construction.

Trans-Isthmian canal affairs have received much consideration during the year. Near the close of its session in March, 1899, Congress authorized the President to appoint a commission to investigate all the proposed and possible plans for a canal across the Central American Isthmus, and appropriated the sum of \$1,000,000 for defraying the expense of the study. This commission is now at work with a full corps of engineers. In May, 1899, the commission appointed by the government in 1897 to examine into the same question, submitted its report. This commission approved the Nicaragua Canal route, with some modifications, and reported that the cost of the canal would be \$118,113,790. At present the two most notable of the proposed Isthmian Canal routes are the Nicaragua and Panama. These routes will receive particular attention from the new government commission, but all other routes, of which several have been projected, will be considered, and it is probable also that the commission will conduct independent surveys for one or more new routes. See NICARAGUA CANAL.

As the result of the discovery that the completion of the canal improvements in New York State, for which \$9,000,000 was appropriated in 1895-96, and on which work was discontinued in 1898, after consuming the appropriation, would cost \$16,000,000 more, a special commission was appointed by the governor in 1899 to report upon the general question: What shall New York do with her canals? This commission completed an extended investigation during the year, and is expected to report upon the results of its work and the conclusions which it drew from them early in 1900.

In Europe, the most notable canal work completed and in progress in 1899 was the Bruges Ship Canal, and the Dortmund and Ems Ship Canal. The Bruges Ship Canal runs from Bruges, Belgium, to Heyst, 6 miles, and is now in process of construction. The Dortmund and Ems Canal connects the two German cities of that name and has a total length of 175 miles.

CANARIES, or CANARY ISLANDS, a group of islands lying in the Atlantic Ocean, off the northwest coast of Africa, belong to Spain, and are governed as an

integral province of the kingdom. The principal islands are Teneriffe, Grand Canary, Palma, Gornera, Lanzarote, Fuerteventura, and Hierro, or Ferro. The area of the entire group is 2808 square miles, and the population, which in 1887 was 291,625, is now estimated at 300,000. The population of Teneriffe is about 95,000; Grand Canary, 75,000; Palma, 32,000. The seat of local government and the headquarters for the local administration of the other Spanish possessions along the African coast is Teneriffe. The chief products are potatoes, bananas, tomatoes, and cereals.

CANTWELL, Mgr. NICHOLAS, vicar-general and rector emeritus of the Church of St. Philip de Neri, Philadelphia, died on November 8, 1899, at age of 87 years, being the oldest priest in Pennsylvania. Father Cantwell labored continuously for the Roman Catholic church in Pennsylvania from the time of his ordination in 1841. He was identified with St. Philip de Neri's church for forty-eight years. The title of monsigneur was conferred on him by the Pope about five years before his death.

CAPE COLONY formerly comprised merely the southernmost portion of Africa in the vicinity of the Cape of Good Hope, but has steadily extended its territory to the north until it now includes with its dependencies an area variously estimated at from 277,000 to 292,000 square miles. In it are included, besides Cape Colony proper, the divisions of Griqualand West, East Griqualand, Tembuland, Transkei, and Walfisch Bay, besides the dependencies of Pondoland, annexed in 1894, and having an estimated area of 4040 square miles and a population of 166,080, and British Bechuanaland, formerly a crown colony and annexed in 1895, and having an area of 51,574 square miles and a population of 72,736 (about 76,000 in 1897). Excluding the population of Pondoland and British Bechuanaland, the population of the colony, according to the census of 1891, was 1,527,224, of whom 376,987 were European or white. The Dutch are more numerous in the western portion of the colony and the English in the eastern. The extreme length of the colony from east to west is about 600 miles and its breadth 450 miles. The coast-line is nearly 1200 miles long.

Production.—A range of mountains divides the colony into two parts. This range runs nearly parallel to the coast at a distance of from 150 to 200 miles from the sea. Between the mountains and the sea on the west lie the chief grain and wine-producing districts, and along the southeastern coast tobacco and maize are raised. A lower range of mountains traverses the country from east to west at a shorter distance from the coast, and the land between the two ranges consists of a dry and elevated tract known as the Great Karroo, which is valuable as a grazing region. North of the mountains the table-land of South Africa begins, and this tract, while barren, affords facilities for grazing, and is rich in mineral products. The climate is generally healthful for Europeans. The chief agricultural and animal products are tobacco, wheat, oats, mealies, corn, rye, hay, wool, mohair, butter, ostrich feathers, etc. Agriculture is largely in the hands of the Dutch, while the English are chiefly engaged in the mineral and other industries. In 1891 the industrial establishments numbered 2230, employing 32,735 persons. Recent statistics in regard to the industries are not available, but there are signs of a great increase in their output. The minerals are copper, coal, manganese, lead ore, iron ore, zinc-blende, and diamonds, of which the last named are by far the most important, the diamond mines supplying, it is said, 98 per cent. of the world's market. In 1898 the minerals and metals, exclusive of diamonds, were exported to the value of £15,663,961. The diamond mines are centred at Kimberley, which in the last few years has attained a rank second only to Cape Town in importance. The city of Kimberley lies 647 miles from Cape Town, and has a population, estimated in 1899, at 35,000. The company controls 200,000 acres of land. The mine is sunk in the crater of an extinct volcano, and is now 612 feet deep. Between 1867 and 1897 the total exportation of rough diamonds from Cape Colony was placed at £83,311,087. The value of the diamonds mined in the colony in 1898 was \$17,751,940, the net profit being \$8,651,639. The cost of labor in Cape Colony is extremely high, but this is to some degree offset to the workmen by the high cost of living. There is a tax of 10 shillings, known as a labor tax, imposed upon every able-bodied male inhabitant who cannot show that he is employed during three months of the year.

Commerce.—A large part of the foreign commerce is due to the diamond mines, the product of these mines being the most important article of export and the supplies needed by them forming a large part of the imports. The supplies for the gold mines in the vicinity of Johannesburg also pass through the Cape. The trade has developed rapidly in recent years. The imports increased from £10,760,556 in 1893 to £16,490,739 in 1897 (\$80,127,495). By far the larger part of the imports came from the United Kingdom, which, in 1897, supplied about one-third, but the share of the United States in the trade of the colony has recently increased. The imports

for 1898 were given by the United States consul in 1899 as \$80,890,252, and \$17,883,355 were "in transit for other states." The most important items in the list of imports were machinery, cotton manufactures, haberdashery and millinery, hardware and cutlery, leather and its manufactures, and clothing. The exports in 1898 were given as £25,318,701 (\$123,213,458), as compared with £21,660,210 in 1897. Gold and diamonds made up the greater part of the exports. Statistics for the six months ending June 30, 1899, place the imports at the ports of Cape Colony at \$42,047,420, and the exports at \$68,181,076. The United States consular reports for December, 1899, show the imports into the colony for the month of July to have been \$8,682,643, as against \$6,259,813 in July, 1898, the increase being due to the large imports of specie. The exports for July, 1899, were \$10,594,370, as compared with \$9,670,217 in July, 1898, the increase being due chiefly to shipments of gold and diamonds. In 1899 the imports into Cape Colony amounted to £19,207,549, as against £16,682,438 in the previous year; the exports of 1899 to £23,333,600, as against £25,318,701 in 1898.

It might be supposed that owing to the British-Boer war, trade in the colony was in 1899 largely at a standstill. On the contrary, it is stated in a United States consular report from Cape Town, under date of December 25, 1899, that American trade in South Africa during the previous three months had been good, as evidenced by the receipts of food-stuffs, mules, horses, etc. The American consul-general at Cape Town reported trade activity in many lines and the likelihood of a large demand for American goods after the close of the war. At the close of the year the seaport cities appeared to be benefiting by the war, while the demand for cattle, sheep, vegetables, and forage is such that, with the resulting advance in prices, the agriculturists were also prospering. Lumber had advanced 25 per cent., and furniture was, therefore, expensive. Tenders for bridge-work, electrical and railway material, and machinery were open for bids. Large shipments of fire-extinguishing apparatus were arriving from London. It was needed, on account of the war, for hand engines and to put out fires caused by shells. The imports of electrical materials for October exceeded those during the corresponding month of 1898 by \$30,000. One article of import—namely, wheat—is sent to Cape Colony almost wholly by the United States. The colony does not begin to supply its own food products, and in 1897 there were imported about 184,455,801 pounds of wheat. Of this amount over 178,000,000 pounds came from the United States. In addition, some American wheat came to the colony through England.

Railways, Shipping, etc.—With the commercial and industrial development of the colony the railway facilities have greatly increased in recent years. In 1899 the railway mileage of the colony was nearly 3000 miles, and of this 1990 were owned and worked by the government, which also operated 650 miles of privately owned railways. A later estimate gives the number owned and worked by the government as 2250 miles. Besides this there is a considerable mileage under private ownership and control. It was estimated in January, 1899, that 343 miles of line were under construction. The telegraph line open in 1899 was 7224 miles. Cape Town is now connected by railway with Kimberley and Buluwayo, the latter forming the southern terminus of the great "Cape to Cairo" railway scheme (*q. v.*). The tonnage of vessels entering the ports of the colony in 1897 was 2,694,370, the majority of the vessels being British. The tonnage of vessels engaged in the coast-wise trade was 3,725,831.

Finance.—The public debt in 1899 was £28,377,921. The revenue for 1898 was £6,321,560, and the expenditure £6,817,000. To meet the deficit the government introduced an income and land tax in 1899, which imposes upon the agricultural classes a tax of a halfpenny to the pound above a value of £1200, and upon the non-agricultural class an income tax of one shilling to the pound upon incomes over £300. The tax upon the agriculturists is thus lighter than upon the industrial classes, and the ground for this is that the prevalence of drought and of disease among cattle and sheep render the former calling very precarious in South Africa. It has been feared that the middle class with incomes ranging from £2000 to £3500 would bear the chief burden of this tax. Budget estimates August 1, 1899, for the current year were: Revenue, £6,544,000; expenditure, £6,878,000.

Defence.—The imperial government maintains a contingent in Cape Colony which in 1890 numbered 80,240 non-commissioned officers and men and 545 officers. Besides these there is a force of Cape mounted rifles numbering 1015, a Cape police about 2000, and volunteers to the number of about 7000. A naval squadron is maintained by the imperial government on the South African coast.

Government.—According to the constitution, which dates from 1872, the executive is vested in a governor with a ministry of five members and the legislative authority in a legislative council of 23 members, and a house of assembly of 79 members, which, in 1899, was increased to 95. Members of the upper house hold office for seven and of the assembly for five years, and the members of both houses are paid. There is a property qualification for suffrage. In 1899 the governor, commander-

IN SOUTH AFRICA.

in-chief in the colony, and the high commissioner for South Africa was Sir Alfred Milner.

History.—In the September elections in 1898 the Afrikaner Bond secured a majority in the legislature, and its strength was increased by the elections for the new seats which had been created by the redistribution act. These elections were held early in the year 1899, and they gave the Afrikaner party a majority of 8 over the Progressives and Independents combined, and a majority of 13 over the Progressives alone. From this time on the main interest in the history of Cape Colony centres in its connection with the dispute between England and the Transvaal. Great disappointment was felt in the colony at the failure of the Bloemfontein conference to reach an agreement, but there was no sign as yet of a falling off in the popularity of Sir Alfred Milner. The Afrikaner leaders, however, naturally sympathized with the Boers, although they did their best to influence President Kruger to grant the necessary reform. Mr. Schreiner, the premier, gave many proofs of loyalty to the imperial government, and of an earnest purpose to prevent the inhabitants of the colony from interfering on behalf of the Boers. As the negotiations went on between England and the Transvaal the Afrikaner element showed its sympathy with the latter by emphatically approving the wise and liberal nature of its concessions, while the Progressives declared their approval of the terms proposed by the high commissioner, Sir Alfred Milner, at the Bloemfontein conference. On August 16, the British commander of the Cape troops, Major-General Sir W. E. Butler, was recalled and replaced by Lieutenant-General Sir F. W. E. Forestier-Walker. In the following month Sir Alfred Milner informed President Steyn, of the Orange Free State, that he intended to move the British troops toward the frontier for the purpose of strengthening the lines of approach. He said that this was not intended as a movement against the Free State, and that a friendly settlement of the differences with the Transvaal was hoped for. President Steyn, however, expressed his regret at this movement of the troops, since the citizens of the Free State would surely regard it as a menace, but he added that he would do what he could to prevent an outbreak. When it appeared that war was inevitable there was an influx of refugees into Cape Town, and among them there were many cases of destitution. Some relief was offered by the sum voted by the town council and by the aid of a citizens' movement on their behalf. Funds also came from the Rand, where a relief committee had been formed, and in London the lord mayor opened the Mansion House Fund, which in a comparatively short time accumulated over \$800,000 for the relief of fugitives. After the ultimatum of the Transvaal reached the Cape the high commissioner issued the proclamation that aiding or abetting the enemy during the state of war constituted the crime of high treason, and at the same time the premier, Mr. Schreiner, addressed the citizens in a circular, urging them not to act upon race antagonism and to remain loyal to the imperial government. His policy was to keep Cape Colony out of the war. Cape Colony, however, with Natal, was the scene of the earliest hostilities, and they continued to be the seat of war throughout the year. The first movement of the British was to send all the available troops to De Aar, a junction on the Cape railway system. The British were enforced also at Kimberley and Mafeking, but at Vryburg there was an insufficient force, and it soon fell into the hands of the enemy. Kimberley and Mafeking were cut off from communication with the south by the breaking up of the railway and telegraph lines. Early in November the Boers, having seized the bridges over the Orange River, began to advance in strength into the colony, and the British retreated a short distance before them in order to occupy stronger positions farther south. See TRANSVAAL.

Political and Social Conditions.—The social and political conditions of Cape Colony, so far as they are of importance in connection with the war between England and the Transvaal, include, under the first head, racial and religious questions, and in political matters the possible disaffection of the Cape Boers and Kaffirs through sympathy with the enemy or because of impatience with their present political status. The Afrikaner sentiment has been fostered and stimulated ever since the Great Trek. Nevertheless the condition of the Cape Colony native, whose numeric proportion to whites is about 3 to 1, is still such as to arouse the fear in some minds that he may seize the present opportunity for an uprising. Although there seems to be no reasonable basis for adopting this advanced opinion, the British treatment of the negroes is not entirely a progressive one. The color line in Cape Colony is strongly drawn. The native has no vote and no representation, and in other ways he is treated as a person of little importance. At the same time he must carry a pass wherever he goes, stating his business and destination, and must not be out of his quarters at night. A law discriminating against the negro, under the Glen Grey act, which is enforced in the Lady Frere district, and which is being extended to other native territories, compels many natives to pay nearly six times more for their morgen, or two acres of land, than is paid by the average European farmer of

the colony. This act, however, has its advantages, having secured the land to the natives when there had been an attempt to wrest it from them by the Dutch. Besides the political and social elements, religious questions have been mentioned during the past year as playing a part in the native unrest. A certain missionary, writing in the *Nineteenth Century*, records the growth of the Ethiopian church as a movement, in his opinion, of some magnitude. The Kaffirs dislike, he says, the white missionaries' disapproval of native customs, and there is a strong sentiment among them in favor of making the negro church their own, since they have unequal treatment with the whites and no opportunity for ecclesiastical advancement. In pursuance of this they wish to abolish European church control. In this movement the writer sees another evidence of a slumbering sense of oppression, and dissatisfaction with European methods and rule. From the facts as presented, however, it would seem more like a natural flocking of the negroes by themselves, as in the American colored denominations, rather than an event of political significance. The most important outside element in the population of the English Cape Colony is, of course, that of the Boers, who number, roughly, about 230,000, to 146,000 of British and other Europeans. The political attitude of these colonists is the real matter of concern in considering the possible disaffection of the Cape. In their characteristics the Dutch and British residents are antithetic. The more stolid Dutch are largely pastoral and agricultural farmers, and to some extent are engaged in the cultivation of tobacco and the vine. They are increasing both in total population and their number of voters. The British are largely attracted to the colony by mining and commercial schemes. They live more in the towns and cities, and make up a population of a less permanent, though more progressive, character. Except in the towns there is little fusion of races. In the back country the Boer lives under conditions which are alien to the modern Englishman. Thus there are in a way two nations growing up within the colony, with distinct customs and ideals. Sympathy with the Transvaalers on the part of the Cape Colony Dutch would not be surprising, therefore, should it be actively shown. Some writers are of the opinion also that the historic sentiment for a Dutch republic, embracing all South Africa, still exists among the Transvaal, Free State, Natal, and Cape descendants of the Dutch who settled within the old Cape Colony, south of the Orange River, years ago. It has even been asserted that proof of this is in the possession of the English colonial office. If these facts are true it means that President Kruger really has the support of his compatriots in the Cape and other British colonies. The reported sympathy at heart between the Cape and Transvaal Dutch was, in fact, disclosed before the ending of the year.

"CAPE TO CAIRO" RAILWAY is the title by which the project of Mr. Cecil Rhodes for a line to traverse the entire length of the continent of Africa is known, although Alexandria and not Cairo is planned for its northern terminus. When Mr. Rhodes proposed a telegraph line from the Cape to Cairo some years ago the project found small favor with investors. Nevertheless the telegraph line has made great progress, and in 1899 was being pushed forward to the southern end of Lake Tanganyika. The total distance to be covered is 6600 miles. Mr. Rhodes started from the northern limit of the Cape telegraph system and built through Bechuanaland as far as Buluwayo and a point in Mashonaland, a distance of 1800 miles from the Cape. From northeastern Mashonaland it passes northward across Portuguese territory, passing over the Zambesi River at Tete, and joining the telegraphic system of Nyassaland at Blantyre, thence it passes northward and along the western shore of Lake Nyassa to Karonga on its western coast, which it reached in December, 1898. Thence it runs westward to the southern point of Lake Tanganyika, which was reported to have been reached in 1899. A large section of the system had already been built in the north by the Egyptian government under the control of British officers. It extends through Wady Halfa as far as Khartoum, 1300 miles from Cairo. The southern portion of this line was inoperative during a period of the Mahdi's domination, but the Khartoum telegraph office was reopened when the Anglo-Egyptian expedition reached that point in 1898. Subtracting the 1300 miles already constructed in the north and 2500 miles from the Cape to Abercorn, at the southern end of Lake Tanganyika, there remain only 2800 miles to be constructed. In 1899 it was said that the line would be finished in five years' time. Its financial prospects were good, the chief practical result of it being a reduction of the cost of telegraphing to South Africa, which is from 84 cents to \$1.20 a word. As to the cost it has been estimated at \$375 a mile on the average, and on this basis the total cost would be less than \$2,500,000. At Abercorn it will pass through German territory to the east of Lake Tanganyika, and then enter British territory again, and pass near Mengo in Uganda, and northward until it joins the Anglo-Egyptian line on the frontier of the Soudan. Thus only 700 miles of its course would pass through German territory. Permission to construct the line on German land was granted by the German government, but on the condition, it was said, that Mr. Rhodes should

lay down at his own cost a separate line between Rhodesia and British East Africa, which should be under the exclusive control of the German authorities, and which should be operated by them at his expense. At the end of forty years the German government might appropriate the line without compensation. The railway project involves far greater difficulty and its prospects are more doubtful. It has been criticised on the ground that it could not be worked except at a loss, and that there are other points in the African continent which are in far greater need of railway communication than Cape Colony and Cairo. Moreover, it has been estimated that the shortening of the distance between London and the Cape would be a matter of only two or three days. At present, including the four or five days between London and Cairo, the journey to the Cape by sea takes only seventeen or eighteen days, and the overland route would reduce the time to fifteen or sixteen days. The cost has been placed by some as high as \$100,000,000. At the same time it seemed probable in 1899 that the work would be carried out, and the date commonly given for its completion was 1909. There are two sections of the line now practically complete, one in the north from Cairo to Khartoum and the other in the south. Mr. Rhodes has been the chief factor in the construction of the southern section. He began by building a line from Vryburg in Bechuanaland to Buluwayo in Rhodesia, a distance of 600 miles. In this the railway company was subsidized by the chartered South Africa Company, and the cost was about \$10,000,000, toward which the home government contributed \$1,000,000. The next step is now being taken. It consists in the extension of the Bechuanaland Railway to the mineral region of Rhodesia, a section which would need to be built whether or not the greater project was carried out. This line is in process of construction. It will cross the Zambesi at a point near the Portuguese frontier. Mr. Rhodes expects to carry the road across the Zambesi in five years. The line north of this point is all a matter of vague speculation. From the Zambesi it is proposed to carry it northward to the west of Zumbo, between Lake Bangweolo and Nyassa to the southern point of Lake Tanganyika, at which point it will enter German territory. In 1899 Mr. Rhodes visited the German Emperor to obtain permission to carry the line through his African lands. No authenticated report of the results of the interview was made public, but it was said that while the Germans would guarantee no material aid, they consented to the passage of the line through their territory. The northern section of the road was carried forward as a part of the Anglo-Egyptian campaign in 1897 and 1898. As Lord Kitchener advanced into the interior he constructed the railway line toward Khartoum, completing it as far as the Atbara. At this point progress was checked by the necessity of building a bridge. It was necessary to finish the work before the July floods, but the bids offered by British bridge-builders called for too long a space of time. Fresh bids were invited, and an American firm received the order, having engaged to build the work in a space of time and at a price which the British builders could not approach. Seven spans for the bridge were on their way from New York harbor within the thirty-seven days after the receipt of the order. The line from the Atbara to Khartoum is now in process of construction. From Khartoum the direction of the road has not yet been settled. The mileage required to complete the line through the intermediate space is variously estimated according to the extent to which it is proposed to rely upon the water-ways. If the waters of Lake Nyassa, Lake Tanganyika, and Lake Victoria Nyanza were utilized about 1100 miles would be gained, and the total number of miles required for establishing complete connection would be about 1750. If the Nile were traversed from Khartoum to the Albert Nyanza 750 more miles would be gained, and the mileage necessary for completion of the line would be about 1000, but Mr. Rhodes' project appears to call for the building of a line over this 750 miles. Throughout the eastern part of Africa, running from Suakim down to Table Mountain, there is a series of mountain ranges from which the country to the eastward falls rapidly to the coast. To the west it slopes gradually toward the great plateaus of the interior. The "Cape to Cairo" railway would run for the most part along the crest of this plateau, which, on the whole, is the most healthful portion of Africa. Native labor, which would be the main reliance in the building of the road, is not only cheap, but efficient, as appears from the experience of railway building in the south. A large part of the line would lie in the country of the Bantus, who are one of the most intelligent and progressive races of Africa. A matter of great importance is the extent to which side lines would connect the Trans-Continental Railway with the coast. Of these side lines the following are already built or in process of construction: First, the Natal Railway, from Durban into the Transvaal; second, the Delagoa Bay Railway from Delagoa Bay to the interior of the Transvaal; third, the Beira Railway, entering Rhodesia at Umtali, whence there is communication with Salisbury; fourth, the German East African Railway from the seacoast to the western part of the German protectorate, with branches to Lake Tanganyika and Lake Victoria Nyanza; fifth, the British East African Railway, from

Mombasa to the Victoria Nyanza, a part of which has been built. No further eastward branches would tap the main line to the north of this British East African Railway, and the sea would not be reached except at Suakim, to which a line is proposed either via Kassala or via Berber. Of the eastward branches, two are in process of construction and two are merely proposed. The two now built are a Portuguese line extending from St. Paul de Loanda toward Lake Tanganyika, and a Belgian line extending from Matadi toward Uganda. The two proposed are to connect Lake Tchad with Fashoda and Walfisch with Buluwayo. The cost of building the new portions of the Trans-Continental line is estimated by Mr. Rhodes at \$50,000,000, which is regarded by some as a too sanguine estimate, since the engineering difficulties in the central section would be far greater than in the sections already built.

CAPE VERDE ISLANDS, a group of fourteen islands belonging to Portugal and lying about 320 miles west of the cape from which they take their name, have an area of from 1480 to 1650 square miles, with a population estimated at from 114,130 to 120,000, consisting of a mixed race of Portuguese and negroes, the negro element predominating. The chief products are sugar, cotton, coffee, tobacco, tamarinds, indigo, millet, and medicinal products. Portugal is the chief sharer in the commerce, which in 1896 amounted to about \$2,141,000. There is a trade with the United States in goat-skins, rum, and salt, and the islands import from the United States flour, lumber, Indian corn, and denims. The islands are administered by a governor, whose residence is at Praia, the capital.

CAPRIVI DE CAPRARA DE MONTECUCOLI, Count GEORG LEO VON, the successor of Bismarck as chancellor of the German Empire, died at Skyren, near Krossen, February 6, 1899. Caprivi had an international reputation as soldier and statesman, and in Germany was one of the powerful forces of his time, though he was overshadowed by his contemporaries, Von Moltke and Bismarck, the one in the army and the other in the state. He was born February 24, 1831, in Berlin, where he was educated. In April, 1849, he entered the Kaiser Franz Grenadiers; in 1850, having meanwhile attended the military college, he was made second lieutenant; in 1859 was promoted to the rank of first lieutenant; in 1861 to that of captain on the general staff, and in 1865 he was placed in command of a company in the Sixty-fourth Regiment. He was made a major in 1866, and served as a staff-officer of the First Army Corps in Bohemia; in 1870 he was given a lieutenant-colonelcy, and served as chief of staff of the Tenth Army Corps, which position he held during the Franco-Prussian War. He distinguished himself at Metz and Orleans, and in the following Loire campaign. He was commissioned colonel in 1872, having supervision of a bureau under the war department. He was advanced to the rank of major-general in 1877, and in the following year had command of a brigade at Stettin and of a brigade at Berlin in 1881. In December, 1882, he was made lieutenant-general and commander of the Thirtieth Infantry Corps at Metz. After the resignation of Admiral Stosch, Caprivi was made chief of the ministry of marine in March, 1883, and was given the rank of vice-admiral. On account of his inexperience in the navy this appointment caused much dissatisfaction among the naval officers. But he showed such knowledge and mastery in the department that all fears on account of any supposed inability were allayed. He reorganized the navy department, and placed it on its present footing. He gave much attention to the development of torpedoes and torpedo boats, to the improvement of naval tactics, and to plans for the more rapid mobilization of warships. He resigned in 1888 and was made commanding general of the Tenth Army Corps in Hanover.

In March, 1890, he was appointed by Kaiser William II. to succeed Bismarck as imperial chancellor and president of the Prussian council. As chancellor the career of Caprivi was troubled, but he performed his duties with great faithfulness. Despite much opposition, he carried the German army bill successfully through both the Reichstag and the Prussian Landtag. In 1892 he incurred the hostility of German landowners by effecting with Austria, Italy, and Russia reciprocity treaties which allowed the competition of foreign cereals in Germany, and thus reduced prices on these staples. By a high protective tariff Bismarck had kept out such competition. Of course, the change was welcomed largely by the manufacturing and non-agricultural parts of the population, and though at one time Caprivi bitterly opposed the Socialists, he was finally accused by the landed aristocracy of showing them favor. The truth, doubtless, is not that he favored Socialism, but that he saw the folly of the extreme anti-Socialistic measures. In 1892 he resigned the presidency of the council and the chancellorship in 1894.

Caprivi was a member of the order of the Black Eagle. He was made a count by the Emperor in 1891. Both in physique and in character he resembled to some extent his great predecessor in the chancellorship, Bismarck. Like the latter, he was a man of force and will, but in address was more agreeable. He combined sagacity with

more of patience and good-humor than Bismarck, and in general was far more of a favorite. Upon hearing of his death Emperor William telegraphed to General von Müller, Capri's nephew: "Count Capri was always highly esteemed as a soldier by his commanders-in-chief. As imperial chancellor he co-operated with me, and manifested delight in his work and fidelity to his convictions. In the seclusion of his retirement he continued to show that he could deserve recognition and the gratitude of his King and Emperor."

CARBORUNDUM. The production of carborundum in the United States in 1899 was about 1,632,407 pounds, and its use as a substitute for emery and corundum showed a decided advance. Besides its growing use as an abrasive, the new material has been employed as a substitute for ferrosilicon in steel manufacture, and in its amorphous form as a refractory lining for furnaces and in the manufacture of refractory bricks, crucibles, etc. The manufacture of carborundum is controlled by one company having a plant at Niagara Falls, N. Y.

CARDINAL. In the Roman Catholic Church the cardinals—bishops, priests, and deacons—are next in dignity to the Pope, and the new popes are elected from the list of cardinals. The names and dates of consecration are given in the subjoined list:

Cardinal Bishops: C. Mazzella (1886); M. Mocenni (1893); L. M. Parocchi (1877); G. Prisco (1896); L. O. S. Stefano (1873); S. Vannutelli (1887). Cardinal Priests: A. Agliardi (1896); Masella Aloisi (1885); A. Capececiatro (1885); G. Casali del Drago (1899); A. M. Cassajares (1895); S. Cassanas (1895); F. Cassetta (1899); P. Clesia (1884); A. Ciasca (1899); L. Conille (1897); S. Cretoni (1896); L. di Canossa (1897); A. di Pietro (1893); A. Ferrari (1894); D. Ferrata (1896); G. Francica Nava (1899); S. Gabati (1890); J. Gibbons (1886); Goossens (1889); G. M. Gotti (1895); A. J. Gruscha (1891); T. Haller (1895); T. Herrera (1897); D. M. Jacobini (1896); G. Kopp (1893); F. Laboure (1897); B. M. Laugenieux (1886); V. L. Lecot (1893); M. Ledochowski (1872); Michael Logue (1893); A. Manara (1895); F. Mathieu (1899); J. Missia (1899); P. F. Moran (1885); J. S. Netto (1884); J. Portanova (1899); M. Rampolla (1887); P. Respighi (1899); F. M. Richard (1889); A. Richelmy (1899); C. M. Sancha (1894); J. Sarto (1893); F. Satolli (1895); L. Schlauch (1893); D. Svampa (1894); V. Vannutelli (1890); H. Vaughan (1893); C. Vaszary (1893). Cardinal Deacons: L. Macchi (1889); R. Pierotti; F. Segna (1894); A. Steinhuber (1895); L. Trombetta (1891); J. Vives y Tuto (1899).

CARLOS, DON, DUKE OF MADRID, grand-nephew of Ferdinand VII., who claims the Spanish throne on the ground that Isabella, daughter of Ferdinand VII. and mother of Alfonso XII., was debarred from the succession owing to the Salic law, was born at Laybach, Austria, March 30, 1848. His grandfather and uncle (Charles V. and Charles VII.) took up arms in their cause. Don Juan, the father of Don Carlos, yielded his rights to this son in 1868, and the standard of the latter was raised in Spain in 1872. Don Carlos entered Spain July 15, 1873, and waged war with great vigor. In 1876 Tolosa fell and the Carlists fled to France. Don Carlos crossed to London and sailed for the United States and Mexico. In 1877 he served in the Russian army in Turkey, and was decorated by the Czar for his services. In 1880 he went to France, but President Grévy expelled him for attending mass with the Royalists in honor of the Comte de Chambord. In 1884 he visited India and in 1887 South America. Don Carlos lives principally in his palace in Venice, and it is said that he awaits a favorable opportunity for reasserting his old claim to the Spanish throne. As undisputed heir of the House of Bourbon (his father having died in 1887) he has also a right to the throne of France, and has frequently been urged by the Royalists to bring his claim forward. His first wife was Marguerite, Princess of Bourbon-Parma, and his second wife Marie-Berthe, Princess de Rohan. Don Carlos has five children, his heir being the Infante, Don Jaime, Prince of the Asturias, born June 27, 1870.

CARNEGIE, ANDREW, manufacturer and philanthropist, was born in Dunfermline, Scotland, in 1835, his family emigrating to the United States in 1845 and settling in Allegheny, Penn. He made a fortune in oil, became interested in iron works at Pittsburg, and soon became known as the largest manufacturer of iron, steel rails, and coke in the world. His public gifts are very large, including many endowments and the establishment of a large number of libraries in this country and Scotland, and aggregated in 1899 millions of dollars. Some of his larger gifts include the Carnegie Institute at Pittsburg, endowed at \$3,000,000, but in receipt, all told, of about \$7,000,000; a similar institution at Allegheny, \$300,000; the Braddock, Homestead, and Duquesne institutes in Pennsylvania, \$500,000 each, and the Washington, Carnegie, Edinburgh, and Pennsylvania State College libraries. Altogether he has founded more than twenty libraries, half of which are in Scotland. Among his gifts in 1899 may be mentioned a very large endowment for a technical department at Birmingham University, England, on the plan of the American technical schools;

gifts to Stevens Institute; to the Carnegie Library; toward establishing a library at Banff, Scotland, and a large gift to the Atlanta, Ga., public library. In May, 1899, the announcement was made that Mr. Carnegie was to retire from active business and sell to his business associates his controlling interest in the great iron and steel plants under his management, which were to be consolidated under one concern. It was reported that \$150,000,000 was the sum to be received for these interests. The reported sale attracted great attention both in this country and abroad, but in November it was announced that the proposed reorganization of the various companies had been abandoned, and that Mr. Carnegie would continue to direct the business, no change being made in organization, ownership, or policy. In December the retirement of Mr. H. C. Frick from the chairmanship of the Carnegie Steel Company was announced. Besides his prominence in business and as a philanthropist, Mr. Carnegie is known as a writer, among his publications being *An American Four-in-Hand in Britain*; *Round the World*, and *Triumphant Democracy*. In 1899 he contributed a number of articles to American magazines opposing the policy of the administration in the Philippines.

CAROLINE ISLANDS, an archipelago in the Pacific Ocean, extending between the 3d and 11th parallels of north latitude and from the 133d east meridian to the 167th, a distance of more than 2000 miles. The islands were under Spanish authority from 1885 to 1899. On February 12 of the latter year a treaty was signed between Spain and Germany, according to the terms of which the Carolines, together with Ladrões, or Marianne Islands (except Guam), were sold to the latter power for the sum of 25,000,000 pesetas (\$4,825,000), and the purchase was formally announced by the Spanish and German governments early in June. The group was put under the governor of German New Guinea. The total area of the Carolines is about 560 square miles, and the estimated population, 36,000. The islands are about 500 in number, and comprise 36 small groups, the chief ones being the Pelews, or Palaos, Yap, Uluthi, Uleai, Namonuito, Ruk, or Hugoleu, the Mortlocks, Ponapé, or Bonabé, and Kusaie, sometimes known as Ualan, or Strong's Island. There is a European settlement at Tomil Harbor, in the Pelews, one of the western groups. The chief port and trading place of the Uluthi group is Arrowroot, or Mokomok. On Ponapé, one of the most important islands of the eastern group, there is a small Spanish colony at Santiago, on Asuncion Bay. The commercial products of the islands are few and unimportant; they include turtle-shell, copra, and *bêche de mer*, while fruits, especially yam, bread fruit, and cocoanuts, are grown in large quantities.

The natives are a mixed race, apparently being "a cross between round-headed, light-colored Malay folk and the long-headed, almost black, crisp-haired, earlier islanders, the so-called Melanesians." The inhabitants of the various islands present different characteristics, some being surly and suspicious and others kindly and hospitable, but all are alike in having a strong hatred for the Spaniard.

When the Spanish flag was raised in the archipelago there were in Ponapé and some of the other islands flourishing Methodist missions, and within a year Roman Catholic missions were introduced, which finally brought about the expulsion of the Protestants and the confiscation of mission property, for which in 1890 Spain was obliged by the United States government to pay an indemnity of \$17,000. From 1887 till 1899 the natives made intermittent revolts against the Spaniards. In a few of the islands, particularly Ponapé and Ualan, there are groups of ruins, which are the work of a race unknown to the present inhabitants. These remains of a pre-historic time consist chiefly of breakwaters, canals, and massive stone fortifications. In Ponapé the stone constructions, which are generally rectangular in form, cover an area of about eleven square miles, the exterior walls being from eight to ten feet thick and sometimes forty feet high, and enclosing canals and some fifty walled islets. These enclosures, protected from the sea by the massive walls and breakwaters, seem to have been designed for fortresses, temples, and mausoleums. According to native legend, their construction is attributed to the supernatural agency of two deified heroes—Olo-chipa and Olo-chopa. Apparently the stones, which are natural prisms of basalt, and many of which weigh several tons, were brought by raft from the north side of the island and then by means of inclined planes and rollers were placed in position, being arranged in alternation longitudinally and transversely. There is a legend in Ponapé that the earlier culture was destroyed by a fierce race, whose leader became the war-god, called Ichok-kalakal by the present inhabitants.

CAROLUS-DURAN. See DURAN, ÉMILE AUGUSTE CAROLUS.

CARPENTER, CHARLES C., rear-admiral, U.S.N., retired, committed suicide at a sanitarium in Jamaica Plain, Mass., April 2, 1899. He was born at Greenfield, Mass., February 27, 1834; entered the navy as midshipman in 1850; in 1855-56 was in the Naval Academy at Annapolis, and in 1858 became a lieutenant. He was attached to the steamer *Mohawk*, which, after the outbreak of the Civil War, was

placed in the Texas and the East Gulf blockading squadron. In 1862 Carpenter was transferred to the *Flag*, of the South Atlantic squadron, and in July was promoted to the rank of lieutenant-commander. The next year he was serving on the monitor *Catskill* when that boat took part in the attacks upon Charleston, S. C., in April, July, and August. During the latter part of the war he was at the Naval Academy. When hostilities were ended he was sent to the Asiatic station, where he received his first command, the *Wyoming*. He returned to America, and was stationed at the Portsmouth Navy Yard for two years, during which time he was commissioned commander. He commanded the *Nantasket* in 1871-72, and then returned to Portsmouth, serving on equipment duty for three years. In 1875-76 he commanded the *Huron*, of the North Atlantic squadron, when he again resumed duty at Portsmouth, where he was promoted to the rank of captain in March, 1880. After three years of shore duty at the Boston Navy Yard he took command of the *Hartford*, which carried the English and American eclipse expedition to the Caroline atoll. From 1888 to 1890 he commanded the receiving-ship *Wabash*, and in June of the latter year was transferred to Portsmouth, where he was made captain of the yard, becoming later commandant. In 1893 he was commissioned commodore, and rear-admiral in 1894. In this year as commander of the Asiatic squadron he witnessed several naval movements of the Chino-Japanese war. He was retired in 1896. Upon the outbreak of the Spanish-American war the offer of his services was accepted by Secretary of the Navy Long, and he was assigned to his old command of the Portsmouth Yard, relieving Commodore Remey, who in turn was given command of the naval station at Key West.

CARS. See RAILWAYS (paragraph Cars).

CASTELAR, EMILIO, Spanish statesman and author, was born in Cadiz, September 8, 1832; died at Murcia, Spain, May 25, 1899. In early life he was left in straitened circumstances, but secured a good education. While still a boy he wrote much, and in his early twenties gained no small reputation for his political orations, the opinions expressed at this time being of an advanced radical nature. In 1856 he was appointed professor of history in the University of Madrid. His career, now fairly begun, proved to be a remarkable one for its political journalism, oratory, statesmanship, authorship, and activity in the cause of republicanism in Spain. In 1864, with Carrasen, he founded *La Democracia*, a radical paper, and thereby lost his professorship in the university. Two years later the publication was suppressed, and Castelar, having taken part in the uprising against the government (June, 1866), was sentenced to death, but he succeeded in escaping to Geneva. Upon the outbreak of the revolution of 1868 he returned to Spain, became a leader of the republican party, and resumed his professorship at Madrid. Castelar protested against the restoration of the monarchy and demanded the proclamation of a republic. He was unsuccessful, however, and though he was returned to the Cortes, the republicans were generally beaten at the polls, and the next year (1870) the Duke of Aosta was proclaimed king as Amadeo I. Upon the abdication of Amadeo two years later, a republic was proclaimed, and Castelar became premier and minister of foreign affairs. He was elected to the presidency of the Cortes in August, 1873, but resigned the following month upon his nomination for president of the republic. Being elected to this office, he assumed an autocratic position; his task was by no means an easy one, for he had to meet the insubordination of his generals and the menacing attempts of the Carlists. When the Cortes reassembled in January, 1874, a vote of confidence in Castelar was defeated, whereupon he resigned. This was the beginning of the end of the republic, and on December 14, 1874, Alfonso XII. ascended the throne of the restored kingdom. Castelar went to Switzerland, resigning the chair of history in the university. He subsequently became, however, a leader in the Spanish republican party, and to the last remained one of the chief exponents of democratic ideas in Spain, though in his latest years his influence in politics was greatly diminished. Upon his retirement from public life in 1893, he said that the monarchy was the only stable form of government possible for Spain. He was formerly a great admirer of the United States, but vehemently denounced this country when it espoused the Cuban cause. In April, 1899, Castelar was elected to the Cortes from Murcia, but he declined to serve. His writings include novels, histories, books of travel, essays, poems, parliamentary discourses, many of which have been read widely in Europe and America. Among these may be mentioned a life of Columbus and *Old Rome and New Italy*. Castelar was eminent as an orator, and as a writer, like so many other Spaniards, was notable for a florid style.

CASTNER, HAMILTON YOUNG, American chemist, died at Saranac Lake, N. Y., October 11, 1899. He was born Brooklyn, N. Y., September 11, 1859. After receiving a common school education he entered the Columbia College School of Mines and was graduated in 1878. Having devoted himself especially to chemistry, he opened an analytical laboratory in New York City. He gave his attention par-

ticularly to the improvement of chemical processes, and some of his inventions have been of much value. He succeeded in finding a method by which carbon could be produced continuously; he improved the chemical process for the production of aluminium, and later succeeded in finding an electrolytic method for the manufacture of bicarbonate of soda. Besides these, he developed or originated many processes. Mr. Castner supervised the erection of the aluminium plant at Oldbury, England, and was associated with the Castner-Kellner Company, the Malthiessen Alkali Company, the Rheinfelsen Company, and the Niagara Chemical Company.

CATARGI, LASCAR, Roumanian statesman, died at Bucharest, April 11, 1899. He was born in Moldavia in November, 1823. He entered politics, and rose to the position of premier. He held this office from 1891 to 1895. When the union of the Danubian principalities, Wallachia and Moldavia, was formed, and under the name Roumania the two were acknowledged by the Porte in 1861, Catargi was prominent in effecting the consolidation of the new nationality.

CAUCASUS, a Russian lieutenancy, lying on both sides of the mountain range of the same name, which extends between the Black Sea and the Caspian. It has an area of 180,843 square miles and a population, according to the census of 1897, of 9,248,695, with a density of 54 per square mile. The ratio between the sexes was 89.5 women for every 100 men. There is a great variety of ethnic elements, the Russians being the most numerous, the Tartars next, and the Armenians next. Besides these, there are Turks, Northern Tartars, Persians, Georgians, Mingrelians, Imeretes, Ossets, etc. The birth rate, based on the statistics of 1895, was 41.3 and the death rate, 26.1.

CAVENDISH. See JONES, HENRY.

CELEBES, a large island of the East Indies, lying in the Pacific Ocean, east of Borneo, and having an area of 71,470 square miles, with a population roughly estimated at the end of 1897 at 2,000,000. The whole of the island is practically under the control of the Dutch, who, however, administer directly only a small portion, and in the other parts permit the petty princes to manage local affairs. It is divided into two residencies in accordance with the Dutch system for the administration of the colony. The part of the island which is directly under the Dutch administration forms an "outpost" of Dutch India. It constitutes the towns of Mendo, Port Rotterdam, and Vlaardingen or Macassar. A somewhat similar system to that existing in Java (*q. v.*) is employed in Celebes for the purpose of solving the labor question. After the introduction of the coffee plant the village chiefs were induced to undertake the work of cultivation. These chiefs were to receive five per cent. of the produce. It was sold at a fixed price to the government. The industry progressed rapidly, and the country was opened up by roads and supplied with clothing and luxuries. The system of *controleurs* was introduced. This consisted in assigning to each district into which the country was divided a controller, who was a European, or a native of European blood, as the superintendent of the cultivation of the district and the general adviser of the chief and the go-between for local interests and the government.

CEMENTS. See HYDRAULIC CEMENTS.

CENSUS IN THE UNITED STATES. In the last session of the Fifty-fifth Congress an act was passed providing for the taking of the Twelfth Census in 1900. This act created a census bureau to which civil service rules were not extended. The three hundred supervisors who will have charge of the 40,000 enumerators in the different districts are to be appointed by the President and confirmed by the Senate. The clerks at the census office, together with all the other employees authorized by the act below the assistant director, are to be appointed by the director, subject to such an examination as he may prescribe, but no examination is to be required for those positions for which a salary less than \$600 is paid. On March 4, 1899, ex-Governor William R. Merriam, of Minnesota, was nominated director, and shortly afterward Mr. Frederick Howard Wines, of Illinois, was nominated assistant director. Ex-Governor Merriam, while having no special qualification as a statistician, had been a successful business man and state official. Assistant Director F. H. Wines was a special agent of the Tenth and Eleventh Censuses and is a well-known statistician and the author of *Punishment and Reformation*. The technical and scientific portion of the work will be done by the assistant director. A general statement was issued by Mr. Merriam, outlining the policy of the office in making appointments. He declared that the appointments would be based upon fitness, and that as much regard would be paid to the merits of candidates as if the civil service rules were in force.

Administrative Organization.—The Census law of 1899 is in some respects superior to any previous census acts. It makes a sharp distinction between the executive and statistical branches of the work. It provides for the prompt completion of those

lines of investigation which have been the chief objects of the censuses, and postpones the more special work until this has been done. It provides for a director at a salary of \$6000 a year, who has the general charge of the administration, and an assistant director at \$4000, who is a trained statistician and who has the general oversight of the statistical bureaus. There are also five chief statisticians, each of whom is in charge of a special branch of the work, and has been chosen with reference to his attainments in that branch. For the completion of the four principal subjects of census investigation—namely, population, vital statistics, agriculture, and manufactures—two years from June, 1900, have been allotted. The 300 supervisors provided for in the law have charge of the work in the various census districts and choose the enumerators, of whom the director estimates there will be between 40,000 and 50,000. The actual account must be completed, according to the law, within fifteen days in the cities and thirty days in the country districts, and the enumeration districts are not to comprise a population of more than 2000. These supervisors were chosen in 1899 in the hope that by appointing them early they would be enabled to perform their duties within the required time. The value of the work depends in large degree upon the character of these supervisors, and one of the defects of every census has been the difficulty of securing suitable men for work which is not permanent in character. The plans for the census, so far as they were formulated in 1899, look to greater centralization of the system. It was proposed that instead of scattering the operators among nine or ten buildings in Washington, and in some cases having the work done away from the city, there should be a special administration building provided. For the preliminary work it was estimated that from 2800 to 3000 clerks, messengers, and other employees would be required. The director gives the following account of some of the striking features and new processes of the work which will be done in the census building in Washington: "The large space in the single-story part of the building has been divided into two separate rooms; each of these rooms will hold about 1000 clerks. Between these two rooms will be the fire-proof vault above referred to, and also a room for storing the cards which are to be used in connection with the tabulating machine. There will be about 100,000,000 of these cards. It is proposed to employ about 1000 clerks in transferring data from enumerators' sheets to cards about three by six inches in size. This is done by first preparing a card for each person enumerated, showing all the characteristics of such person. The cards used for this purpose are printed with letters and symbols so arranged that by punching holes in the proper spaces we get the following information regarding each individual: Race, sex, color, age, conjugal condition, birthplace of person, of father, mother, years in the United States, occupation, school attendance, etc. These cards, though only 7-1000ths of an inch in thickness, would form a stack, if piled one on another, about nine miles high, and they will weigh about two hundred tons.

"This transcript from the original returns of the enumerator to the punched card will be done with small machines, something like typewriters, called keyboard punchers. About 1000 of these will be used, and the entire work of transcribing the 75,000,000 or more individual records will be done in about one hundred working days, or nearly four months.

"These punched record cards are then counted, or tabulated, in the electrical tabulating machines. These machines are provided with a circuit-closing device, into which the cards are rapidly fed, one by one. The holes in the card control the electric circuits through a number of counters, which will, as desired, count the simple facts as to the number of males, females, etc., or the most complicated combination which the statistician may ask for. After the cards for a given district are thus passed through the tabulating machine, we know the number of native-born white males of voting age, the number of white children under five years of age born in this country with both parents native-born, or the number of such children with one or both parents foreign-born, or any other information contained in the enumerators' sheet which the statistician desires tabulated. In short, it is only necessary for the statistician to decide upon the information wanted, and for the electrician to make the proper connection from the counters and relays to the circuit-controlling device into which the cards are fed. The methods employed for checking the proper workings of the machines are ingenious and interesting. If the card is not completely punched, or not properly fed to the machine, or is placed upside down, or if some item has been overlooked, or, in fact, if everything is not all right, the machine refuses to work, and the card is rejected. Neither will the machine work if the circuit-controlling device is operated without a card in place. Such a machine also has the advantage that it will not make mistakes because it is tired or does not feel well, or because the weather is warm, or by reason of the thousand and one causes which will upset the human machine."

After the four chief subjects above mentioned have been completed and published under the title of Census Reports the statistics upon a great variety of special

subjects will be gathered. Among these especial subjects are the following: The insane, feeble-minded, deaf, dumb, and blind; crimes, pauperism, and benevolence; social statistics of cities; public indebtedness, valuation, and expenditure; electric light and power, telephone and telegraph business, transportation by water, express business, and street railway, and mines and mining. The title of these reports when published will be Special Census Reports.

The Law of 1899.—The main points of difference between the law of 1899 and that establishing the Eleventh Census have been summarized above, but the following more detailed account of these differences may be of interest. In the first place the law of 1899 defines the scope of the census somewhat differently from that of 1889. The latter called it a census "of the population, wealth, and industry of the United States," while the former termed it a census "of the population, of deaths, and of the manufacturing, mechanical, and agricultural products of the United States." The law of 1899 further established several new officers. Among others was the assistant director of the census above mentioned and the five chief statisticians, "who will be persons of known and tried experience in statistical work, at an annual salary of \$3000 each." In the matter of examinations the earlier act merely stated that all examinations for appointment and promotion should be in the discretion and under the direction of the secretary of the interior, while the act of 1899 provided that the chief clerk, the chief statistician, and the other employees below the assistant director of the census should be appointed by the director of the census, subject to such examination as he might prescribe, provided, however, that no examination should be required in the case of the enumerators or special agents, or of employees below the grade of skilled laborers at \$600 a year. The act of 1889 provided that the same schedules of inquiries should be used in the Eleventh Census as in the Tenth Census, subject to such modifications as might be approved by the secretary of the interior. The law of 1899 defined the schedule of inquiries and strictly limited their scope. In section seven it stated that "the Twelfth Census shall be restricted to inquiries relating to the population, to mortality, to the products of agriculture, and of manufacturing and mechanical establishments." The inquiries in regard to population for the Twelfth Census comprise the following points for each inhabitant: name, age, color, sex, conjugal condition, birthplace, birthplace of parents, whether alien or naturalized, number of years in the United States, occupation, months unemployed, literacy, school attendance, and ownership of farms or homes. The inquiries in regard to mortality comprised the name, sex, color, age, conjugal condition, birthplace, birthplace of parents, occupation, cause and date of death, and date of birth in the case of children born within the census year. Inquiries relating to agriculture comprise name of occupant of each farm, color, tenure, acreage, value of farm and improvements, acreage by products, quantity and value of products, number and value of live stock. Inquiries relating to manufactures comprise name and location of each establishment; character of organization, whether individual, co-operative, etc.; date of beginning operations; character of business or kind of goods manufactured; capital invested, number of proprietors, firm members, co-partners, or officers, and the amount of their salaries; number of employees and the amount of their wages; quantity and cost of materials used in manufactures; amount of miscellaneous expenses; quantity and value of products; time in operation during the census year; character and quantity of power used, and character and number of machines employed. The law of 1889 included a large number of subjects on which volumes should be prepared and published. Among these subjects were social statistics, mining, valuation, and public indebtedness; railway, express, telegraph, insurance statistics, and several other matters. The law establishing the Twelfth Census provided that the census reports proper should comprise only subjects relating to population, mortality and vital statistics, the products of agriculture, and of manufacturing and mechanical establishments. This is the work of the census proper, and these reports are to be issued not later than the 1st of July, 1902. The preparation of the Special Census Reports is rightly deferred until after the completion of this regular work. The complete list of topics to be covered by the Special Census Reports is as follows: The insane, feeble-minded, deaf, dumb, and blind; crimes, pauperism, and benevolence, including prisoners, paupers, juvenile delinquents, and inmates of the benevolent and reformatory institutions; deaths and births in registration areas; social statistics of cities; public indebtedness, valuation, and expenditure; religious bodies; electric light and power, telephone and telegraph business; transportation by water, express business, and street railway; mines and mining and minerals, and the production and value thereof, including gold, in divisions of placer and vein, and silver mines and the number of men employed, and the average daily wage, average working time and aggregate earnings in the various branches. For these there is no limitation of time proposed, except in the case of mining and mineral statistics, which must be published on or before July 1, 1903.

Method and Scope.—The American Economic Association appointed a committee

in 1897 to report on the scope and method of the federal census. This committee presented its report in the annual meeting of the association on December 28, 1898, and a brief summary was given in the last YEAR BOOK. In March, 1899, the association published this report, together with many special papers dealing with the various departments of the census. Taken together these papers form a body of criticism and suggestions in regard to the census-taking that surpass in value anything that has been before published. Their general tone was favorable to the plans adopted for the taking of the Twelfth Census, although it was not expected that the defects of previous censuses would be entirely avoided. The main fault found with the present method of census-taking in the United States is based on the temporary nature of the system. The inadequate and provisional system which was sufficient for the comparatively simple purposes of the older censuses is continued. Down to 1850 census work consisted in a mere enumeration of the number of persons in each family, according to their color, sex, and age, with the addition from time to time of a few other details. A temporary arrangement for the census at the end of each decennial period was sufficient, but, since that date, the scope of the census has greatly extended, and has come to include a great variety of facts in regard to the individual, as well as scores of inquiries relating to such subjects as agriculture, mortality, schools, libraries, churches, newspapers, and wealth. The extension of the schedules of inquiry made it impossible to do the work by means of marshals and assistant marshals without some central organization, and since 1850 the census laws have provided for a superintendent and have created a temporary census office. Between 1860 and 1870 a clerk was retained in charge of the census records, and between 1870 and 1880 not only the chief clerk but the superintendent was retained, the latter serving without pay. The Tenth Census, that of 1880, was badly executed, owing to the resignation of the superintendent and the death of his successor. The work was still incomplete when the census office was abolished by law in 1885. A census division was established in its place, and a portion of the census force continued their work, which lasted very nearly until 1890. The work of the census of 1890 was less cyclopædic in scope, since it was more strictly statistical, and included less historical and technological matter, but it followed up nearly as many lines of inquiry, and its published reports were as voluminous. All through the history of census-taking in the United States the work has suffered from its fitful character and the inadequate length of time allowed by law for preparation. The census of 1900 will suffer from these defects. In some respects, however, it has an advantage over the preceding censuses. In the first place, it cannot cover the whole range of subjects, but must first dispose of the four chief topics above mentioned. In the second place, it may distribute the work on the remaining topics over the entire interval of ten years, if need be. The special work is not to be allowed to interfere with the preparation of the census reports proper. In the third place, there is a better organization, since the director has been enabled to secure the services of an assistant director and of the five chief statisticians. It is thought that this will lighten his preliminary duties, and enable him to secure expert assistants in the subordinate offices. Fourthly, the reduction of the subjects to be investigated by the enumerators is thought to be a great advantage. At the Eleventh Census, that of 1890, it is said that the inquiries to which the enumerators were required to obtain answers numbered nearly 700. The work of the enumerators will be lightened not only in this way, but by calling in expert and special agents to collect the kind of data which cannot well be obtained in the ordinary house-to-house canvass. Another gain is expected to result from the provision for 300 supervisors in 1900. There were only 150 supervisors at the census of 1880 and 175 at that of 1890. The effect of this will be to reduce the districts in which the supervisors will have charge to manageable limits. The director also may, if he see fit, assign the work of enumeration to resident supervisors especially appointed for that purpose. As to the number of enumeration districts, it has been estimated by the director of the census that there will be about 50,000. This would give a much smaller average for the districts than was the case in preceding censuses, with the result of more accurate knowledge and a quicker completion of the work. The law of 1899 gives the director the discretionary power as to the number and form of the necessary inquiries. He will thus be able to limit the scope of the inquiries in order to insure the return of the data within the period fixed by law. It is thought to be more advantageous to limit the number of topics upon which information is sought for than to attempt to secure answers to a great variety of inquiries for which the time allowed is inadequate. As soon as the results of the account are received at Washington the work of tabulation will begin. A vast army of clerks is necessary for this purpose, and as a result of the temporary nature of the system these assistants must be organized and trained, since very few will have had any experience in this specific work of census-taking. At the census of 1890 the civil service rules applied to the clerical force of the executive department, but the census clerks and other employees were excluded. Their examination was in

the hands of the secretary of the interior, who appointed a board of examiners for the purpose. Clerical appointments for the census of 1900 are made upon a somewhat similar system, but the law provides that if an examination is prescribed it shall relate only to the fitness of the applicant for the particular duties of the office for which he seeks appointment. The argument for the exclusion of this class of candidates from civil service rules is that the work, being of a special and temporary nature, the eligible lists of the civil service commission would not supply the necessary force. Again, it has been stated that a fairly good test was applied to the applicants for work on the census of 1890. Apart from the objections urged by civil service reformers against the exclusion of the appointees from civil service rules, there is the further complaint that the method established by the law of 1899 entails much unnecessary personal work on the part of the director. The advantage which has been claimed for the new census law is that the director will have better means of securing the services of expert statisticians. To sum up the criticism that has been made upon the Twelfth Census: the chief defects are, as in previous censuses, the lack of time for preparation and the lack of a trained force of employees. It has been repeatedly said that to these two general causes almost all the serious defects of previous censuses can be traced. On the other hand, the Twelfth Census marks an advance over the previous censuses in the points briefly outlined above.

The Enumeration.—The selection of the enumerators for the 50,000 enumeration districts into which the country has been divided is made only after the applicant has shown his ability to fill out the blank schedule properly from the facts which he ascertained from the answers of the person questioned. It is expected that a higher grade of ability for enumerators will be secured than in the 1890 census. The work of enumeration is simplified by the fact that no enumerator will have to carry more than four schedules, whereas in the previous census he had to carry and understand from ten to thirteen. The questions asked are practically identical with those of the last two censuses, but the following questions, which were asked in 1890, have been omitted: "(1) Whether a soldier, sailor, or marine during the Civil War (United States or Confederate), or widow of such person. (2) Whether suffering from acute or chronic disease, with name of disease and length of time afflicted. (3) Whether defective in mind, sight, hearing, or speech, or whether crippled, maimed, or deformed, with name of defect. (4) Whether a prisoner, convict, homeless child, or pauper." One difficulty in the way of securing accuracy has been the fact that in the large cities many persons are away during the month of June, in which the census is required by law to be taken. The present system provides that any city enumerator shall report the houses which he finds closed on his rounds and the work of ascertaining the facts in regard to the residents of such vacant houses shall be assigned to a special enumerator, who shall discharge this duty by visiting the place of business or by correspondence.

CENTRAL ASIA. See ASIA; AFGHANISTAN; THIBET.

CERAM, one of the largest of the Molucca Islands, lies to the west of New Guinea, and has an area of about 7015 square miles and an estimated population of 100,000. On the night of November 2, 1899, the island suffered a terrific earthquake, which moved from north to south, and was probably one of the series of seismic disturbances that occurred about the same time on the Japanese coast and adjacent islands. The shock induced a tidal wave, which rushed up the bay of Ambonia and stood some fifty feet over the lowlands. For miles the conformation of the coast was changed and the inland topography was greatly altered. Five thousand persons were known to have perished, and it is likely that the number was much larger.

CEYLON is a large island and British colony in the Indian Ocean, to the south-east of the peninsula of Hindoostan. Between it and the peninsula lie the Gulf of Manaar and Palk's Strait, but the chain of reefs known as Adam's Bridge almost spans these waters. It has an area of 25,305 square miles and a population estimated in the middle of 1897 at 3,391,443, of whom 6545 were Europeans, 23,663 descendants of Europeans, while the most numerous element of the natives were the Singhalese, who numbered 2,174,200. Other tribes are the Tamil immigrants and settlers, numbering 960,745; the Moormen—that is, the non-Malay Mohammedans, numbering 205,588—and Malays, Veddahs, and other races. A large part of the island is under cultivation, the largest acreage being under cocoanut trees, the next under rice and other grains, and some 404,000 acres being under tea. These crops, together with coffee, cinnamon, tobacco, cinchona, etc., are the main products. Among the minerals, plumbago is important. Pearl-diving was formerly a very productive industry, yielding in 1891, 960,000 rupees, but since that date it has been of no importance. The chief exports are tea, cocoanut products, plumbago, coffee, areca nuts, and cinchona; and the chief imports are cotton goods, salt fish, rice and other

JOSEPH CHAMBERLAIN.

grain, coal and coke, wines, spirits, etc. In 1897 the revenue was 24,006,522 rupees; expenditure, 21,634,378 rupees. The chief items of revenue are customs, licenses, sale of government timber and salt, stamps, receipts from the government railway, etc. The railway mileage in 1897 was 1217. The lines pass through very uneven country, which varies from sea level at Colombo to an altitude of 6300 feet near Nanwoya. The executive is vested in a governor and a council of five members, and the legislative in a council of seventeen members. The religion of the majority of the inhabitants is Buddhism, which is the faith of the Singhalese. Next to these in point of numbers are the Hindoos, and next the Christians and Mohammedans. The governor in 1899 was the Right Hon. Sir Joseph West Ridgeway, who was appointed in 1895.

CHAFFEE, ADNA ROMANZA, major-general United States volunteers, who was stationed in Havana early in 1899, was born in Orwell, O., April 14, 1842. He was educated in the public schools, and in 1861 entered the army, serving as a private and sergeant until he was made second lieutenant of the Sixth Cavalry. He became first lieutenant in 1865, captain in 1867, major Ninth Cavalry in 1888, and lieutenant-colonel Third Cavalry in 1897. He was brevetted first lieutenant in 1863 for gallantry at Gettysburg; captain for gallantry at Dinwiddie Court House, Va., in 1865; major in 1868 for gallantry while serving against the Comanche Indians in Texas, and lieutenant-colonel for gallantry against the Indians in Texas and Arizona in 1898. In that year he was appointed brigadier-general of United States volunteers, and served in the Santiago campaign. In July of that year he was made major-general of volunteers.

CHAMBERLAIN, JOSEPH, English secretary of state for the colonies, was prominent in 1899 by reason of his treatment of the difficulties arising with the South African Republic. He was born in London in July, 1836; was educated at University College, London, and entered his father's manufacturing business in Birmingham. Three times he was elected mayor of this city, and in 1876 represented it in Parliament. He is a Liberal Unionist. He sat for Birmingham until 1885 and thereafter for Birmingham West. From 1880 to 1885 he was president of the board of trade, with cabinet rank; after the election of 1885 he held the office of president of the local government board until his divergence of views on Gladstone's Irish policy brought about his resignation, March 27, 1886. He has been very active in politics, and on the formation of the coalition ministry in June, 1895, he became colonial secretary under Lord Salisbury. As a cabinet officer he has shown much energy and has endeavored to bring about closer commercial relations between Great Britain and the colonies. In 1897 he was to no small extent instrumental in effecting the passage through the Commons of the Workingmen's Compensation Act. For several years his colonial policy has been so vigorous that more moderate statesmen have called him a "jingo." In 1898 he declared himself in favor of an alliance with the United States. Mr. Chamberlain was censured in many quarters in 1899 for what some alleged was a persistently harassing and an unnecessary policy toward the South African Republic. For an account of his negotiations with President Kruger, see **TRANSVAAL** (paragraphs on History).

CHAPELLE, PLACIDE LOUIS, Roman Catholic archbishop and apostolic delegate to the Roman Catholic Church in Cuba and Puerto Rico, was born in France, August 28, 1842. In 1859 he came to this country and studied theology and philosophy in St. Mary's College. In 1865 he was ordained priest, and engaged in missionary work. He became pastor of St. John's and St. Joseph's Church in Baltimore and of St. Matthew's in Washington, and presided over important theological conferences in those cities. He was made an archbishop in 1893, and in 1894 became archbishop of Santa Fé, and in 1897 archbishop of New Orleans. The Pope appointed him apostolic delegate to Cuba and Puerto Rico in 1898, and he entered upon his new mission in January, 1899.

CHARITIES. *Outdoor Relief.*—There was much discussion in the year 1899 of the problems connected with outdoor relief. An examination of the duty of the municipal governments of the forty largest cities in the United States was made by Mr. Frederick Almy, and the results were published in the *Charities Review* for March and April, 1899. The extent of the public and private outdoor relief in these cities and the ratio of one to the other are illustrated by this writer in the following table:

PUBLIC AND PRIVATE OUTDOOR RELIEF IN THE UNITED STATES.

	Popula- tion. (1898.)	Public outdoor relief. (1897.)	Private outdoor relief.	Public out- door relief. Per capita.	Private out- door relief. Per capita.	Total out- door relief. Per capita.
New York	2,000,000	None	\$323,606	\$0.00	\$0.164	\$0.164
Chicago	1,800,000	\$136,200	100,000	.08	.055	.135

Cambridge	87,000	4,770	12,733	.05	.150	.200

The figures for private outdoor relief are necessarily inexact, since it was found impossible to obtain exhaustive and precise returns. It appears from these tables that ten of these larger cities give no public outdoor relief; that where they give little or no public outdoor relief this deficiency is in almost all cases supplemented by private relief, and that in almost all cases where private relief is not given an increased burden rests upon the government. So the general result of the examination was to bear out what had been formerly supposed—namely, that a city which gave no public outdoor relief must give a considerable amount of private outdoor relief, and that, *vice versa*, where there is no private relief public relief must take its place. The question whether liberal public relief tends to check private charity also receives an answer from these figures. Where the public outdoor relief is liberal the private relief is not, and, *vice versa*, wherever cities give liberally for private outdoor relief there is not liberal public outdoor relief. Thus, a balance between the two appears to be established. The per capita amount necessary for outdoor relief varies greatly in the different cities, as appears from the table. The important point here is whether the per capita amount increases as one or the other of the systems prevails. The conclusion of the writer is that the average per capita rate of the cities which depend wholly upon private relief is 6½ cents, and of those which depend wholly upon public relief is 17½ cents. He finds from the study of the statistics of Buffalo and Boston, where charity organization societies have been long established, but where public outdoor relief is also given lavishly, that the investigations are not prudently conducted and that the expenditure is excessive. The general result of the examination was that the abolition of public outdoor relief is desirable, but that a private general relief society must be established to take its place.

State Legislation, 1899.—The chief legislation adopted in the States during the year on the subject of charities and correction in general may be summarized as follows: In Indiana a new law provides for the appointment of a board of charities and correction by the circuit court on petition of fifteen citizens, this board to visit

and inspect all the charitable and correctional institutions of the State and to report thereon to the county commissioners and State Board of Charities. In New Hampshire the legislative act authorizes the governor and council to appoint three commissioners to consider the subject of "State support and control of the dependent, insane, and feeble-minded, and methods for moral improvement in the penal institutions of the State." In New York the State comptroller and the president of the State Board of Charities have been authorized to classify and fix the salaries of officers and employees of charitable and reformatory institutions. In Wisconsin the State Board of Control has been directed to inspect semiannually the sanitary condition of the county asylums, poorhouses, and jails. A Texas law establishes the office of purchasing agent for charitable institutions. On the specific subject of poor relief an Indiana law directs the overseers of the poor to co-operate with private organizations and keep informed concerning their work, in order to prevent the unnecessary duplication of relief and the giving of misguided and useless alms. In Arkansas the practice of letting out paupers to the lowest bidder who gives bond to provide them with shelter, food, and medical attendance has been authorized by law. In Arizona the supervisors of the poor are permitted by law to contract with other counties for the care of the county poor, and in Minnesota a law permits the establishment of district poorhouses in two or more counties of a joint population of 25,000. The two last enactments were based on the view that better facilities and a more fitting classification of paupers could be obtained by the consolidation of county poorhouses. In the matter of dependent and neglected children, general laws in Illinois, West Virginia, Washington, and Wyoming practically recognize the duty of the State to interfere. In New Jersey a law creates a State board of children's guardians, to have the oversight of all dependent children.

Epileptics.—The recent movement to give the State the especial charge of the care and treatment of epileptics made considerable progress in 1899. The first State to act upon this principle was Ohio, which opened an asylum for epileptics in 1893. This practice was followed by the governments of Massachusetts, California, and New Jersey. In New York the Craig colony for epileptics was established in 1894. In 1899 epileptic colonies were established in Illinois and Missouri. Texas established an asylum for epileptics, and in North Dakota the way was opened for State interference in this matter by the reference to the next legislature of a constitutional amendment for the formation of an institution for the feeble-minded. Figures showing the status of these epileptic colonies during the year were not available, but the following facts show the recent progress at the Craig colony in New York. The 322 colonists in the institution on October 1, 1898, were increased during the succeeding year by 95 new cases, while during the same period 39 were discharged and died or were transferred to other institutions. The number in the colony on October 1, 1899, was 378. The death rate during the year was less than two per cent. An improvement in a large number of cases was reported in 1899, in spite of the fact that epilepsy is so infrequently cured. Even where cures were not absolutely effected there was a marked reduction in the number and violence of seizures and a great improvement in physical condition. It was further reported that the colonists were becoming more useful factors in the work of the colony, and that the idea of colony life was gaining ground. A group of eleven buildings were completed in the course of the year. The educational work was conducted with good results. It included kindergarten work, a night school, nature study, manual training, Sloyd instruction, and industrial and trade schools.

Charity Organization.—The object of charity organization is to secure co-operation on the part of existing charitable institutions. Charity organization societies are federations composed of representatives of the various charitable bodies. They have been formed in nearly a hundred cities in the United States. The chief purposes of these federations have been classified as follows: First, co-operation; second, the gaining of adequate knowledge; and third, the enlistment of personal volunteer service. The advantage of co-operation in preventing duplication of work and in promoting the efficiency of charitable relief is at once obvious. It provides for the interchange of information, and the importance of this in some of our large cities may be inferred from the fact that in New York City 531 co-operating societies and churches exchange information through the registration bureau of the New York Charity Organization Society. As to the obtaining of adequate knowledge, the systematic methods rendered possible by charity organization promote economy and bring better results. They lessen the opportunities for fraud and they enable the societies to ascertain more fully the nature of the relief needed and the best means of affording it. The element of personal service is considered the most important part of charity organization work. It directs philanthropy into safe channels. It prevents the kind of harm that well-meaning persons often do by giving undeserved alms. At the same time it retains the benefit of friendly visiting and of contact between the well-to-do and the poor. The friendly visitors under the charity organization system are not allowed to give alms. The question of affording that sort of re-

lief is decided at headquarters. The principle of charity organization is the well-established one that the poor should be helped to help themselves, and its main work is to find employment for deserving applicants, and if this is impossible to employ them in its own labor yards and work rooms at a low rate of wages. In all cases it seeks to apply a labor test. Charity organization societies are not associations for the purpose of giving relief in the form of alms. There are cases of distress in which they do give alms, but their real purpose is to find the cause of indigence and to remove it. They are strongly opposed to any form of indiscriminate almsgiving, which they consider worse than a waste of money, since it lowers the moral character of the poor. They deny the principle that it is better to give to nine unworthy applicants than to pass by one deserving case. As to the granting of outdoor relief by public agencies, the charity organization workers hold that it is a wasteful policy on the ground that it increases the number of applicants, calls for an impossible degree of discrimination and results in lowering wages. Some American cities have done away with public outdoor relief. Brooklyn, for example, abolished it in 1878, and the efficient work of the Charity Organization Society, which was founded in that year, seems to have more than offset the absence of this form of relief. The case of Philadelphia, which abolished its public outdoor relief in 1879, after the Charity Organization Society was founded there, is cited as another instance of the economy and efficiency of the new system. It is the opinion of prominent writers on charity in the United States that outdoor relief "educates more persons for the almshouse than it keeps out of it." A recent writer points out the attitude of the economists toward charity organization. The chief features of the economic discussion on this point may be briefly outlined as follows: The classical school of English economists, with their faith in the doctrine of *laissez-faire*, found no place in their philosophy for altruistic motives, although some of them, like Malthus, advocated a form of voluntary and active charity which would tend to unite the rich with the poor, and John Stuart Mill drew attention to the fact "that energy and self-dependence are liable to be impaired by the absence of help as well as by its excess." Malthus favored private charity in preference to state relief, while Mill held the opposite opinion. There was little consistency among the members of the old school, and a good many of them made no attempt to define the relations of charity to economic science. The later economists in their wider view of the scope of their science have recognized the principles of charitable work as a fit subject for economic inquiry, and this subject now forms a part of almost every systematic treatise on economics. At the present time economic opinion is divided upon the questions of charitable relief, but the limited views of the old-school doctrinaire are no longer widely held. Some of the economists in England have opposed the idea of the charity organization societies that public outdoor relief is injurious, and they hold that while this practice would have been detrimental in earlier times, it is capable of beneficent results under the improved modern conditions. Thus these economists carry their ideas of the scope of charities farther than do many of the practical philanthropists. On the other hand, there are still exponents of the *laissez-faire* theory. Of these the most famous example is Herbert Spencer, who holds that the relief of the poor at the public expense is unethical and that organized voluntary charity is nearly as bad. He would dispense with charitable institutions and rely solely on personal giving—that is, on the relief which a man might feel it his duty to afford to persons with whom he came in immediate contact. His general attitude is that charity checks material progress, and he says it is hard to see how assistance to the poor can prevent "the inferior from begetting more of the inferior." His one argument for charity seems to be the effect upon the giver and not upon the recipient. It may make for progress, according to him, on account of its effect upon the emotional and æsthetic side of man's nature. In other words, this is the view that charity, while economically bad, may yet be ethically desirable. Others who also belong to the minority argue that a charity which is economically injurious is ethically wrong, and claim that the unwise sympathy, which does not take account of harmful results, cannot be ethically justified. Others again argue that any charity which is demanded by a sound ethical sentiment is justified whatever be its effect upon material progress. In general, philanthropy has become more scientific on the one hand, and economics have paid more attention to philanthropy on the other hand. The ethical basis of charity is not denied by most writers of the present day, nor are the economic effects taken as the sole criterion. It is not disputed that even those charities of the past which were least defensible on economic grounds may have furthered the progress of civilization by educating men in altruism. At the same time the wider and more systematic knowledge of charities to-day do not justify the repetition of those mistakes. The good intention does not prevent the harm. Practical duties will change with advancing knowledge of social laws. Charity organization attempts to afford a scientific outlet for the ethical impulse.

CHARITY ORGANIZATION SOCIETY, organized 1882 for the purpose of

improving the condition of the poor by the systematic investigation of cases of distress. The New York City society spends no money in almsgiving, none of its funds being used for relief, but only for the directing of needy persons to places where they may obtain it. This society, in the year ending June, 1899, reports 12,894 cases recorded; receipts, \$54,327. President, Robert W. De Forest; secretary, Edward T. Devine, 105 East Twenty-second Street, New York City. The organ of this society is *Charities*, and an annual *Directory of Charities of New York City* is published. There are 112 charity organization societies in various cities of the United States. See CHARITIES.

CHAUDORDY, JEAN BAPTISTE ALEXANDRE DAMAZE, COMTE DE, French diplomat, died March 26, 1899. He was born December 4, 1826, and entered the diplomatic service in 1851 as attaché of the French embassy at Rome, of which he became five years later the secretary. During the next six years he held a similar position successively at Weimar, Madrid, Copenhagen, and Carlsruhe. In 1862 he was made under-secretary in the French cabinet, and was appointed minister to Spain in 1868. As a representative of the French foreign office he published in 1871 a series of circulars, addressed to the powers, refuting accusations made by Bismarck that France had violated the terms of the Geneva convention. After the Franco-Prussian war he served two years in the Chamber of Deputies as a representative of Lot-et-Garonne, when he was appointed ambassador to Switzerland, from which post he was transferred less than a year later to Madrid. In 1876 he became a commander of the Legion of Honor. Among his writings are: *The Political Status of the French Nation*; *France Following the War of 1870-71*; *France in 1880*.

CHAUTAUQUA SYSTEM OF EDUCATION, originated in 1874, is composed of the Chautauqua Assembly, holding annual meetings in July and August at Chautauqua, N. Y., at which sessions courses of instruction are given in various branches of learning, together with lectures, recitals, concerts, etc.; and the Chautauqua Literary and Scientific Circle, which has enrolled, up to 1899, more than 250,000 members. The latter is designed to give local opportunities for study by the formation of circles pursuing a four years' course of study prescribed by the directors of the Assembly. President, Clem. Studebaker, South Bend, Ill.; secretary, W. A. Duncan, Syracuse, N. Y. The number of students in the summer school in 1899 was 2262. Principal of instruction, Dr. George E. Vincent, 5737 Lexington Avenue, Chicago, Ill. The publications are: *The Chautauquan*, Chautauqua Literary and Scientific Circle books, and the *Chautauqua Assembly Daily Herald*. Meeting for 1900 at Chautauqua, June 27 to August 24.

CHEMICAL SOCIETY, AMERICAN, organized 1876, in 1899 had 1569 members. Secretary, Albert C. Hale, Ph.D., 551 Putnam Avenue, Brooklyn, N. Y. City.

CHEMISTRY. The wonderful progress made in the study of science during the century so soon to close was ably discussed in the presidential address of Sir Michael Foster at the meeting of the British Association, held in Dover in September, 1899. He contrasted in bold outlines the status of the science of chemistry in 1799 and in 1899, saying: "We have only to read the scientific literature of the time to recognize that a truth which is now not only woven as a master thread into all our scientific conceptions, but even enters largely into the every-day talk and thoughts of educated people, was a hundred years ago struggling into existence among the philosophers themselves. It was all but absolutely unknown to the large world outside those select few." Chemistry is essentially a science of the nineteenth century, and the activity in it is not excelled by any other branch of learning. It is taught in every college and university in the country; it is practised in connection with every important industry; and there are chemical laboratories connected with every State experiment station, with every board of health, and in many municipalities. It is becoming more and more rare that a striking discovery is made in chemistry; progress is continual and persistent, but it is rather a development of a closer study of details. Methods of analysis are being improved both as regards accuracy and rapidity; this leads to a more precise knowledge of the composition of things. In organic chemistry gaps in well-known series of compounds are being filled, and in technology processes are continually modified in accordance with the most recent information. As an illustration of the ramifications in industrial chemistry may be cited the classes into which that branch has been subdivided for the Congress to be held in Paris in 1900: 1. Analytical chemistry; 2. Inorganic products; 3. Metallurgy, mines, explosives; 4. Organic products; 5. Sugar industry; 6. Fermentations; 7. Agricultural chemistry, fertilizers, cattle feeding, dairy; 8. Hygiene, medical, and pharmaceutical chemistry; 9. Photography; and, 10. Electro-chemistry. These facts are cited to show the practical impossibility of any adequate review of the details of the progress in chemistry as a whole for a year.

American Chemical Society.—In this country the largest body of chemists is the American Chemical Society (*q. v.*), with 1569 members. It held two meetings dur-

ing 1899, one at Columbus, O., contemporaneous with the American Association for the Advancement of Science, when nine papers were read and discussed. The address of Frank P. Venable before the section of chemistry of the American Association attracted some attention. It was an able review of our knowledge of the constitution of matter. He pointed out the increasing number of fallacies in the atomic theory, and presented the growing arguments in favor of the theory that elements are only varieties of one original kind of matter; thus raising the question as to whether it was not time seriously to reconsider certain of the fundamental beliefs of chemists. A second meeting was held in New Haven, Conn., during December 27-28, at which twenty-one papers were presented.

Theoretical Chemistry.—Among the announcements made in theoretical chemistry in the year 1899 may be mentioned the startling communication presented before the British Association by J. J. Thompson, in which he discussed the existence of masses smaller than atoms. He finds that the charge carried by an atom in cathode discharges and similar phenomena is apparently one thousand times greater than in ordinary electrolysis; consequently either the atoms become disassociated and only a portion of their mass carries the negative charges of cathode rays, or else the atom can receive a greater charge than is assigned to it in explaining electrolytic phenomena. The division of the spectra of certain elements in series of lines would tend to suppose a belief in the complex nature of elements. There is a continued activity in the extension of the limits of temperature. Dewar in his experiments with liquid hydrogen has reached the point of 21° C. above absolute zero, a degree of cold which has four times the frigorific potency of liquid air. Liquid hydrogen is a limpid fluid, clear as water, but possessing only one-fourteenth as much specific gravity. Air freezes and sinks into it, and a cork sinks in it as lead does in water. Dewar's experiment confirms the existence of helium and neon, but fails to corroborate the existence of metargon, xenon, and krypton. It is believed that 20° C. is the lowest temperature that it is possible to reach by present methods. Turning to high temperatures, Moissan continues his researches, using the electric furnace of his own invention. A temperature of 3500° C. has been obtained by him, and during the year he has devoted much attention to calcium compounds. More recently he has returned to the electrolytic preparation of fluorine, an element which was known only in combination until isolated by him. The production of silicon, both in its crystalline and graphitoid form, is reported by Hyde and by De Chalmot, both of whom obtained their results by using the electric furnace.

New Elements.—Of these, no very remarkable announcements can be made; victorium is the only one discovered during the year. It was obtained by Crookes from the earths of the cerium group. It is described as a pale, brown-colored earth, easily soluble in acids and less basic than yttria. Assuming its oxide to have the formula Vi_2O_3 , the atomic weight will be about 117. It was named in honor of Queen Victoria. Nasini and his associates, in making a spectroscopic examination of the solfatara of Pozzuoli and Vesuvius, claim to find the spectra of argon, coronium, and other elements. The existence of certain unknown lines lead them to suspect the presence of new gaseous elements. Further announcements of unknown bodies have been made in Paris as having been obtained in examining complex minerals by means of the Becquerel rays. The place of the new constituents of the atmosphere in the periodic system proposed by Mendeleeff continues an undecided question, and Howe argues that they are to be considered the first elements of the eighth group in Mendeleeff's table.

Atomic Weights.—There has been continued activity in the redetermining of the atomic weights of the elements, and during the year revisions have been published as follows: Boron, 11.016; nitrogen, 14.031; nickel, 58.709; cobalt, 58.998; molybdenum, 96.069; palladium, 107.014; and cerium, 138.81.

Inorganic Chemistry.—In this branch of chemical science progress has been steady, and perhaps the most promising announcement is that made by F. W. Clarke, who, in studying the action of ammonium chloride upon silicates, has obtained some new compounds of an unusual character. He finds that analcite or leucite heated to 350° C. with ammonium chloride in a sealed tube yields ammonium leucite, which is perfectly stable at 300° C. All the zeolites yield similar derivations; so that it is now possible to replace fixed alkalis by ammonium in many silicates and to get compounds capable of splitting up upon ignition in such manner as to shed light on their chemical constitution. Ammonium silicates have been hitherto unknown.

Physical Chemistry.—It has been said recently that "physical chemistry is the chemistry of the future," and in no branch of chemistry have greater advances been made in recent years. J. H. van't Hoff is the recognized leader in this specialty, and this chemist and the students under him have devoted much attention to the deposition of the soluble constituents of sea water during the year. Tammann is the author of some very important contributions on the limits of the solid state. He has discussed at considerable length the probable general form of the melting-point curve,

and reaches a conclusion that no gradual change from crystalline to liquid condition can occur, and hence that the general form is probably that of a closed curve. He further shows that there is no sudden change in the physical properties of a substance as it changes from a liquid to a solid state, unless the solid phase be crystalline; therefore he would restrict the term solid to crystalline substances alone, and regard amorphous solids as under-cooled liquids. Bodenstein has devoted considerable time to the study of the gaseous reactions in chemical kinetics. Duhem fails to agree with the last-named authority, and has himself studied the mathematical theory of equilibria in heterogeneous and homogeneous systems.

Organic Chemistry.—Organic chemistry is the subdivision which continues to receive the greatest attention from students, especially in the laboratories in German universities. Von Baeyer, to whom we owe the synthetical production of indigo, continues actively at work on the subject of orientation in the benzene ring, with special reference to the terpenes. Schiff is another worker in this same field, who also has devoted much attention to the same subject. The constitution of inorganic compounds is the general title of a series of elaborate investigations by Werner, Megerle, Pastor, and Spruck, whose most recent publication treats of compounds of ethylenediamine and propylenediamine with salt of bivalent metals. A. Fock has published an important paper on the crystallographic relations of optically active substances and their racemic compounds. He finds that optically active substances may be divided into three groups: First, those with no racemic compounds, the two antipodes crystallizing separately from the mixed solution; second, those in which the antipodes unite in constant proportions to form a racemic compound; and third, those in which the antipodes unite in varying proportions to form numerous racemic or pseudo-racemic compounds. A most important contribution has been the extended work by Elbs and Kopp on the electrolytic synthesis of organic compounds, and in this same field Edgar F. Smith, of the University of Pennsylvania, has been an active worker during recent years. By far the most striking contribution published during the year is the paper by Markownikoff on *Derivatives of the Naphthene or Cyclohexane Series*, in which he discusses general methods for the dilution of physical isomers in mixtures of the same. W. A. Noyes, of Terre Haute, Ind., has continued during the year his classic work on camphoric acid, and his published results have given him a high standing among American workers in organic chemistry.

Industrial Chemistry.—In the domain of industrial chemistry, or, as it is sometimes called, chemistry applied to the arts, there has been steady progress during the year, although it has been chiefly in the direction of increased production rather than of striking novelties. Perhaps the most important advance has been in the employment of electrical power for chemical and metallurgical processes, and nowhere has this progress been greater than in the United States. An estimate published in Germany, giving the value of possible products to be manufactured by electro-chemical processes, shows the figures for the United States to be \$97,500,000; the next is that of Germany, which is given as \$13,750,000, followed by France with \$11,250,000. The values of the individual products in the United States are as follows: Copper, \$56,250,000; silver, \$28,350,000; gold, \$4,900,000; calcium carbide, \$4,500,000, and aluminium, \$2,625,000. In regard to actual processes the continued application of the cyanide process for the extraction of gold is important, and in some of the improved methods yields of 90 per cent. are reported. The desilverization of lead by electrolysis continues to be improved, and excellent results are reported by the method introduced by Tomasi. In copper the use of the Herreshoff progressive and continuous roasting furnace is growing, and the extension of the Hoepfner method for the extraction of that metal is reported. Improvements in Mond's process for the extraction of nickel have been described during the year, and the process of Goldschmidt for obtaining high temperatures and the reduction of refractory metallic oxides by combustion of aluminium has been further developed. The total abolition of the vitriol chamber in the manufacture of sulphuric acid, patents for which were obtained by the Badische Anilin and Soda Fabrik during the year, is described by Lunge as "the greatest revolution which has taken place since that acid became a commercial product." The principal feature of this improvement is the discovery that it is necessary to get rid of the heat of the reaction in order to obtain a quantitative union of sulphur dioxide and oxygen forming sulphur trioxide, and that under such circumstances a complete union is obtained, even when using ordinary dilute technical gases, such as result from pyrite burners. The application of electrolytic methods to the production of chlorine and its compounds continues to increase, and seems to mark the passing of the Leblanc process for the manufacture of soda ash, as that important article is now so extensively produced by the ammonia-soda process. The increasing number of chemical industries that are locating in the vicinity of Buffalo, and taking their power from the Niagara River, is indicative of the development of such industries in this country, and show the wonderful growth in that direction that has occurred since the World's Fair, held in Chicago in 1893,

after which the foreign experts returned to their own countries to describe the great future in store for the United States. The application of electricity in the manufacture of white lead has resulted in a product which is obtained at a less cost and for which the claim is made that its properties are superior to those of the lead obtained by the conversion method. The process consists of volatilizing the lead in an electric furnace and then subjecting the vapor to the action of air and steam, carbon dioxide, and acetic acid. Active work continues in the production of artificial silk, and Chardonnet's process is now employed commercially. The preparation of the cellulose products of Cross and Bevan is carried on in England and Germany, yielding the products known as viscose and viscid, which are used for the sizing of paper and tissues with good results. Fuller details on the progress of industrial chemistry are to be found in George Lunge's *Impending Changes in the General Development of Industry, and particularly in the Alkali Industries*, *Journal of the Society of Chemical Industry*, for October, 1899; and in William McMurtrie's *Some Records of Progress in Applied Chemistry*, *Journal of the American Chemical Society*, December, 1899.

Physiological Chemistry.—In physiological chemistry the remarkable statement was published toward the close of the year that at Woods Hole the unfertilized eggs of the sea urchin, when subjected to a solution containing certain sodium and magnesium salts, became fecundated thereby, hatching the first larvæ thereafter. Further experiments seemed to show that only the presence of calcium and potassium salts in sea water prevented the development of all unfertilized eggs, and that all the milt deposited by the male needed to do was to overcome the effect of these chemicals. This may be a step in the progress which chemists are daily making toward the breaking down of the barrier which exists between that which is life and that which is not life. Also of special value has been the continued work by Buchner on the important question as to whether alcoholic fermentation could be obtained without cells. This was controverted by Abeles, but later experiments by Buchner sustained his original investigations. Among the more distinguished chemists who have passed away during the year may be mentioned Robert Wilhelm Bunsen, Hamilton Young Castner, Sir Edward Frankland, Auguste Scheurer-Kestner, and Ferdinand Tiemann.

CHENNEVIERES, Marquis CHARLES PHILIPPE DE, director of the *Académie des Beaux-Arts*, was born July 23, 1820; died April 2, 1899. He was a member of the Institute of France and was chairman of the board of administration of the Paris Exposition of 1878.

CHERBULIEZ, VICTOR, romancer, and member of the French Academy, was the son of André Cherbuliez, a professor of Latin in Geneva, and was born in that city July 19, 1829. He died July 1, 1899. In Geneva, Paris, Bonn, and Berlin he studied first mathematics and then philology and philosophy, being greatly influenced in the German universities by the writings of Hegel. He taught in his native city until 1864, when he accepted an editorial position on the Paris *Revue des Deux Mondes*. In this periodical appeared, with one or two exceptions, all of his works, comprising now about thirty volumes, of which twenty-four are novels. The appearance of *Un Cheval de Phidias* in 1861 marked the beginning of his literary career. He was then a man of mature years and of deep scholarship and wide reading in continental literature, whose mind had been further enriched by travels in Greece, Russia, and the East. Cherbuliez never became a popular writer in the sense that Zola and Daudet became popular, but to those to whom he appealed at all he appealed strongly. Though his plots are interesting and dramatic, it is other characteristics that have especially endeared his works to his admirers. These characteristics were a delicate humor, a rich imagination, a deep intellectual and philosophical culture, and a style that was pure, classic, and brilliant. "‘L'esprit’ is truly the most general characteristic of the work and talent of Cherbuliez. It is a delicate, subtle, and fine irony which plays across every page, and is, above all, discernible in the dialogue of his heroes, in the author's reflections, and even in his style." "Though a skeptic in metaphysics, the philosophy which exhales from his works is neither frivolous nor immoral. He believed in toil, in justice, in goodness. His raillery was reserved for two kinds of men—knaves and fools. He preached incessantly resignation, sacrifice, mutual respect, and toleration." Over the pen name of Valbert he published monthly after 1875 essays on politics and a variety of other subjects. In 1881 he became a member of the French Academy. His works include: *Le Comte Kostia*, 1863; *Le Prince Vitale*, 1864; *Paule Méré*, 1865; *Le Roman d'une Honnête Femme*, 1866; *Le Grand Œuvre*, 1867; *Prosper Randoce*, 1868; *L'Aventure de Ladislav Bolski*, 1868; *L'Allemagne Politique*, 1870; *La Revanche de Joseph Noirel*, 1872; *Meta Holdenis*, 1873; *L'Espagne Politique*, 1874; *Miss Revel*, 1875; *Le Fiancé de Mlle. Saint-Maur*, 1876; *Samuel Brohl et Comp.*, 1877; *Hommes et Choses d'Allemagne*, 1877; *L'Idée de Jean Téterol*, 1878; *Amours Fragiles*, 1880; *Noirs et Rouges*,

1881; *La Ferme du Choquard*, 1883; *Hommes et Choses du Temps Présent*, 1883; *Olivier Maugant*, 1885; *La Bête*, 1887; *La Vocation du Comte Ghislain*, 1888; *Une Gageure*, 1890. His last novel is *Jacquinc Vance*.

CHESS. The year 1899 was a notable one for American chess. Pillsbury and Marshall won honors for the United States abroad, while the fourth annual international cable match was won from Great Britain by the Americans for the second time in the series, the Americans now holding the Newnes trophy. The year saw, also, the first international intercollegiate cable match. In this country there was a continuation of telegraphic and correspondence matches. There was organized in 1899 the Chess Association of the United States, and also many new State associations. The national organization established headquarters at 105 East Twenty-second Street, New York City, with the following officers: President, Judge Lesser, of Boston; secretary, George H. Walcott, of Boston; treasurer, W. P. Shipley, of Philadelphia. The marked growth in intercollegiate interest in the game was shown during 1899 in the newly established cable match, instituted by the Intercollegiate Chess Association, composed of Harvard, Yale, Princeton, and Columbia. In addition, the intercollegiate association was supplemented in 1899 by a second organization, known as the Tri-collegiate Chess Association, whose members are the universities of Pennsylvania, Cornell, and Brown. This association held its first meeting December 27-30. It was proposed by the latter body that the winners in the two respective tournaments next year meet one another in a third tournament. It was suggested, also, that the Tri-collegiate Association be allowed representation in the next intercollegiate cable match with the English universities. Early in the year the Polish champion Janowski visited New York, where he played with much success. Abroad occurred the great international tournament at London, the Russian national tournament at Moscow, and the international tournament at Amsterdam. Important records of the year follow: International tournament, May 30 to July 10, London, 16 entries: won by E. Losker, 22 out of 27; tied for second place, with 18 out of 27, H. N. Pillsbury, American champion, D. Janowski, Polish champion, and G. Maroczy, the three dividing the second, third, and fourth prizes. Minor London tourney, May 30 to June 15, 12 entries: won by F. J. Marshall, Brooklyn, N. Y. City. Fourth annual cable match, America vs. Great Britain, March 10-11: won by America, 6 games to 4, the American players being Pillsbury, Showalter, Barry, Hodges, Hymes, Voigt, Johnston, Marshall, Newman, and Baird. First international intercollegiate cable match, Intercollegiate Association vs. Cambridge and Oxford, April 21, 6 players a side: won by English universities, $3\frac{1}{2}$ to $2\frac{1}{2}$, trophy being a shield, valued at \$100, presented by Professor Isaac L. Rice. Seventh annual intercollegiate tournament, Columbia, Harvard, Yale, and Princeton, December 26-30: won by Harvard, 10 victories, for fifth consecutive time, Columbia having won the first two tournaments of the series; second, Columbia, $8\frac{1}{2}$; third, Princeton, 3; fourth, Yale, $2\frac{1}{2}$. First annual tri-collegiate tournament, Pennsylvania, Cornell, Brown, December 27-30: won by Pennsylvania, 6; second, Cornell, $5\frac{1}{2}$; third, Brown, $1\frac{1}{2}$. The Moscow tournament was won by M. I. Tschigorin; at Amsterdam, H. E. Atkins, England, took first prize. The champion Janowski played two matches at New York with the American player Showalter, winning the first, 7 to 2, with 4 draws, and losing the second, 4 to 8, with 1 draw; he defeated Marshall, 3 to 1, and in a match against 15 New York experts he won 14 out of 15 games, and 1 drawn. The State associations held their annual tournaments on Washington's Birthday, which is the great day for chess in this country. The States were New York, Pennsylvania, New Jersey, Rhode Island, Ohio, Mississippi, Virginia, and others. New York also held a summer meeting at Saratoga, and later won the third New York-Pennsylvania match. New York City (Brooklyn) beat Chicago in a correspondence match, Chicago beat Boston in a telegraphic match, and New York (Manhattan) beat Philadelphia in a match held at the latter city; the Vienna chess club beat the St. Petersburg club in a two-game match by $1\frac{1}{2}$ to $\frac{1}{2}$, the most notable European club match. A correspondence match between the United States and Canada was arranged for in 1899.

CHICAGO DRAINAGE CANAL. See CANALS; SEWAGE PURIFICATION.

CHICAGO, ELECTION IN. See HARRISON, CARTER HENRY.

CHICAGO, UNIVERSITY OF, situated between Washington and Jackson Parks, Chicago, was founded in 1890 by John D. Rockefeller, and opened October 1, 1892. In 1899 there were 210 instructors, 2959 students, endowment of \$5,477,857, productive funds amounting to \$4,095,940, and a library containing 295,000 volumes. President, William Rainey Harper, Ph.D., D.D., LL.D. For other statistics see UNIVERSITIES AND COLLEGES; see also PSYCHOLOGY, EXPERIMENTAL.

CHICKERING, GEORGE HARVEY, who died November 19, 1899, was the last male survivor of the family that became celebrated on account of the pianoforte instru-

ments which bore their name. The late Jonas Chickering, the founder of the present Chickering pianoforte works, died in 1853, leaving three sons—C. Frank, Colonel Thomas E., and George H.—to succeed to the business. The two older sons died some years ago. George H. was born in Boston. When engaged in his business, with which he had not for some years been actively connected, he employed himself largely in its practical exercise in the shop. He was at one time the moving spirit in a musical organization known as the Chickering Club, in Boston, which flourished before the days of the Apollo Club. Of this he was president for a long time, and was more or less identified for years with its executive boards. Recently he had lived quietly at his home in Milton, Mass., where he gave much time to the study of amateur photography, along the line of which his work is said to have been remarkable.

CHILDREN'S AID SOCIETY, organized 1853, for educating and finding homes for poor children, reports in 1899 a daily average attendance in the industrial and evening schools of 7208, and a total enrolment of 15,773. The society conducts among their 22 different schools, situated in various parts of New York City, a school for crippled children (opened 1899), and has 4 lodging-houses for boys and girls, and various health homes, summer homes, etc., in the country. President, D. Willis James; secretary Charles Loring Brace, United Charities Building, New York City.

CHILE, a republic of South America, extends between the Andes and the Pacific Ocean from Peru to Cape Horn. The capital is Santiago.

Area and Population.—Chile is divided into 23 provinces and one territory, the total area of which is 290,829 square miles. According to the census of 1895, the population, exclusive of about 50,000 Indians, was 2,712,145; it is likely, however, that the actual number is nearly 3,300,000. The territory Magallanes, embracing the most southern part of the country, has an area of 75,292 square miles, and had in 1895 a population of only 5170. The largest province is Antofagasta, formerly Bolivian territory; area, 72,204 square miles; population, 44,085; the smallest province is Valparaíso; area, 1659; population, 220,756. (For the demarcation of Atacama, determined by arbitration in 1899, see ARGENTINA.) The dispute concerning the Andean boundary line, farther to the south, and submitted to the arbitration of the government of Queen Victoria, has not yet been decided. In 1895 the urban population was reported to be 1,240,353, and the rural, 1,471,792. At the beginning of 1898 estimated urban populations were as follows: Santiago, 302,131; Concepcion, 49,607; Talca, 39,613; Valparaíso, 139,038. On August 8, 1899, a tidal wave swept into the last-named city, causing damage to the amount of over \$1,000,000. Immigration to Chile is small, exceedingly small in comparison with that of the transandean republic of Argentina; to further immigration a provision of 616,890 pesos was made in 1898. The number of foreigners in Chile is less than 100,000.

Government.—The constitution adopted in 1833 established three departments of government—executive, legislative, and judicial. Executive authority devolves upon a president, chosen by an electoral college, who is assisted by a council of state and a responsible ministry, the members of the latter having charge of the following departments: the interior, foreign affairs, finance, justice and public instruction, war and marine, industry and public works, worship and colonization. The council of state consists of eleven members, five named by the president and six by the congress. The president is Señor Don Federico Errázuriz, who was elected June 25, 1896. The non-federal executive authorities are intendents, presiding over the provinces, and governors presiding over the departments.

A congress, consisting of a senate and a chamber of deputies, holds the legislative power. Senators are chosen for six years by the provinces, and deputies for three years by the departments (subdivisions of provinces); the number of the senators is one-third that of the deputies, and each deputy represents 30,000 inhabitants or a fraction thereof, not less than 15,000. A deputy must have a yearly income of nearly \$490, and senators nearly \$1950. Legislation in Chile is said to be attended with difficulty. The congress consists of representatives of half a dozen different parties, who do not readily reach a majority vote upon anything, except the overthrow of the ministry. This state of affairs, together with alleged conditions of corruption and wire-pulling, is proving deleterious to good government. Legal voters are at least twenty-one years of age and are able to read and write; this class constitutes about one-eighteenth of the population. Justice is dispensed through subordinate courts in the districts, through courts of first instance in the capitals of departments, and through six courts of appeal and the High Court of Justice in Santiago.

Army and Navy.—The regular army, the officers of which number 623, must not number more than 9000 men. There are ten regiments of infantry, eight of cavalry, five of artillery, and a corps of engineers. The national militia, reorganized in 1896, is divided into three parts—active, passive, and sedentary—and is composed of

citizens from twenty to forty years of age. A citizen renders active service in the national guard during his twenty-first year. During 1898 the men enrolled in the three departments numbered 16,309 active; 7,301 passive; 5,672 sedentary; total, 29,282. The total enrolment of 1896, 1897, and 1898 was 512,700.

The navy consists of five armored vessels, two second-class and three third-class cruisers, fifteen first-class and four second-class torpedo boats, four destroyers, and eleven gunboats. Among the more important vessels are: *Almirante Cochrane*, ironclad, launched at Hull in 1874, displacement 3500 tons, indicated horse-power 2920, nominal speed 13 knots; *Capitan Pratt*, battleship, launched at Le Seyne in 1890, displacement 6900, indicated horse-power 12,000, nominal speed 18.3; *O'Higgins*, armored cruiser, built at Elswick in 1896, displacement 8500, indicated horse-power 16,500, nominal speed 21.2; *Esmeralda*, first-class cruiser, launched in 1896, displacement 7020, indicated horse-power 18,000, nominal speed 23.

Finance.—The chief sources of revenue are export and import customs and accretments from the railways; the largest expenditures are for the national debt, and for public works and salaries. For 1897 the revenue in pesos was 85,439,021; expenditure, 84,614,284. For 1898 the revenue and expenditure was estimated at 76,250,000 and 76,205,164 respectively, but subsequently the estimate for the latter was 79,931,452. The estimates in pesos for 1899 were: Revenue, 93,844,799; expenditure, 80,793,805.

According to the *Bulletin* of the Bureau of American Republics, the following official estimates of revenue and expenditure, subject to revision, were made in the fall of 1899: Estimated revenue and expenditure for 1899, 114,964,434 pesos and 104,576,193 pesos respectively; estimated revenue and expenditure for 1900, 109,749,949 pesos and 104,263,578 pesos respectively. Although the budget for 1899 showed a surplus of some 10,000,000 pesos, the finance minister, in view of extraordinary expenditures which must be incurred on account of recent damages to railways, bridges, and roads by floods, deemed it imprudent to fix the available surplus at more than 4,000,000 pesos.

Chile was on a gold basis from 1896 to July 30, 1898, when a law was passed providing for an issue of 50,000,000 paper pesos. As the law now stands the conversion of these notes will begin on January 1, 1902. The value of the peso in United States currency is \$0.365.

Industries.—The leading industries are agriculture, in which 1,500,000 of the population are engaged, stock-raising, and mining. The country is reported to have an annual production of about 28,500,000 bushels of wheat, and 8,500,000 bushels of other cereals, while over 500,000 cattle and 2,000,000 sheep, goats, etc., are reared each year.

Besides the workings of nitrate, borax, and guano, there are more than 7000 registered mining claims; the chief minerals found are nitrate, copper, silver, gold, coal, and manganese. The fields of nitrate, the output of which seemed to be increasing in 1898 and 1899, cover an estimated area of 220,350 acres; the output in tons for the years 1896, 1897, and 1898 was reported as 1,092,000, 1,064,075, and 1,254,000 respectively. At one time Chile produced about one-third of the copper output of the world; but the discovery of the metal in other countries, together with the low quality of Chilean ores and the primitive methods of mining, caused a decline in production. The recent appreciation of copper has brought about a renewed interest in the industry. Large quantities of coal are produced, but it is inferred that the industry is not in an excellent condition, as in the summer of 1899 the government advertised for Australian bids for supplying 40,000 tons for the railways, about one-third the amount needed.

Manufacturing has not attained a place of importance, though in Valparaiso there are sugar refineries, gas-works, carriage-works, breweries, saw-mills, shoe factories, and works for machine-making.

Commerce.—The total imports and exports in 1897 were 65,502,805 pesos and 64,754,133 pesos respectively; of the former about 75 per cent. and of the exports about 61 per cent. were subject to duty. Among the leading imports, valued in pesos, for that year were: Sugar, 5,989,659; coal, 4,122,918; cottons, 3,937,096; cattle, 2,756,600; sacks, 2,440,209; illuminating oil, 1,458,090. The leading exports included: Nitrate, 37,461,559 pesos; copper (in various forms), 5,647,924; silver (bar, ingot, and ore), 4,215,356; wheat, 2,599,640; iodine, 2,629,370; coal, 1,869,310; shoe-leather, 1,344,005. Of the exports in 1898 over 75 per cent. represented mining products; agricultural exports were less than 8 per cent. On the 1st of January, 1898, when an increased tariff law went into effect, there began a falling off in the import trade at Valparaiso. The largest part of the foreign trade is with Great Britain and Germany, the former being far in the lead.

According to a report of the Chilean legation in Washington, as published in the *Bulletin* of the Bureau of American Republics for December, statistics of the nitrate industry up to the end of October, 1899, are as follows: Total production, 1,138,626

tons; total exports, 1,064,044 tons; of this export there were sent to Europe 917,503 tons, to the United States 125,665 tons, and to other countries 20,876 tons. In 1899 the wheat crop suffered from unfavorable weather. The estimated amount available for shipment to Europe was about 40,000 tons; the export to Europe in 1898 was 76,964,606 kilograms (about 84,600 tons); the barley export in 1898 was 16,405,528 kilograms.

Shipping and Communications.—The merchant marine comprised on the 1st of January, 1897, 160 vessels aggregating 80,270 tons; of these 48 were steamers of 25,521 tons net. In the foreign trade there entered the Chilean ports in 1896, 2193 vessels, tonnage 3,315,426, and cleared 2346, tonnage 3,961,996. The total tonnage of coasting vessels entering in 1896 was 6,656,603. Besides English and Chilean steamship lines to Peru and Panama, there are English, German, and French lines to European ports; in 1899 a company was formed for establishing a line between Chilean and Spanish ports.

The total length of railways open for traffic in 1897 was 2661 miles; of these 1233 miles were owned by the state and cost 82,269,660 pesos. Concerning the Transandean Railway, which for some time has been in process of construction and which will connect Valparaiso with Buenos Ayres by way of Mendoza, it was reported in the fall of 1899 that, contrary to former plans, it will not touch at Uspallata, on account of the great expense involved, but will probably cross the Andes a little south of the 34th parallel and of Maipo Mountain. The highest point thus attained would be 7546 feet above sea-level. When the road is completed the journey from Santiago to Buenos Ayres will not take, it is said, more than forty hours.

Religion and Education.—Toleration prevails for all religious faiths, but the state religion is Roman Catholic. In 1898 ecclesiastical subsidies amounted to 578,888 pesos. Education, which is free but not compulsory, is classified as primary, secondary, and professional. In 1898 the public primary schools reported numbered 1368, and the total enrolment was 99,831; in addition there were 396 private schools with 15,785 pupils in attendance. For secondary and professional education there are various lyceums and colleges, and the National University and the National Institute at Santiago. In 1897 the student enrolment at the Institute was 1278, and at the university 774. Besides the public and private schools there are at the seats of the bishops seminaries under church control; the instruction given is similar to that of the government schools. In 1897 the total state expenditure for instruction was 5,633,021 pesos. The national library at Santiago comprises more than 86,000 volumes and 24,000 manuscripts.

CHINA CLAY. See KAOLIN.

CHINESE EMPIRE comprises China proper and the dependencies of Manchuria, Mongolia, Tibet, Jungaria, and Eastern Turkistan. China proper has an area of about 1,336,841 square miles, with a population of about 386,000,000. Including the dependencies, the area is about 4,218,401 square miles, and the population 402,680,000, though some estimates place the latter as high as 430,000,000. The Europeans number about 10,000, of whom 4000 are British, and more than half of them are centred at Shanghai.

Production.—Agriculture is the chief occupation, and in general the land is divided into small holdings. In the south the chief product, as well as the chief article of food, is rice, but sugar, indigo, and cotton are also cultivated. In the north the chief products are wheat, maize, and millet. The soil is very fertile, especially in the valleys of the large rivers. Labor is cheap and abundant, and in spite of the primitive methods of cultivation the yield of the land is large. Two or three crops of cereals are commonly raised in a single year in the fertile valleys, and three and sometimes four crops of vegetables. It is estimated that an eighth of the cultivated surface of China is taken up with rice, the average annual crop being about 500,000,000 hectolitres. Next in importance is tea, which is cultivated especially in the region between the Yellow River and the Yang-tse, the annual crop being about 400,000,000 kilograms. Tea is cultivated especially in the southern and western provinces. Silk cultivation is also an important industry. The mulberry-tree grows in all parts of the country, but silk-raising achieves its best results in the province of Keang-su, Sze-chuen, Che-keang, and Kwang-tung. According to some estimates, the number of silkworms raised in China is nearly two-fifths of the total world's production. In China proper not much attention is paid to cattle-raising, milk products not being common articles of food. The common domestic animals of the Chinese are pigs and poultry. The country is not as a rule well wooded, though the mountains and hill-sides have considerable timber, and in some parts of the country the forest products are exploited. The mineral resources of the country are very great, although but partially developed. They comprise silver, gold, copper, mercury, iron, zinc, lead, petroleum, various mineral salts, and, above all, abundant

coal measures, China being regarded by some as the chief coal country in the world. Coal, in fact, is found in all of the eighteen provinces, and the mines, which have been worked under foreign control, have been very productive. The development of the mineral resources, however, awaits foreign capital and enterprise. Important steps were taken in 1898 and 1899 in this direction, and some account of the concessions made by the government to foreigners will be given in a subsequent paragraph. The manufactures of China are not yet important, although there is a movement to develop a cotton industry at Shanghai, and a silk industry at Shanghai, Canton, and other cities. The cotton mills promise to become formidable competitors of the foreign cotton manufacturer on account of the low price of Chinese labor. At Tientsin there have also been established a number of flour-mills. Very crude implements are employed in the industries. "Labor-saving devices are not in demand in China," writes one of our consuls. "The cheapest thing here is a man." See COTTON AND COTTON INDUSTRY; SILK MANUFACTURING.

Foreign Trade.—Foreign commerce is confined to the treaty ports, of which there were 33 at the beginning of 1899. In the course of a year a new port, that of Yochow-fu, was opened on the Yang-tse River. Complete statistics for the foreign trade of China are not available. The only official source of information is the bulletin issued by the Chinese customs office, and this does not state the origin of the different classes of merchandise, but includes the products of European countries under the mere head of the continent of Europe. Exceptions to this rule, however, are England and Russia, whose trade is reported in separate publications. For the United States the Consular Reports are the chief authority. The following list shows the countries trading with China in the order of their respective shares of the trade: 1, England and her colonies; 2, Japan; 3, United States; 4, Russia; 5, Germany; 6, France and her colonies; 7, Belgium; 8, Austria; 9, Switzerland. The statistics of commerce by flag do not show the relative importance of the trade of the different countries, since the flag does not necessarily indicate the origin of the merchandise, but are important as indicating the distribution of the shipping. The following table, taken from the United States Consular Reports of September, 1899, shows the trade by flag in the year 1898:

Flag.	Number of Ships.	Total Values of Foreign and Coast Trade.	
		<i>Uk. tola.</i>	
British.....	22,600	508,241,936	\$352,719,906
German.....	1,831	52,185,211	86,216,536
Japanese.....	2,262	80,073,053	20,870,090
French.....	577	19,307,270	13,380,245
Swedish and Norwegian.....	408	11,019,821	8,064,156
Russian.....	118	6,142,666	4,263,010
American.....	743	4,327,530	3,003,306
Danish.....	268	2,735,275	1,896,281
Austrian.....	16	1,070,232	742,741
Korean.....	8	719,581	496,389
Dutch.....	18	635,212	440,837
Nontreaty powers.....	23	408,097	283,219
Italian.....	8,325	5,778
Spanish.....	2	2,061	1,430
Portuguese.....	141	561	389
Chinese.....	23,547	334,422,970	232,080,541

While the United States stands immediately after England and Japan in respect to the importance of its trade with China, it ranks very low on this list on account of the large body of goods which are carried in the ships of other countries, especially in those of England and Germany. The larger part of American petroleum, which is one of the chief imports from the United States, is brought to China in English vessels. Certain nations formerly represented in the colonial trade with China are no longer on the list, their goods being brought to China in the ships of other nations. Belgium, for example, has a larger commerce with China than Sweden and Norway, and yet has no share in the carrying trade. In respect to shipping Germany stands next to England, but the value of German cargoes by no means represents the trade in German goods, since the German flag covers large quantities of the merchandise of other countries. Statistics for the foreign trade during the calendar year 1898 are given in the United States consular reports for September, 1899. Despite a number of obstacles which might well have checked China's foreign trade in that year, the total volume of her foreign trade was valued at a higher figure than was ever before recorded. The interruption of the business caused by several sporadic revolts, by the floods of the Yellow River, by rumors of war, and by the insecure political

situation did not prevent the commercial expansion. The investment of foreign capital in China has steadily increased in recent years, and has greatly stimulated commercial activity. For a period of twelve years—that is, from 1886 to 1898—there has been an annual excess of imports over exports, amounting on an average to about 34,000,000 Haikwan taels. The official statistics, however, by no means represent the whole of China's foreign trade. There are no statistics for the junk traffic with Corea and the countries to the south, nor is there anything but a rough estimate for the large trade with Mongolia and Thibet. The following table shows the value of the trade by countries in 1898:

Country.	Imports.		Exports.		Total.	
	<i>Hk. taels.</i>		<i>Hk. taels.</i>		<i>Hk. taels.</i>	
United States	17,163,312	\$11,911,339	11,996,771	\$8,318,819	29,160,083	\$20,230,158
Great Britain	34,062,474	24,263,957	10,715,952	7,436,871	45,678,426	31,700,828
Continent of Europe, including all the Russias	11,151,890	7,739,405	43,727,321	30,346,760	54,879,201	38,086,165
Japan, excluding Formosa	22,581,812	15,071,778	15,168,148	10,520,092	37,749,960	26,198,472
Hong-kong	97,214,017	67,466,528	62,063,512	43,065,958	159,297,529	110,533,485
Formosa	4,794,251	3,328,210	924,629	641,692	5,718,880	3,968,902
India	10,135,546	13,220,069	1,324,125	918,948	20,459,671	14,190,012
All the rest of the world	11,742,055	8,148,986	13,106,690	9,006,048	24,848,745	17,245,029

The net value of the imports in 1898 was \$145,448,058, which exceeded that of any previous year, and was 6,750,709 Haikwan taels in excess of the value for 1897. It is estimated that the value of the imports between 1886 and 1898 increased 145 per cent. The exports in 1898 were valued at \$110,371,781, a slight decline as compared with the previous year, but an increase over the general averages of the years before 1897. This increase has taken place in spite of the falling off in the exportation of tea and silk, in both of which there were signs of decadence, although the decrease in the importation of tea was partly due to the new duty in the United States and the enforcement of a higher standard of purity. There has been a steady increase in the exportation of the following articles: Hemp, hides, leather, mats and matting, oils, tobacco, and feathers. In regard to the competition of foreign countries in the trade with China the following statements of recent writers may be of interest: One of the most striking features of recent commercial history is the rapid development of German trade. Germany has attained a strong position in the eastern trade, and in many places competes successfully with England. Thirty years before her commerce with China was of little importance, and her flag was rarely represented in Chinese waters. Now seven lines of steamers ply between Germany and China, and she ranks next to England in the importance of her shipping. In 1882 Germany had 56 business houses in China. In 1899 the number was reported at over 100, being centred especially at Shanghai and Tientsin. At all the principal Chinese ports German houses are represented. England, a short time ago, had nearly a monopoly of the sale of cotton goods in China, but latterly has encountered the active competition of the United States and Japan, the latter country having shown herself an especially powerful competitor, owing to the large amount of cheap and effective labor at her disposal. Japan, the United States, and Russia have nearly kept pace with Germany in the expansion of their Chinese trade. Japan has been especially successful in placing on the Chinese market its cottons, charcoal, and matches. Russian petroleum has found its way into China in quantities nearly equal to those sent by the United States. She imports from China, on the other hand, great quantities of tea, the centre of the Russian tea trade being Hankow. But, according to the reports of the British official who has charge of the collection of customs duties, American goods, especially cottons, have gained more rapidly than the imports from any other country, and the Chinese are taking increasing quantities of American machinery, oils, and food-stuffs.

Trade with the United States.—The trade of the United States with China has expanded greatly in recent years. The staple imports from the United States are kerosene and cotton goods. Between 1887 and 1897 the imports of cotton goods and yarns from the United States increased from 22.36 per cent. of the total to 33.04 per cent. of the total, Great Britain supplying almost all the rest. The greater part of the cotton goods come from New York by way of the Suez Canal. The market for this class of articles seems capable of indefinite extension, since the numerous population of China depend almost solely upon cotton as the material of their wearing apparel, and the opening of the interior to foreign commerce will greatly extend the effective demand. The importation of kerosene from the United States increased during the same period in even greater proportions. During ten years, in fact, it nearly tripled. It encounters the competition of Sumatra petroleum, but a more

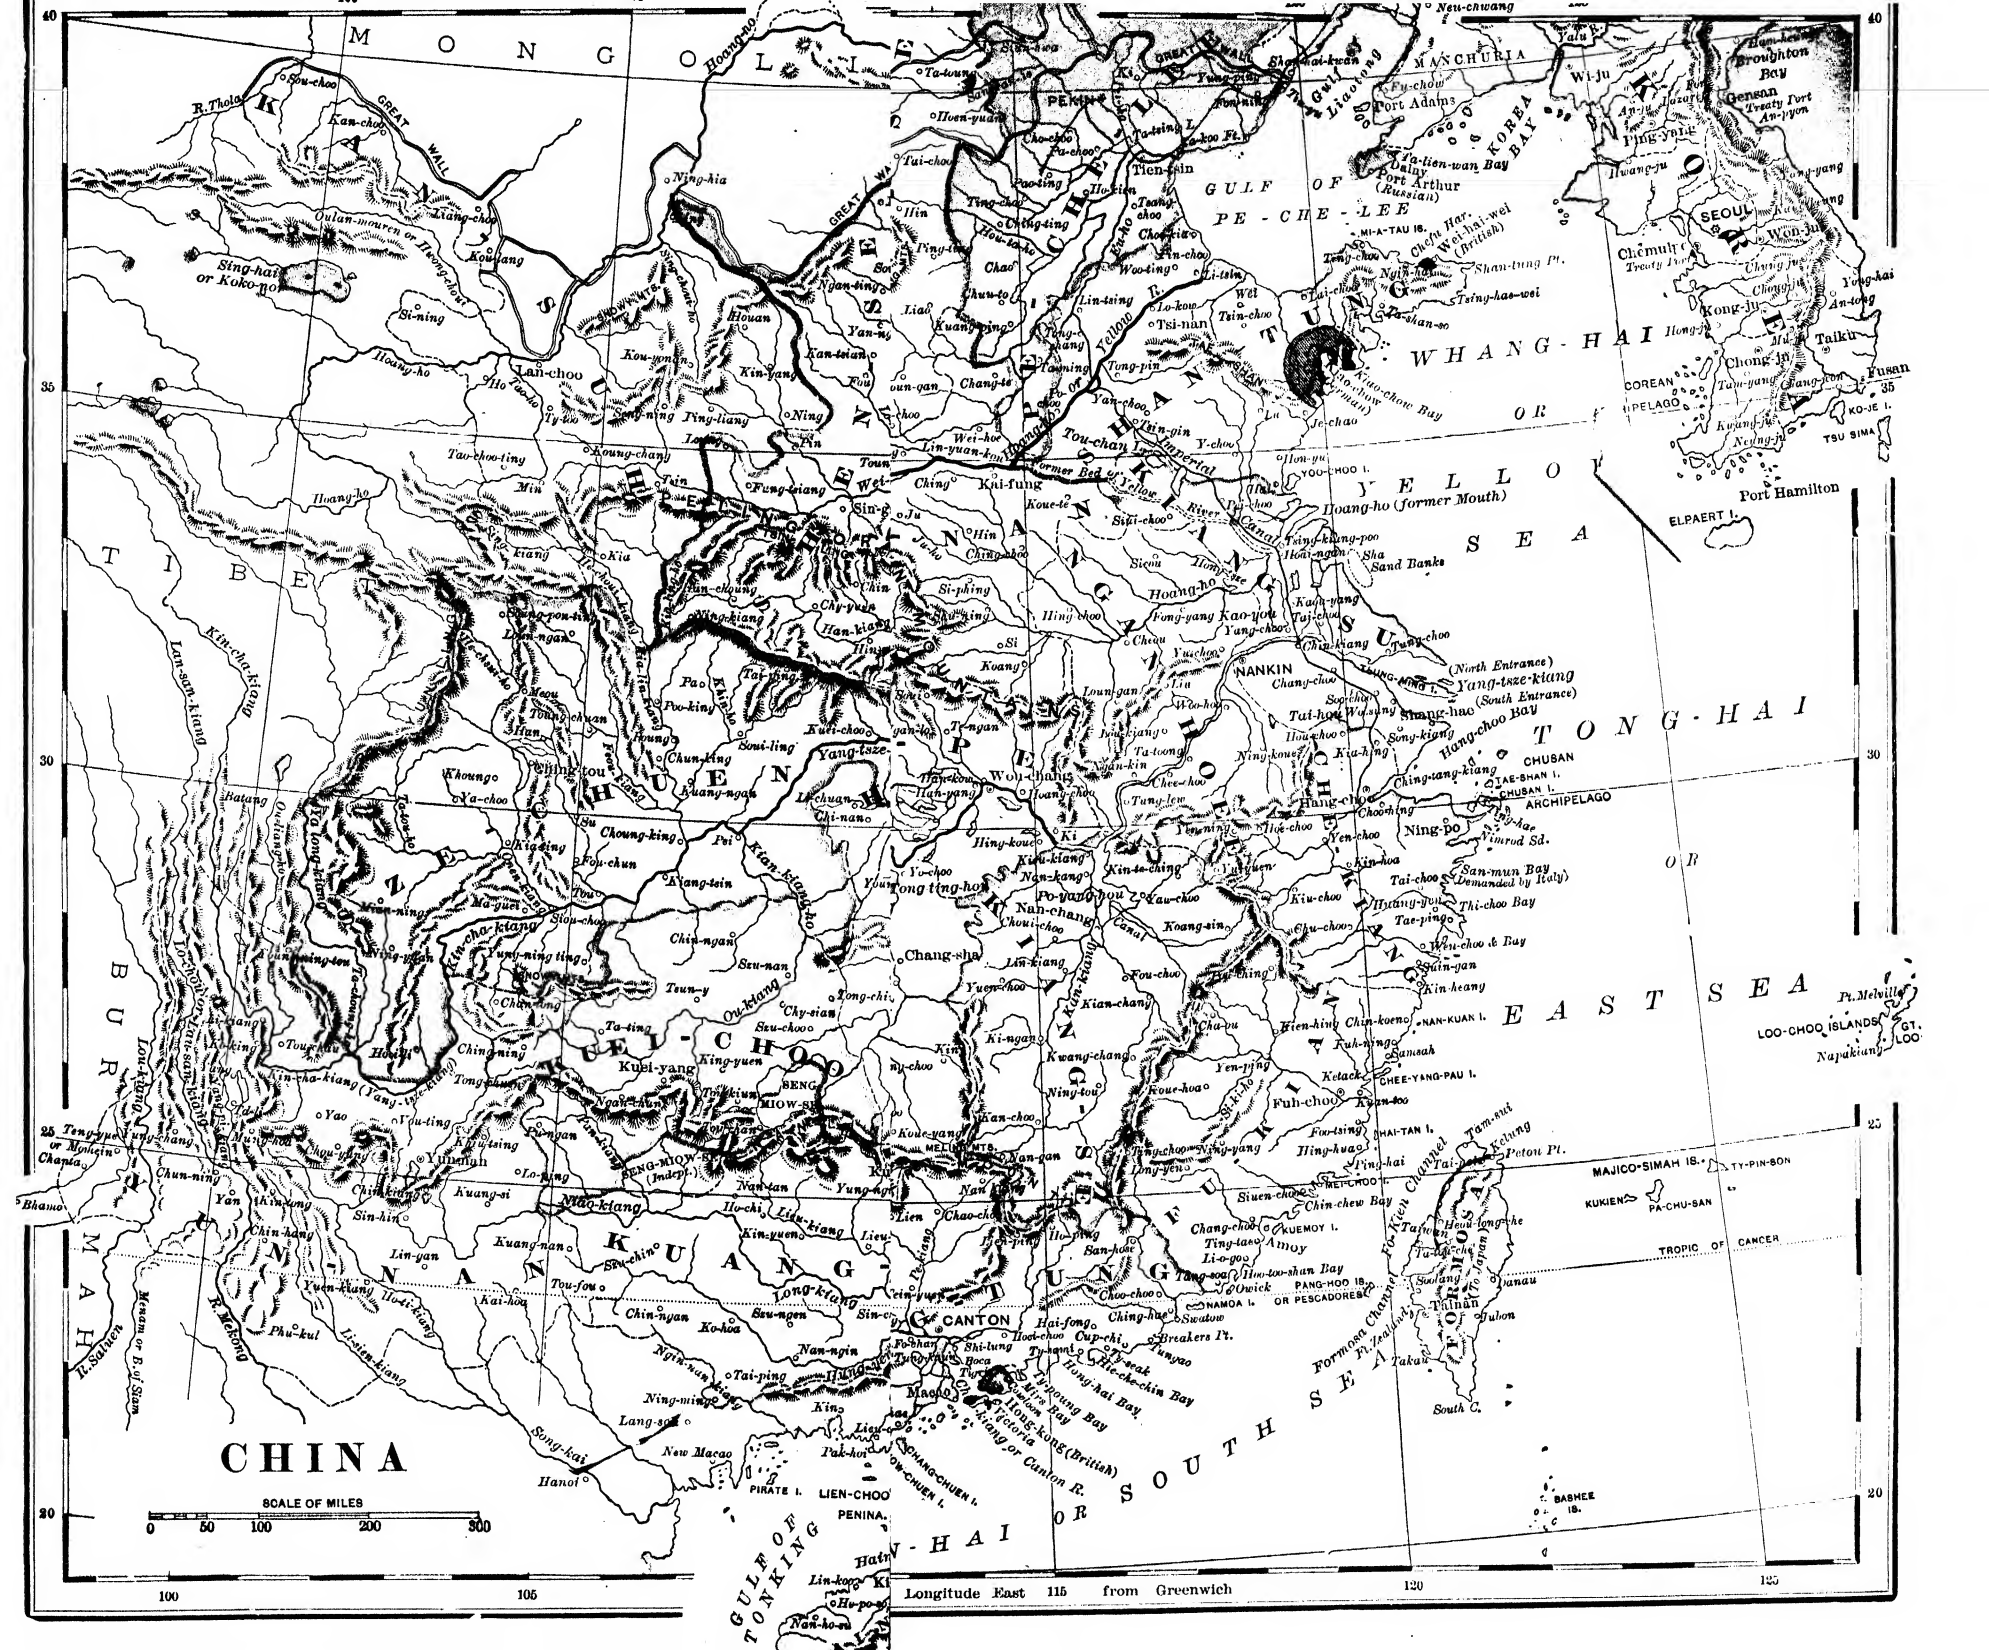

serious competitor is Russia, which has come to the front since 1891. In that year the Russian petroleum was hardly more than one-fourth of the American imports, but it exceeded the latter in 1895 by about 3,000,000 gallons. In 1897, however, the American petroleum exceeded the Russian by more than 7,000,000 gallons, being nearly 48,250,000 in that year. The greater part of the American kerosene comes from New York and Philadelphia by way of Suez Canal. Flour has occupied the third place in American importations and more than doubled in the period between 1887 and 1897. It is preferred by the Chinese to the imperfectly refined flour of their native mills, but the flour-mills recently established at Tientsin seem to indicate that in the course of time the Chinese may produce a better grade for themselves. In iron and steel and in some highly wrought articles, like machinery, watches, and clocks, the commerce of the United States has also been increasing. From China the staple exports to the United States are tea and silk. About one-half of the tea in 1897 came from China. The silk in 1897, most of which was raw silk, reached a figure of nearly \$5,000,000. One of the most significant features of the expansion of the American trade with China is the successful competition of American cotton goods with the products of Manchester. The favor with which American cotton goods have been received in China is attributed by some to their cheapness, but our consuls account for it rather by their superior quality. The defective method of setting forth the foreign trade of China makes it impossible to ascertain what the trade of the United States is really worth. A large part of it is credited to Great Britain because it is carried in British ships—for example, the shipments from Atlantic ports to China via England. The entire American trade with the ports of China south of Shanghai goes through Hong Kong, but the figures are credited to Great Britain. In regard to the imports from the United States, it is stated by our consular agents that we sell ever-increasing quantities of lumber, household stores, lamps, iron, etc., as well as the staple articles of trade already mentioned. For these commodities it is impossible to secure complete statistics, but it is estimated by our consuls that while Great Britain in 1895 sold five times what the United States did, she sold in 1898 only twice as much. It is further pointed out in connection with the trade of 1898 that while those powers that had taken parts of Chinese territory during that year suffered severe losses in trade, Japan and the United States were gainers. Yet while the trade of the United States with China has increased with remarkable rapidity, it still forms only a small fraction of the total, so far as it can be traced through the defective official statistics. In 1889 the imports from the United States to China were 2.2 per cent. of the total imports from all countries, and in 1898 they were 6.3 per cent. The figures for 1898 are given above. For the 1899 figures see UNITED STATES.

Efforts to Promote Trade.—There has been much discussion of late as to the best means of promoting trade with China. The slow progress of British trade in the Far East has been a matter of concern among the British capitalists, and the British China Association has taken the matter in hand, acting upon the suggestions offered by Lord Beresford after his return from his visit to China. The reasons assigned by the association for the slow development of the British trade in China were: First, the bad faith of the Chinese in the observance of the treaty obligations; second, the lack of security for foreign capital, excepting at the treaty ports; and, third, the general apathy and ignorance in the matter of trade with China. Many instances are cited of the evasiveness of the Chinese in the matter of their promises. It is pointed out that the seeming concession in respect to inland navigation has amounted to very little, since foreigners are still forbidden to reside for purposes of trade anywhere except at the treaty ports. Without the right of establishing stations in the interior and maintaining agents there to protect foreign goods, the opening of the inland waters to navigation cannot develop trade. There is, moreover, a danger that internal trade may be subjected to excessive taxation, and the vital question to the foreign capitalist is, can the central government protect the internal concessions and prevent their injury from the rapacity of provincial officials? The chief desire of the British and American shippers is for a strong central government, and it is the general opinion that internal trade will not develop rapidly until some measures of administrative and fiscal reform are adopted. The British China Association emphasizes the fact that nothing has ever been gained from the Chinese government except through pressure backed by threats. The American Association of China was formed at Shanghai on December 16, 1898, for the purpose of fostering United States trade with the Far East, of obtaining and distributing information, and of uniting in a common organization those who are interested in eastern commerce. Like the British shippers the chief cause of their alarm is the weakness of the central government and the fear that it will be unable to protect the foreign trader. Referring to the concessions which the government has made to foreign countries, the president of the American Association of China pointed out that the treaties promise equal privileges to all and that these claims are in contravention of treaty rights. At the same time China appears to be helpless in this matter of maintaining treaty obligations.

Need of Administrative Reforms.—The old story of the Chinese practice of granting concessions without the least intention of making them good was repeated in 1899. For example, the opening of the inland water-ways to European steamers was supposed to be a great step toward the development of internal trade. It was soon found, however, that the advantage of transit along the water-ways was confined to passengers. To the carrying of goods serious obstacles were presented by the provincial administration, which feared the loss of its privileges of inland taxation. All sorts of difficulties have been put in the way of river traffic, which is met by exactions on the part of the officials at every point. The chief obstacle to effective administration in China is the inadequacy of official salaries. It is said that many mandarins of high rank receive no more than £50 a year as a salary. Their allowances and emoluments may bring the amount to £250, but out of this they are obliged to maintain the dignity of their position, pay for their retinue and secretaries, and entertain guests in a manner befitting their rank. The expenses of the office in many instances are from ten to twenty times the amount of the legitimate salaries. It is understood that these expenses will be met by levying toll upon the money that passes through official hands. As a result peculation is recognized as absolutely necessary, and official honesty under such a system becomes impossible. This corruption is especially marked in the imperial administration, and is so ingrained in the system that it has seemed impossible to eradicate it. It was recently estimated that a certain Chinese official had made away with some fifteen million dollars in the course of his tenure of office, but the Peking authorities, knowing the extent of his opportunities, kept close watch on him, and in the end got their hands upon the money, so that he left his office no richer than when he assumed it. Recent writers have advocated the reorganization of the administration under foreign control, and have urged that this should begin with the provincial administration, which appears to be less corrupt than the imperial. Reorganization by means of natives is said to be impossible, owing to the negligence or indifference of the Peking authorities, and to the degree to which corruption has become entrenched. As things are now the moneys collected by the officials seldom find their way to their proper destination. It is impossible to maintain the army in a state of efficiency if this system of plunder continues in force.

The Opening up of China.—An account of the recent progress in the development of China has been given in the last issue of the YEAR BOOK. The events that have occurred since the treaty of Shimonoseki have amounted almost to an industrial revolution. Within the past four years the right to establish manufactures in the open ports has been granted to foreigners. In 1898 it was decreed that all the navigable rivers in thirteen out of the eighteen Chinese provinces were opened to steam navigation, but, as above stated, this measure did not realize the hopes that had been based on it. Since the war with Japan twelve new treaty ports have been opened. Another important change is the systematization of taxation in one of the largest and richest portions of the empire, through the transfer of the *likin* tax of the Yang-tse basin to the control of the imperial customs service, of which Sir Robert Hart is in charge. Considerable progress in railway building was made during the year 1899, but, before describing that progress in detail, the following statement of the present condition and extent of railways in China may be of interest.

Chinese Railways.—Statistics showing the railways constructed or in process of construction in the summer of 1899, together with an account of the various railway projects, are given in a statement by M. Pierre Leroy-Beaulieu, of which the following is a brief summary. The opposition which superstition and ignorance offered to any improvements in matters of industry or transportation prevented the progress in railway building until 1876. In that year a short line of about 11 miles was built by Europeans, connecting Shanghai with its deep water port, Woosung; but in the following year it was torn up by the Chinese authorities. Not long afterward, however, Li Hung Chang was prevailed upon to permit the construction of a short industrial railway between the coal mines of Kaiping and the nearest navigable river, the Petang, which line was afterward prolonged to Tien-tsin on one side and to Shanghai-Kwan on the other, and this line of about 174 miles was the only railway in China until 1896. After the war this line was prolonged to Peking, a distance of about 84 miles, but it was ill-managed, had very little rolling stock, and yielded but a small profit. There was an addition of 40 miles on the north of the Great Wall, and this brings the total number to 208 miles for the network of the Pechili, and to this 11 more miles were added in 1898 by the reconstruction of the road from Shanghai to Woosung. English and American engineers have directed the construction, and the mechanics on the road are still Europeans or Americans, but all the other employees are Chinese. This shows a marked contrast to the Japanese railways, where the employees are all natives, but it is thought that it will not be long before the Chinese replace the Europeans. The Peking-Tien-tsin line has met with great success, and is thought to mark the beginning of a period of progress in railway building. Since the treaty of

Shimonoseki the concessions to the Europeans comprise some 6210 miles of track in the empire, and upon some 2484 of these work has already been begun. In regard to the remainder M. Leroy-Beaulieu says that for some the funds have not been subscribed, and for others the contracts have hardly been signed. The rivalry of foreign powers in the attempt to secure concessions has repeatedly entangled the Chinese government in diplomatic difficulties.

A brief summary may be given of the various projects which comprise the 6210 miles above mentioned. The first concession was to the Russian government for the Manchurian railways known under the official title of the Railways of East China. These comprise 885 miles for that section of the Trans-Siberian Railway which lies in Chinese territory. The terminus of this line is at Vladivostok. A line of 497 miles connects this terminus with Port Arthur, and a short branch joins the Port Arthur section with the open port of New-Chwang. The Russian government has entire control of these lines, those of eastern China being wholly dependent upon the St. Petersburg ministry of railways and communication. The main importance of these lines is strategic, for the country is not populous and cannot compare with central China in wealth. Work on the Manchurian railways was begun in 1897, and is being actively carried on at the present time. Sections are in progress from Trans-Baikalia, from the Russian littoral province on the banks of the Soungari, from Port Arthur and New-Chwang and large numbers of engineers and many tons of steel rails have been obtained from France and America. A line from Shanhai-Kwan to New-Chwang will connect the Russian network with Peking and a branch of Sin-Minting will open connection nearly as far as Moukden. These connecting lines will comprise 258 miles, and exploitation will be under the control of the British and Chinese Corporation, at the head of which is the house of Jardine and Matheson and the Hong-Kong and Shanghai banking corporation.

Germany has secured from the Chinese government a concession for a network of lines on the other side of the Gulf of Pechili. The German project promises well, for this region is one of the richest and most densely populated of China, having about 572 inhabitants per square mile. The lines to be constructed by the Germans will comprise 621 miles altogether, and form a triangle surrounding the mountainous region in the centre, extending from Kiao-Chau by way of Tsinan to the Yellow River and draining the traffic of the three provinces of Shensi, Shansi, and Honan. Another important line is that proposed to connect Peking with Hankow. It is noteworthy as the first railway project permitted by the Chinese government. It was started first in 1880 by a celebrated Chinese official, but, though progressive in his ideas, he distrusted foreigners and insisted on relying solely on Chinese capital and labor for the enterprise. The project was abandoned until it was taken up by a Franco-Belgian syndicate, which asked for the concession in 1898, but was thwarted for the time being by the diplomatic opposition of foreign powers. The concession was finally made, and in April, 1899, the formal grant was signed. The prospects of this line are most promising. At one end of it is the Chinese capital and at the other the dense mass of population gathered in and about the three cities of Hankow, Wuchang, and Hanyang. Hankow itself is regarded by some as the chief commercial city of the empire, and has been called the very heart of China, for, while it lies about 630 miles from the mouth of the Yang-tse-Kiang, vessels of the heaviest draught can reach it without difficulty. Work on the line has already been begun, and 50 miles have been constructed from Peking. In the summer of 1899 it was expected that it would be completed in 1903 or 1904. Another great project is that of a line, comprising over 600 miles, from Tien-tsin to Tching-Kiang on the Yang-tse, which has been entrusted to a group of Anglo-German capitalists. It also traverses a fertile and populous portion of the empire. The construction will be under the direction of English and German engineers. Among the minor projects are a branch of 186 miles to connect the Peking-Hankow line with Tai-Yuen-Fu, the capital of Shansi. The Russo-Chinese bank holds the concession, and work will be begun as soon as the Peking-Hankow line reaches Ching-Ting, from which point the new branch line will start. A prolongation to the southwest toward Singan-Fu is expected. In the rich Yang-tse Valley the British-Chinese Corporation has obtained concessions for the construction of two lines starting from Shanghai, the one extending toward the northwest and the other toward the southwest. In southern China there have been far fewer concessions of railways than in the north, for the contour of the surface is unfavorable, and the only important line yet conceded in this region is that from Canton to Hankow, comprising 600 miles. From the French colony the lines entering southwestern China are that from Laokai to Yunnan-Sen, 248 miles, that from the neighborhood of Langson to Long-Chau, about 22 miles, and that from Nanning-Fu to Pakhoy, 155 miles. Great difficulties attend the construction of these lines and they are likely to be less productive than those in the north. Further information in regard to railway concessions is supplied by the statistical bureau of the United States treasury in its bulletin on the commerce of China. South of the

Yang-tse the American and British lines are the only ones that have received concessions, with the exception of comparatively short concessions to French lines in the territory adjacent to the French dependency of Tonquin in the extreme south. A British line is planned to connect the treaty ports of Wen-chow, Ning-po, and Hang-chow with Shanghai, and to run north and south at a short distance from the coast, with the ultimate design of reaching treaty ports farther along the coast and terminating in the vicinity of Hong-Kong, with which it will be connected by a short British line now in process of construction. American interests are chiefly concerned in a single but important line to connect Canton with Hankow and to pass through a rich and very populous agricultural section, tapping an important iron and coal region at its centre. It is expected to connect with the proposed Belgian line at Hankow, and thus come into direct communication with Peking. It will also extend to the Yang-tse at a point several hundred miles from its mouth, and afford the products of the upper valley access to the coast. The concession was granted in April, 1898. The French lines are planned for the purpose of connecting the cities and navigable rivers of Tonquin with the trading centres of southern China, as well as with the navigable waters of the West River, which afford communication with the port of Canton. An important line lying to the west of the proposed American line is projected for the purpose of connecting the province of Su-chuan with Canton and Hong-Kong. It is under British control. If carried out it will afford communication between the capital of Su-chuan, which is one of the largest, most populous, and most productive of the Chinese provinces, with the important port of Woohow on the West River. Another proposed British line will connect China with the railway system of British India. This project calls for the extension of the existing railway line from Mandalay in Burmah to the Chinese border at Kun-Long. Thence an extension is proposed in a northeasterly direction to the city of Yu-nan and thence to Chun-king in the province of Su-chuan, thus coming out at the head of navigation on the Yang-tse. Since it would cross the line between Canton and Su-chuan it would complete communication between the British Indian possessions and the commercial centres of China, and bring the vast railway system of India, with its length of 25,000 miles, into communication with the Chinese and Trans-Siberian systems. Until now the lines have been built under the control and at the expense of the Chinese government, but the recent concessions throw the work open to the capital of foreign residents. In general the funds are to be raised by a mortgage, and the lines are to remain in the control of the foreign lenders until the mortgage lien is paid, after which they become the property of the Chinese government. Foreigners have not yet usually succeeded in obtaining a stock interest in addition to the mortgage liens, but the loans usually run for so long a time that the foreign lenders will practically own the roads. In the case of the American contract it will be possible for the capitalists to a certain extent to share in the profits. The Chinese government has shown its intention to obtain the final and complete control of the railways, and has stipulated in making these concessions that a certain proportion of the employees of the road shall be natives and that schools of instruction for Chinese in the construction and management of railways shall be established. Regulations for railways and mines have expressly required that every endeavor shall be made to have the proportion of Chinese capital greater than that of foreign capital, and to insure the ownership of at least three-tenths of the shares by Chinese. They further provide that no concession shall be granted in cases where all the money is foreign, and that the Chinese government shall receive four-tenths of the profits of railways and 25 per cent. of mines.

Mining Concession.—An Anglo-American company obtained in 1899 an important concession for the development of mines and oil-fields in the rich and populous province of Sze-Chuen. At the head of the enterprise was Mr. Pritchard Morgan, an English merchant. The regulations under which the enterprise was organized provided that the work should be done conjointly by Chinese and foreigners, and that the profits should be divided proportionately. It permitted foreigners to hold 50 per cent of the shares, but declared that there should be no monopoly for any one country. These regulations further stated that no company composed of foreign shareholders only should be allowed to work any of the mines. The attitude of the government toward foreign exploitation is illustrated by the following quotation from these regulations: "The area of Sze-Chuen is very extensive and all sorts of mines exist. Chinese who work on their own property are only required to obtain the necessary permission, and pay the necessary taxes, according to the rules in force, and they are in no way restrained. But if foreign merchants undertake to work the mines their operations must be limited in some way or other. They must confine themselves to certain intendants, prefectures, or districts, and not take the whole province as their sphere of work." Another provision is that the "mining bureau is to act as intermediary between the superiors and subordinates, and is to attend to all negotiations between natives and foreigners, and matters of protection."

The Yang-tse Region.—It will be remembered that the Chinese government recognized certain claims of the British affecting the Yang-tse region. The concessions of the Chinese government have been differently interpreted, but are held in general to mean that British interests in that region shall be safeguarded. It cannot be said that the Yang-tse region has actually become a British sphere of influence as that term is ordinarily used. Last year the tendency was toward the sphere of influence status, but that status is not yet firmly established. When the Pekin government granted to a Belgian syndicate, under the pressure of Russo-French diplomacy, the right to build a trunk railway in the Yang-tse Valley, a protest was made on behalf of Great Britain, but this protest was not sustained. The first real acknowledgment of an industrial sphere of influence is to be found in Germany's opposition to the concession to an Anglo-American syndicate of the right to build a railway across Shantung, since this opposition led to a compromise whereby England controlled the section of the road in Kiang-Su, while Germany controlled that which passed through Shantung. The Pekin government provided that no portion of the Yang-tse region should be mortgaged, leased, or ceded to any other power than Great Britain, but this came too late to prevent the concessions to Russia and France at Hankow in 1896. The Yang-tse region has been defined as the districts through which streams flow into the Yang-tse, including also the provinces bordering on the Yang-tse, together with Chekiang and Honan.

The British Policy in China.—The British sphere of influence has been held to include all the Yang-tse Valley territories, and more than one-half of the province of Kwang-tung. In the course of the year there has been a great deal of discussion as to what Great Britain's future policy toward China would probably be. Its importance appears from the fact that the portion of China comprised within the British sphere of influence makes up about one-half of the Chinese Empire. If Great Britain consents to the partition of China, and if the so-called sphere of influence becomes virtually annexed by foreign powers, some serious difficulties are likely to arise. Apart from the moral side of the question, it is held by some to be a mistake to attempt the annexation of the Chinese territories. The hatred of the Chinese for foreigners and the stubbornness of their character present grave obstacles to anything like an assimilation to the peoples of the west. It has been said that since the war with Japan the tendency has been as much to underestimate the fighting capacity of the Chinese as it was to overestimate it before that war. The complete collapse of the military and naval power of the Chinese at that time was due, it is said, to mismanagement and lack of discipline, and not to any incapacity for fighting on the part of the people. It is thought that so hardy and stubborn a race would make good fighting material in the hands of skilful officers, and, when stimulated by race hatred, would be very hard to subdue. That race hatred continues to be a powerful motive among the Chinese is attested by the recent formation of a good many anti-foreign societies, both secret and open, whose influence is widespread and shows itself from time to time in outbreaks against foreigners.

A writer in a British review, who has had much experience in Chinese affairs, sees little prospect of success in any scheme for actual occupation. He thinks, however, that the aim of British policy should be the control of the administration of the provinces within its sphere of influence, this control to be quietly and gradually introduced and to be made, so far as possible, to harmonize with the spirit of the people. It is his idea that the provinces should be governed through the native officials, thus preventing all actual contact between the Chinese and the hated foreigner. Everything should be directed from above, and the power at the centre should be a British resident. This distant and mysterious force would, he thinks, give little concern to the slow-minded natives, who seem to care only for their local affairs, and who have little of that patriotism which would impel a western nation to resist foreign interference with its central government. Under British control the native administrators would be trained in government and gradually a more enlightened and progressive system would be devised. The constant extortions practised by the present officials would be prevented and the condition of the people improved, and, the whole thing being done silently and from afar, race antipathies would not be aroused. As to the necessity of such a course it is urged that revolts most dangerous to British interests are likely to break out at any moment. As matters stand now the British subject would have to appeal to Russia for protection, owing to the lack of British military forces in that region. There is no knowing when such a movement as the Tai-Ping rebellion might recur. The safety of British interests and the welfare of the people require the presence of a strong force and the maintenance of effective control in order to suppress such disorders at the start.

These and other suggestions have been made in regard to the proper attitude of Great Britain toward the Chinese question. In general, however, the attitude of

Lord Salisbury's government has been unaggressive. It has aimed to maintain the open door and prevent partition, and, on the whole, it has been favorably received.

Lord Beresford's Mission.—The results of Lord Beresford's investigation of the commercial situation in China in the course of the mission which he undertook on behalf of the British Associated Chambers of Commerce in 1898, were summed up in his book, *The Break-up of China*, which was published in May, 1899. His main argument is that the break-up of China would not only be disastrous, but needless, and he is an advocate of the "open door" policy as against the doctrine of "spheres of influence." The open door policy, he says, meets with the support of all the British trading communities in China. The rulers themselves professedly incline to it, though they do not speak encouragingly of its prospects. They emphasize the difficulty of opening China to trade, and especially of affording adequate security to the foreign trader. Lord Beresford holds that to maintain the open door policy is a work of extreme difficulty, and that its success will depend mainly upon the energy and ability which the commercial classes bring to the task. Without the active co-operation of these classes the government cannot maintain the open door. But what the government must do in order to insure the success of this policy is practically to assume the charge of almost every department of internal administration. Lord Beresford complained that foreign trade with China is hampered in every possible way, and that there is little security for property outside the treaty ports.

Currency and National Debt.—Copper cash constitutes the circulating medium through the greater part of China. There are 1800 of these coins to a gold dollar, and, as wages and expenditures are commonly estimated in cash, an idea may be formed of the ordinary schedule of prices. Among foreigners the Mexican dollar is the coin generally used in China, but in the interior block silver, cast in the form of a shoe and stamped to indicate its fineness, is commonly used, pieces of it being cut off and sold to the local banks for their equivalent in copper coin. Besides the Mexican dollar there is the so-called "chop" dollar—that is, a coin which is stamped with the monogram or chop of the issuing firm. In some parts of the country there are imitations of the Mexican dollar, but these do not pass current outside of the vicerealty in which they are minted. The Haikwan tael is the coin used in the customs. Its value on October 1, 1899, was 71.8 cents in United States currency. The tael is merely the name of a weight, and there are twelve other varieties of taels, each differing from the other in value. They represent a Chinese ounce of silver, and the instability in their values results from the fluctuations of the silver bullion. The value of silver coins varies with the business demands in particular localities. When this demand rises the value increases, and when it sinks the value falls to that of the bullion which the coin contains. The fluctuations of silver and the lack of quick communication between markets lead to much confusion in the currency. Some of the banks issue paper currency based on Mexican dollars, and this currency varies in value in the different ports, according to the changes in the value of the silver which the notes represent. Thus, the depreciation of the bank-note may have nothing to do with the insolvency of the bank, but may result solely from the change in the market value of silver bullion. It is a matter of extreme difficulty for the European to determine the value of his gold in the chop dollars which are circulated at the ports. Different banks will give entirely different estimates of the value of gold coin in the ordinary circulating medium. The chief sufferers from this confusion in the currency system appear to be the wage-earning class, since the price of labor does not respond readily to changes in the price of commodities. For example, it was reported by one of the United States representatives in China in 1899 that a recent fall in the value of silver had raised the price of commodities 10 per cent., while wages remained stationary. Since China has for many years imported more than she exported, there has arisen a belief in certain quarters that she is gradually being stripped bare of her silver. This view is reinforced by the supposed drain upon Chinese currency, owing to the need of finding funds to make payments on the loans held abroad, to supply war materials, to support legations, etc. On the other hand, it should be remembered that a good deal of China's foreign trade is not included in the customs statistics, and that the latter do not comprise the income derived from the purchases of provisions and other necessities by foreign vessels touching at Chinese ports, or the amount of money sent to China by her emigrants abroad or brought back by returning emigrants. It has been estimated that \$10,000,000 or \$12,000,000 each year finds its way to China from California alone. In addition there are the sums expended by the various foreign legations and consulates in China and by travellers. All these things tend to offset the drain upon the currency from excess of imports which has occasioned this fear of national bankruptcy. In 1898, moreover, the net import of silver amounted to 4,722,025 Haikwan taels, and there was no evidence in the country that silver was becoming scarce. There was evidence, however, of a scarcity of the

copper cash as compared with that of silver. This has necessitated the minting of subsidiary silver coins in greater quantities.

The liabilities of China were greatly increased as a result of the war with Japan. In 1895 the Chinese government negotiated a loan with Russia and France for \$77,200,000, and later with England and Germany for \$155,728,000. Between 1887 and 1898 it was estimated that the money added to the circulation in China amounted to about £55,000,000. If payments are made at regular intervals, as proposed, the debt will be about \$194,660,000 in 1911. In 1899 the sum due was \$258,030,794.

HISTORY.

Anglo-Russian Agreement.—On April 28, the governments of Great Britain and Russia entered into an arrangement, in regard to China, at St. Petersburg. Its importance can be best appreciated by considering the status of the two powers in China. Russia, it will be remembered, had secured Port Arthur, the future terminus of the Trans-Siberian Railway, and had established her influence over all Manchuria. This region she regarded as in her sphere of influence—that is to say, she exercised it in an actual, though perhaps not an official, control under the guise of developing the railway system. She was now turning her attention toward the south, and apparently desired to expand in the direction of Peking. England, having given up her policy of maintaining the integrity of China, had entered into the general spirit of the new movement, and in the partition of China had tried to secure a good portion for herself. What she had obtained was a promise on the part of the imperial government that it would not alienate to any power any portion of the Yang-tse-Kiang valley, which is said to be the most beautiful and fertile portion of China. This region was in fact her sphere of influence, though it did not appear under that name. Down to the spring of 1899 England's sphere of influence was not recognized by Russia, nor Russia's by England. It was thought that this might occasion trouble in the future. In addition to this general necessity for an agreement, there was a special point of difference between the rival powers on the subject of the so-called Railway of the North, between Tientsin and Shanhai-Kwan, the latter being at the point where the Great Wall reaches the coast of the Gulf of Pechili. This railway had been constructed and was already in operation. The Chinese government, wishing to extend this line as far as New-Chwang, an important point on the Gulf of Liao-Tung, in the direction of Port Arthur, had contracted a loan with the English bank of Hong-Kong and Shanghai, which loan was to be secured by the receipts from the railway. The debate over this New-Chwang railway was carried on sharply during the year 1898, and at one time seemed to threaten serious consequences. One of its clauses, providing for the appointment of an English engineer and a European financial expert, who should have charge of the exploitation of the railway, was displeasing to the Russian government, which declared that it was violative of the engagements made between China and Russia in that it established a species of control on the part of a European power to the north of the Great Wall. On the other hand England held the Chinese government to its engagement with the Bank of Hong-Kong and Shanghai. The arrangement of April 28 had to do with both the general questions of spheres of influence and with this specific difficulty over the New-Chwang contract. In regard to the former matter the two powers declared that they were animated by a sincere desire of avoiding in China every cause of conflict, and that, taking into consideration the economic and geographical condition of certain parts of the empire, they had agreed upon the following arrangement: Russia was not to demand railway concessions in the basin of the Yang-tse, and was not to oppose the demands for concessions in that region on the part of England. England, on her side, made the same engagement in regard to the portion of China lying north of the Great Wall. Thus, it is a reciprocal recognition on the part of England and Russia of their respective spheres of influence in China, but the words spheres of influence did not occur, the expression of spheres of concessions and of exploitation of railways being used instead. An assurance was given that the two powers had no intention of encroaching upon the sovereign rights of China or upon existing treaties. As to the New-Chwang railway England carried her point in that the Chinese government was empowered to nominate an English engineer and a European accountant, but it is understood that this fact shall not establish a right of property or foreign control and that the line shall remain Chinese and under the control of the Chinese government, and shall not be leased by or alienated to any company that is not Chinese. The arrangement was well received at London, since it seemed to insure to England the sphere of the Yang-tse as well as to safeguard the interests of the English subscribers to the loan of the Hong-Kong and Shanghai bank. This satisfaction was diminished a few days later when the news came from Peking that Russia demanded from the Chinese government the right to construct a new line which should unite Peking with the Russian railway of Manchuria. Two routes were men-

tioned, the one starting from Peking and extending in a straight line northward, the other running to the northeast in the direction of Shanghai-Kwan, New-Chwang, and Port Arthur. It looked like the extension of Russian influence to Peking, and if the second route were adopted it could hardly fail to cause economic injury to the New-Chwang line constructed by the English, since it would run parallel to that line and take its traffic. Still more serious was the suspicion that Russia, in extending her influence to the south of Peking, was encroaching upon the Yang-tse. Protests accordingly followed from London. Technically there was nothing in the attitude of Russia that was contrary to the arrangement of April 28, since no portion of that convention prohibited the construction of the projected line, and nothing in it declared that Russia's influence should be confined to the country north of the Great Wall. The English position was that in having recognized the influence of Russia only to the north of the Great Wall she reserved for herself the right to oppose that influence in the south. It was evidently the hope of the English that the country between their sphere and that of Russia would be a sort of neutral ground or buffer.

The Italian Claim.—In 1899 the Italian government, with the approval of Great Britain and Japan, attempted to secure a concession at San Mun Bay, on the coast of the province of Che-kiang. The other powers acquiesced in this policy of Italy's, but Russia was said to be opposed. The Italian demand was for the harbor of San Mun, with the surrounding district, at a radius of about the same length as that which measured the German concession at Kiao-chau, and it also included three islands off the coast, and, in general, the same terms as the Germans had received, comprising preferential railway and mining rights and the permission to construct a railway line from the coast to Po-yang Lake. It also included the recognition of an Italian sphere of influence over two-thirds of the province of Che-kiang. The Chinese foreign office refused the demand in rather sharp terms, owing to the fact that through some mistake the Italian minister had presented the demand in the form of an ultimatum. Upon the explanation of the mistake the Chinese authorities apologized for the tone of their refusal, but did not withdraw the refusal itself. For a time the matter was in doubt. It occasioned some sharp discussion in the Italian parliament. It was finally reported, however, that the demand was withdrawn and an earlier demand for mining and railway concessions was pressed in its stead. See ITALY (paragraphs on History).

England and the Open Door.—In June, 1899, the Chinese policy of the government was sharply criticised by Lord Beresford, who said that while the ministry had constantly declared themselves in favor of the policy of the "open door," they had all along been moving in the direction of "spheres of influence." The reply of the government was that they had not abandoned the former policy or adopted the latter. They were not, however, prepared to go to all lengths in maintaining the integrity of the Chinese empire. They were aiming rather at securing for Great Britain its full share of the advantages to be had from the opening up of China. British concessionaries had already received grants for 2800 miles of railway, and they also had acquired their full share of mining privileges. The government could not see its way to incurring the responsibility of the internal government of China, but it declared its intention of protecting and maintaining the interests of British trade. Its aim was to secure the free transit of trade under passes, its exemption from the likin tax, and from all undue taxation, and the effectual opening up of the inland waters to navigation and of new ports of trade. They intended to hold the Chinese government to the non-alienation of the Yang-tse region, and to the right of British investors to construct a railway between Burmah and the Yang-tse. Not a monopoly of rights, but a fair share was the aim of the British government, and among the instances cited of the success of this policy were the agreement for a line from Tientsin to Ching-kiang, which would lie partly within the German sphere of influence and partly in the British, the Germans to construct their portion of the line and the British theirs, and the agreement with France that whatever concessions should be made in the provinces bordering on Tonquin the trade of other powers should not be excluded from that region. The government showed a willingness to compromise, but it aimed at making a good bargain. It declared that if the occasion arose it would advise the Chinese government not to permit the transfer of the central government at Peking to any other power. This, in general, was the tone of the government's reply to the criticism of the opposition and to questions in respect to the policy toward China. A large part of the opposition demanded that the government should take prompt and effective measures to insure the Chinese government in its independence. But the ministry could not be induced to guarantee directly the integrity of the Chinese empire. In regard to Wei-hai-wei the government announced that it intended to make this port the chief naval base for the eastern squadron. It was said to be the best deep-water harbor on the Chinese coast, and one of the most healthful stations in that part of the world.

The government proposed to make it a secondary naval base and provide it with sufficient fortifications to protect itself against a raid. A naval hospital was to be established there.

Other Events of the Year.—A revolt which threw parts of the interior into confusion during the year 1898 continued in 1899. Before the close of 1898 the rebels of Sze-chuen took a French missionary prisoner, and the French government sent an ultimatum to the Chinese government that unless the missionary was released in ten days French troops would cross the border. The imperial government in reply requested a further delay, and this was granted. During the early part of 1899 the revolt made considerable headway, and there were reports that several cities had been captured by the rebels and that many atrocities had been committed; but in February the imperial troops gained further successes and inflicted heavy losses on the insurgents. The distress caused by the floods of the Yellow River was still acute in 1899, and upon the report of Li Hung Chang the government appropriated money for building dykes and making other improvements in order to prevent similar disasters in the future. In 1899 there were frequent reports of race conflicts of a minor nature. On February 19 it was reported that a riot had occurred between the Chinese and Russians at Talien-wan and that three hundred Chinese were killed. In August what threatened to be a serious conflict arose at Hankow between the British and the Russians over a question of land ownership. A certain piece of land which was included in the Russian concession had been purchased by a British firm many years before. The British owner having sent workmen to fence in his property, the latter were set upon by a body of Russians and driven off. Thereupon a force of marines from a British gunboat landed and mounted guard over the property. Toward the close of August, however, the diplomatic representative of Great Britain and of Russia signed an agreement referring the matter to arbitration. The repeated disturbances at Kiao-chau, arising out of Chinese hatred for the Germans, led the German government in August to give formal warning that unless these troubles ceased a military occupation of the ceded territory would follow in order to guarantee security of life and property. The United States government had its share in the common experience of the weakness or unscrupulousness of the imperial government of China in the matter of fulfilling its obligations. The Hankow-Canton railway concession, as has been stated in a previous paragraph, was an American enterprise, involving not only the construction of a railway, but concessions for the mining of coal and other minerals. In the course of the year there was evidence that the Chinese government was trying to evade its agreement with the American-Chinese Development Company, which was the name of the syndicate that obtained these concessions, and the United States government made the matter the subject of diplomatic negotiation.

CHINIQUEY, Rev. CHARLES PASCIAL TELESPHORE, died in Montreal, Quebec, January 16, 1899. He was born at Kamouraska, Quebec, July 30, 1809; was ordained to the Roman Catholic priesthood in September, 1833, and three years later was appointed curate of Beaufort. Here he began so vigorous a work against the liquor traffic that later he became known as the "Apostle of Temperance;" he was given a vote of thanks and a purse of £500 from the Canadian Parliament and received the benediction of the Pope. In 1852 he founded a colony of about 5000 French-Canadian Roman Catholics at St. Anne, Kankakee County, Ill. Not long after he became involved in disputes with his superiors in the church; these troubles led to legal action, and in 1856 Father Chiniquy was successfully defended by Abraham Lincoln. He had already experienced a change of view in various matters of doctrine; in 1858, along with almost all of the inhabitants of St. Anne, he withdrew from the church. On the 15th of April, 1860, the Presbytery of Chicago held a meeting at St. Anne, and Mr. Chiniquy and nearly 2000 of his followers were received into the Presbyterian communion. For many years he was an active minister in this church, and by his lectures he became well known throughout the United States, England, and the Australian colonies. He was a prolific writer. Among his publications are: *The Manual of Temperance; Fifty Years in the Church of Rome; Papal Idolatry; The Priest, the Woman, and the Confessional; Rome and Education; The Perversion of Dr. Newman to the Church of Rome.* Mr. Chiniquy died in the Protestant faith.

CHITTY, Sir JOSEPH WILLIAM, K.B., a lord justice of the Court of Appeal, died February 15, 1899. He was born in 1828; was educated at Eton and at Balliol College, Oxford, and in 1852 was appointed a fellow of Exeter College, Oxford. He became a barrister in 1856, Queen's counsel in 1874, and was judge in the chancery division of the High Court of Justice from 1881 to 1897. In the latter year he became a privy councillor and was made a lord justice of the Court of Appeal. In 1880-81 he represented Oxford in Parliament.

CHLORETON. A new drug that has been tested systematically during 1899 is

trichlor-tertiary-butyl-alcohol, or chloreton. It is a hypnotic and anæsthetic. As a hypnotic it is found to be useful, especially in the insomnia of the aged and in heart disease with high arterial tension complicating kidney disease. It is useful as a local anæsthetic in the case of wounds, burns, and ulcers. It has been suggested as a possibility that it may be administered internally in seasickness and other cases in which vomiting occurs. It does not irritate the stomach or cause unpleasant sequels, with the sole exception of drowsiness on the day following the use of a large dose.

CHOATE, JOSEPH HODGES, a prominent New York lawyer, was nominated by President McKinley on January 11, 1899, to be ambassador to Great Britain, to succeed Colonel John Hay, who had resigned to accept the portfolio of state in the Cabinet. The nomination was confirmed by the Senate on the 19th of January. Mr. Choate was born in Salem, Mass., January 24, 1832; he was graduated at Harvard in 1852 and at the Dane Law School two years later. In 1856 he settled in New York City, where he has reached the foremost rank in the legal profession. Not only, however, has he gained prominence as lawyer, but as an able orator and ready after-dinner speaker. His appointment to the embassy at the Court of St. James was widely approved, and his first year's work in diplomacy was successful in itself and satisfactory to his countrymen.

CHOLERA INFANTUM. See VITAL STATISTICS.

CHRISTIAN AND MISSIONARY ALLIANCE, formed in 1897, has as subordinate branches the Berachah Home and Berachah Orphanages, the Institute for the Training of Home Workers, and the Missionary Training Institute. President, Rev. A. B. Simpson, 690 Eighth Avenue, New York City; secretary, A. E. Funk.

CHRISTIAN ENDEAVOR, UNITED SOCIETY OF, founded in Portland, Me., in 1881 for the training of young people for the duties of church membership. In 1899 there were in the United States and Canada, Great Britain, Australia, China, India, and Japan, 56,280 societies, with a membership of 3,376,800. Membership is distributed in all evangelical denominations. The United Society is a bureau of information for all the individual societies. President, Rev. Francis E. Clark, D.D., the founder of the society; general secretary, John Willis Baer. An international convention is to be held in London, July 14-18, 1900.

CHRISTIANS, THE, a religious sect of the United States, comprise the Christian Connection and the Christian Church (South). They report for 1899 much progress in missionary, financial, and educational lines, but their membership shows a decrease. In 1899 they had 1452 ministers, 1505 churches, and 112,414 members. The term Christians is applied also to the Disciples of Christ (*q. v.*). The latest report (1899) of the commissioner of education credits the Christians with 17 institutions of learning, 147 professors, 1402 students, and endowment funds aggregating \$818,309.

CHRISTIAN SCIENTISTS (more properly called the Church of Christ, Scientist) are a sect of professing Christians, whose peculiar form of the Christian religion was originated in 1866 by Mary Baker G. Eddy, the author of *Science and Health, with Key to the Scriptures*. Its chief tenets are that Christ's mission in this world was to heal the sick as well as to save the souls of men, and that, in Mrs. Eddy's words, "*Disease is more than imagination; it is a human error, a constituent part of what comprise the whole of mortal existence—namely, material sensation and mental delusion. But an erring sense of existence, or the error of belief, named disease, never made sickness a stubborn reality.*" In some of their unsuccessful efforts to cure disease without medicine they have attracted much attention and no little opprobrium. Whatever may be said for or against them, the doctrines of Christian Scientists are spreading. Their spread may be seen not only in the United States and Canada, but in Great Britain, Germany, France, Norway, Sweden, Bulgaria, South Africa, Australia, China, Japan, and Hawaii. In 1899 the Christian Scientists had 402 chartered churches, an increase of 98 over 1898, and 111 regularly established Sunday services, which when further organized form new churches. There were some 50 church buildings and 102 public reading-rooms for the propagation of the doctrines, an increase of 17 over 1898. The great text-book of the system, mentioned above, reached its 178th edition in 1899, the first having been published in 1875. The First Church of Christ, Scientist, in Boston, Mass., known as the Mother Church, had in 1899 a local membership of 1500 and a so-called general membership of 16,000, or an increase of over 4000 during the year. The whole number of church members in the world is placed at 90,000, an increase of about 20,000, and the avowed adherents are said to number about 500,000. A Christian Science Board of Education was founded in 1898, which, directed by the Massachusetts Metaphysical College of Boston, selects teachers for systematic education in the religion, healing, and obstetrics of the system. There are 62 established institutes in the United States

and Canada. The Christian Scientists now publish a monthly and a weekly periodical. The active ministry, composed of official church readers, teachers, mission workers, practitioners, and lecturers, was in 1899 about 12,000; and the attendance in Christian Science churches is said to have doubled in that year. Forty church edifices were in course of construction, two of them in New York City, to cost an aggregate of \$700,000. A strong effort is being made by the regular medical practitioners in various parts of the country to get legislation against the Christian Science healers, but has failed in many States on the ground that the healers, not employing drugs, cannot be said to practise medicine. An opinion handed down by Judge Bosworth, of the Supreme Court of Rhode Island, voices the attitude of a number of the members of the bench regarding Christian Science. The case was one on appeal, and the higher court reversed the findings of the lower. Judge Bosworth says: "While it is true that the study and treatment of mental disease constitute one of the departments or branches of medicine, in which the influence of the mind over the body is recognized, yet mere words of encouragement, prayer for divine assistance, or the teaching of Christian Science, as testified, in the opinion of the court does not constitute the practice of medicine in either of its branches, in the statutory or popular sense." And regarding the powers of the State Board of Health to pass upon qualifications of applicants for the certificate licensing them to practise medicine, he adds: "The board cannot determine which school or system of medicine in its theories and practice is right. It can only determine whether the applicant possesses the statutory qualifications to practise in accordance with the recognized theories of a particular school or system." It may be added that decisions in favor of Christian Scientists have been reached in the courts of Ohio, Minnesota, and Oklahoma; and that attempts to legislate against them were unsuccessful in New York, Minnesota, Colorado, Maine, and Rhode Island.

It is generally acknowledged that in many diseases the mind can play an important curative rôle in allaying symptoms and permitting the spontaneous remedial activities of the human system to operate. For the attitude of psychologists toward this power of mind over body see the article *SUGGESTION*, in which it is stated that suggestion is the essential element common to Christian Science healing, mind cure, faith cure, psycho-therapeutics, hypnotism, and other forms of cure without the use, or with an ineffectual use, of drugs. The present attitude of the world at large toward Christian Science was characteristically voiced at the June (1899) meeting of the Medico-Legal Society of New York. The arguments against Christian Science and in favor of some legislation restraining Christian Scientists from practising their art of healing, on the one hand, were heard, and the defence of Christian Science by Carol Norton, C.S.D., and John Carroll Lathrop, C.S.B., were listened to. It was pointed out that while religious freedom is permitted by the United States constitution, it is a menace to public health to allow any sect to endanger their lives and the lives of others by refusing regular medical aid and ignoring the usual means of preventing the spread of zymotic diseases. The defence of the Christian Scientists, on the other hand, does not notice this point, but calls attention to the injustice of enforcing any individual to call, in case of sickness of himself or any member of his family, a physician of any one school, thus claiming recognition as a school of medical practice on equal terms with the regular, homœopathic, and other schools of medicine. Again, the Christian Scientists say that they should no more be judged by their failures to cure diseases in individual cases than regularly accepted physicians, and they make a strong claim that their failures are no greater a percentage of the total number of cases than those of regular medical practitioners. The Christian Science religion is so closely connected with their healing art that it has brought them to the extreme position of not only declining to call a regular physician, but refusing to take his medicine. It would seem that the Christian Science tenet that disease is unreal and non-existent would not prohibit them from taking any drugs recommended by regular physicians, as their belief in the sovereign remedial agency of the soul should cause them to think that whatever medicine they took could have no effect whatever.

The following books on Christian Science have appeared during the year 1899: J. M. Buckley, *Christian Science and Other Superstitions* (New York); L. A. Crandall, *Some Facts Concerning Christian Science* (Chicago); Annie Harwood, *An English View of Christian Science: An Exposure* (New York); Willard H. Hinkley, *Modern Theosophy, Christian Science, and Spiritism* (Boston); H. Varley, *Christian Science Examined* (New York); Rev. W. Short, *Christian Science, What it is, What is New and What is True about it* (New York).

CHROMIC IRON ORE. The production of chromic iron ore in California, which has been practically the only domestic source, almost ceased in 1897, and the 1898 supply came almost entirely from Asia Minor. It amounted to 16,304 long tons, valued at \$272,244. Chromite is used to some extent in California as a basic refractory lining for furnaces.

CHURCHILL, LADY RANDOLPH (Jennie Jerome), the daughter of the late Leonard Jerome, of New York, was born in Brooklyn about 1854. She was educated chiefly in France, and in 1874 was married to Lord Randolph Henry Spencer Churchill, third son of the seventh Duke of Marlborough, who died in 1895. Lady Randolph Churchill is vice-president of the Ladies' Grand Council, Primrose League of England. In 1899 she established the *Anglo-Saxon Review*, of which she is editor. In this year she was also instrumental in organizing a fund for the American hospital ship *Maine*, for service in South Africa. She went in this ship to South Africa on the news of the capture of her son, Lieutenant Winston Spencer Churchill, by the Boers.

CHURCHILL, WINSTON, author, was born in St. Louis, Mo., November 10, 1871; he was graduated from the United States Naval Academy at Annapolis in 1894, and married Mabel H. Hall, of St. Louis, October 22, 1895. In 1894 he was one of the editors of the *Army and Navy Journal*, New York, and in 1895 managing editor of the *Cosmopolitan Magazine*. He is a hard worker, painstaking and conscientious. Besides various naval stories that have appeared in the magazine, he has published *The Celebrity* (1898) and *Richard Carvel*, one of the most popular novels of 1899.

CHURCHILL, WINSTON LEONARD SPENCER, son of the Rt. Hon. Lord Randolph Churchill, was born on November 30, 1874. He was educated at Harrow and Sandhurst and entered the army in 1895, in which year he served with the Spanish forces in Cuba and received the Order of Military Merit. In 1897 he served with the Thirty-first Punjaub Infantry, was mentioned in despatches, and received a medal with clasp for his actions at Bajaur. He also served as orderly officer to Sir W. Lockhart with the Tirah Expeditionary Force in 1898, and was with the Twenty-first Lancers in the Nile Expeditionary Force, and for his services at the battle of Khartoum received a medal with clasp. In 1899 he contested Oldham (Conservative), and in 1899 went to the Transvaal. He was taken prisoner by the Boers, with others, in the armored train near Estcourt, November 15, while acting as war correspondent of the *Morning Post*.

CHURCH OF CHRIST, SCIENTIST. See CHRISTIAN SCIENTISTS.

CHURCH OF IRELAND, united to the Church of England in 1800, but disestablished in 1871. The government is by general synod, composed of two houses of representatives, of the bishops, the clergy, and the laity. In 1899 there were 13 bishops, 1200 incumbents, 360 curates, and an estimated church population of 600,700.

CHURCH TEMPERANCE SOCIETY, of the Protestant Episcopal Church, organized in 1881 for the promotion of temperance, has the Church Temperance Legion, an organization of boys' and young men's temperance clubs, maintains six lunch wagons, which supplied 290,475 ten-cent meals during 1899, ten iced-water fountains, coachmen's coffee wagons, and the Squirrel Inn, on the Bowery, New York City. President, the Right Rev. Thomas M. Clark, bishop of Rhode Island; secretary, Robert Graham, 281 Fourth Avenue, New York City.

CILLEY, Professor BRADBURY LONGFELLOW, died at Exeter, New Hampshire, March 31, 1899. He was born at Nottingham, New Hampshire, in 1838. He was graduated at Harvard with the class of 1858. For forty years he was professor of Greek at Phillips Exeter Academy.

CINCINNATI, SOCIETY OF THE, founded in 1783, "to perpetuate as well the remembrance of this vast event (the Revolutionary War) as the mutual friendships which have been formed under the pressure of common danger, etc.," is composed of the general society and the state societies. The next triennial meeting of the general society will be held in Hartford, Conn., in May, 1902. President of the general society, Hon. William Wayne, Pennsylvania; secretary, Hon. Asa Bird Gardiner, Rhode Island. Offices, Garden City, L. I. There are state societies in active membership in Massachusetts, Rhode Island, New York, New Jersey, Pennsylvania, Maryland, South Carolina, and Virginia.

CIVIL ENGINEERS, AMERICAN SOCIETY OF, founded in 1852, had in 1899 a membership of 2227. General meeting for 1900 at London, England, June 2-7. The society publishes *Proceedings* (ten months in the year) and semi-annual *Transactions*. President, John F. Wallace; secretary, Charles Warren Hunt, 220 West Fifty-seventh Street, New York City.

CIVIL SERVICE REFORM. See UNITED STATES.

CLAPP, ALEXANDER HUNTINGTON, D.D., well-known Congregational clergyman, died in New York, April 27, 1899. He was born at Worthington, Mass., September 1, 1818. He studied at Phillips Academy, Andover; was graduated at Yale in 1842, and at the Andover Theological Seminary in 1845. Entering the Congregational ministry, he preached in Brattleboro, Vt., from 1846 to 1853, and in

Providence, R. I., from 1855-1865. From the latter year to 1878 he was secretary of the American Home Missionary Society; for a number of years he also acted as its treasurer, and later became editor of *The Home Missionary*, the official organ of the society. From 1875 to 1895 Dr. Clapp was the New York editor of the *Boston Congregationalist*. He edited *Lives of the Presidents* and other works.

OLARK CELL. See PHYSICS.

OLARK, WILLIAM ANDREWS, United States Senator from Montana, was elected, as a Democrat, by the legislature on January 28, 1899, eleven Republican members voting for him, to succeed Senator Lee Mantle, Silver. He is a millionaire capitalist, and it was alleged that the election was effected by extensive bribery in the legislature. An investigation of the matter was instituted after Congress convened, and was referred to the Senate committee on privileges and elections, but at the close of 1899 no decision had been rendered. Mr. Clark was vigorously opposed in his election by Mr. Marcus Daly, the Anaconda mining capitalist. Born near Connellsville, Penn., January 8, 1839, Mr. Clark received an academic education and studied law at Mount Pleasant (Iowa) University, but never entered the legal profession. In 1850-60 he taught school in Missouri, removed to Colorado in 1862, and to Montana in the following year. Since that time he has been engaged in mercantile business, banking, mining, and manufacturing, and has come into possession of large interests. He is the proprietor of the *Miner* newspaper, and owns the tramways of Butte. At the Centennial Exposition in Philadelphia he represented Montana as orator for the territory. As major he led the Butte battalion in the Nez Percé campaign of 1878. In 1884 he served as commissioner from Montana to the New Orleans exposition, and in 1884 and 1889 was chairman of the Montana constitutional conventions. He was the Democratic nominee for United States Senator in 1890, and claimed the election, but was not seated.

OLARKE, JOHN SLEEPER, a famous comedian, died in London, September 25, 1899. He was born in Baltimore, Md., September 3, 1833. He made his début in Boston in 1851, and the next year appeared in comic rôles at the Chestnut Street Theatre, Philadelphia; his first appearance in New York was in 1861. Clarke rose to the first rank of comedians and also became well known as a theatre manager. For a time he was a partner of William Wheatley in the management of theatres in Baltimore and Philadelphia; from 1864 to 1867 he was a lessee with his brother-in-law, Edwin Booth, of theatres in New York, Philadelphia, and Boston. In the latter year Clarke went to England, where he thereafter resided. He did not relinquish, however, at that time his theatre holdings in this country, and it was not until 1887 that he disposed of his Philadelphia property. In London he was for a time joint manager with the late E. A. Sothorn of the Haymarket Theatre, and for many years before his death he was owner of the historic Strand Theatre. Clarke appeared on the American stage repeatedly between 1870 and 1881. Among his rôles once famous but now perhaps almost forgotten were: Dr. Pangloss in *The Heir at Law*; Major de Boots in *A Widow Hunt*; Farmer Ashfield in *Speed the Plough*; Tyke in *The School of Reform*; Timothy Toodle in *The Toodles*.

OLARKE, ROBERT, a Cincinnati publisher, died at his home in Glendale, O., August 26, 1899. He was born in Dumfriesshire, Scotland, May 1, 1829; in 1840 he removed with his parents to Cincinnati, and he was educated at Woolward College in that city. He entered the book trade, and afterward changed to the publishing business, in which he achieved a marked success. At the time of his death he was president of the publishing and bookselling house known as The Robert Clarke Company. Clarke has issued many volumes relating to the early history of the Northwest Territory and to the Civil War. Of his own writings there have been published articles on archæological and historical subjects. He edited *Pioneer Biographies* and Colonel George Roger Clarke's *Campaign in the Illinois*. Clarke was a fellow of the American Society for the Advancement of Science.

OLARY and ALDRINGEN, CARLOS, COUNT VON, premier of Austria, succeeded Count von Thun-Hohenstein in this position, and formed a ministry on October 2, 1899. The ministry of Count von Thun-Hohenstein lasted from March 7, 1898, to September 3, 1899, when it resigned. Count von Clary is the head of a noble and ancient Austrian family, and was born in Vienna on April 3, 1844. He succeeded to the estates on the death of his father, Count Edmund Moritz, June 21, 1894. He is a privy councillor and a hereditary member of the upper house of the Austrian government. For an account of the Clary ministry, see AUSTRIA-HUNGARY (paragraphs on History).

OLAY. The production in the United States during the year 1898 was unprecedented, and exceeded that of 1897 by over \$9,000,000. The statistics for the year are as follows:

Variety.	1897.	1898.
Common brick.....	26,430,207	29,961,992
Pressed brick.....	3,855,033	3,495,097
Paving brick.....	3,582,037	3,922,642
Fancy bricks.....	685,048	632,165
Firebricks.....	4,094,704	5,579,761
Drain tiles.....	2,623,305	3,026,213
Sewer pipe.....	4,069,534	3,651,206
Terra-cotta.....	1,841,422	1,979,825
Fireproof.....	1,979,259	1,846,092
Tile, not drain.....	1,476,638	1,731,024
Miscellaneous.....	1,413,595	1,818,089
Pottery.....	10,309,209	13,952,674

Ohio ranked first among the clay-producing States, followed by New Jersey, Illinois, New York, and Pennsylvania. The imports of clay products in 1898 amounted to \$755,268. Among the important publications bearing on this subject issued during the past year is a report on the clays of Georgia by G. E. Ladd, *Bulletin of the Georgia Geological Survey*; the manufacture and the use of paving brick in the middle West, H. F. Bain, *Mineral Industry*, Vol. VII., page 135.

CLEMENT, NATHANIEL H., ex-justice of the New York State Supreme Court, was born at Tilton, N. H., March 23, 1844; died in Brooklyn, N. Y., March 3, 1899. After his graduation from Dartmouth College in 1863 he served for a short time with the cavalry in the Civil War. During the latter part of the war he was a clerk in the treasury and war departments. Subsequently he removed to Brooklyn, studied law, and in 1882 was made a judge of the city court, and its chief justice in 1887. Upon the abolition of this court in 1894 he was elevated to the supreme bench. His term expired in 1896.

CLIFDEN, Fifth Viscount, LEOPOLD GEORGE FREDERICK AGAR-ELLIS, M.A., died September 10, 1899. Born May 13, 1829, and educated at Trinity College, Cambridge, he became in 1856 aide-de-camp to Earl Carlisle, lord-lieutenant of Ireland, continuing to 1864. He sat in Parliament for Kilkenny from 1857 to 1874, and in 1886 represented East Hampshire as a Liberal. His heir was Baron Robartes.

CLIMATOLOGICAL ASSOCIATION, AMERICAN, held its sixteenth annual meeting in New York City, May 9-11, 1899. The president, Dr. Beverley Johnson, in his opening address declared his belief that in the near future the physician would become more than ever before the counsel and guide in all matters affecting the public health. Officers elected: President, Abraham Jacobi, M.D., New York City; secretary, Guy Hinsdale, M.D., Philadelphia, Penn.

COAL. The production of coal in the United States in 1898 amounted to 219,974,667 tons, which is the largest production on record, and which exceeded that of 1897 by nearly 10 per cent. About 75 per cent. of this output came from the Appalachian coal region. The production was distributed as follows, the figures being those issued by the United States Geological Survey:

COAL PRODUCT OF THE UNITED STATES IN 1898, BY STATES.

STATE.	Number of mines.	Loaded at mines for shipment.	Sold to local trade and used by employees.	Used at mines for steam and heat.	Made into coke.	Total production.	Total value.	Average price per ton.	Average number of days active.	Average number of employees.
		Short tons.	Short tons.	Short tons.	Short tons.	Short tons.

The estimated production for 1899 is 56,697,525 short tons of anthracite, and 187,843,750 short tons bituminous. There have been no notable discoveries of new fields in 1899, but there has been a general increase in production all over the country, which has been aided by the absence of any large strikes.

The theory has been brought forward by Gresley that a large proportion of coal is made up of tiny rod-like forms of plant origin, which are composed chiefly of pitchy matter. He also considers that the presence of thin shaly seams found in coal is due to the fact that whenever organic matter which gives rise to coal-beds is washed into the waters where it has accumulated it is mixed up with more or less fine mud, and that, owing to the rapid settling of the vegetable matter and the slower settling of the suspended clay, the latter is deposited upon the former, thereby forming a thin layer.

The question of coal supply in the Far East is becoming interesting in view of the present struggle going on between the European powers. Great Britain and Japan at present control most of the good supplies, although the Dutch obtain much good coal from their own possessions. The Philippines after exploration will doubtless yield good fuel. Jordan, in treating of the mining industry of Japan, states that coal production leads. The coal is of tertiary age, and is used locally and exported. Simmersbach gives the following necessary requirements for good coke for metallurgical purposes: (1) Not over 4 per cent. of water; (2) not over 9 per cent. of ash; (3) not over 1 per cent. of sulphur; (4) not over 18 per cent. of phosphorus; (5) not over 6 per cent. of fine coke in any shipment; (6) a crushing strength of at least 1140 pounds per square inch. Among the books issued during 1899 is one on *The Chemistry of Coke*, by W. C. Anderson.

The following table gives the production of coal in other countries, the figures being for the latest year for which statistics are available (*Jour. Iron and Steel Inst.*, 1899, I):

Country.	Year.	Production in Tons.
Australia

COATS, JOSEPH, M.D., editor of the *Glasgow Medical Journal*, died January 23, 1899. He was born at Paisley, Scotland, February 4, 1846, and was educated at the universities of Glasgow, Leipzig, and Würzburg. In 1876 he became president of the Pathological Society and of the Medico-Chirurgical Society in 1891. He accepted the editorship of the *Glasgow Medical Journal* in 1878 and the professorship of pathology in the University of Glasgow in 1894, both of which positions he retained to the time of his death. Among his writings are: *A Manual of Pathology*, 1883, and *Lectures on Tuberculosis of the Lungs*, 1888.

COBALT. The domestic production of cobalt oxide in 1898 came from Mine la Motte, Mo., and amounted to 6247 pounds, valued at \$11,772. The production was nearly 70 per cent. smaller than that of 1897, but the price per pound slightly higher. The amount of cobalt oxide imported to the United States in 1898 was 33,738 pounds.

COCHIN CHINA is a name now applied to the French colony on the southern extremity of the eastern portion of the Indo-Chinese peninsula. The name was formerly identified with and is still loosely applied to the former empire of Anam, which included three distinct regions—namely, Lower Cochin China (now the French colony, Cochin China), Upper Cochin China (now the French protectorate, Anam proper), and Tonquin. The present French possessions in these regions are now, with the adjoining French protectorate Cambodia, which was partly in the Anamese empire also, grouped under the name of Indo-China. For an account of these possessions see COCHIN CHINA, LOWER; ANAM; TONQUIN; and CAMBODIA. See, also, INDO-CHINA.

COCHIN CHINA, LOWER, or FRENCH COCHIN CHINA, is a French colony, occupying the southeastern extremity of the Indo-Chinese peninsula. It occupies but a small part of the territory embraced within the former empire of Anam, a region still loosely called Cochin China. (See COCHIN CHINA.) Its area is about 23,000 square miles, and stretches from Cambodia and Anam on the north to the China Sea and the Gulf of Siam. Its population, about 2,035,000, includes between 4500 and 5000 French settlers. There is an army of occupation of 1830 French soldiers, also, besides about 3000 Anamese troops. The development of the colony under French rule has been successfully carried on for some years. Schools, telegraph lines, and railroads have been introduced, and a good trade has been built up. Rice, the principal product, is exported in large quantities to China, Java, and Europe. Other exports are cotton, hides, fish, pepper, and copra. With Anam, Cambodia, and Tonquin it forms French Indo-China. See INDO-CHINA.

COFFEE. Up to 1898 the world's production of coffee was on the increase; the annual output at present is probably more than 13,000,000 bags of 125 pounds each; according to a recent report, the production for 1897-98 was considerably

larger—2,055,768,000 pounds. The recent depreciation of coffee has been due to an oversupply, since the normal consumption is estimated at 12,000,000 bags; and in February, 1899, the world's visible supply was more than 5,700,000 bags, while it was probable that the next crop would suffice for current consumption. The excessive production has been largely due to the Brazilian crop, and the consequent annual decrease in the net receipts of the coffee producers of Latin America is estimated at \$32,000,000 gold.

For the year ending June 30, 1898, the gross importations of coffee into the United States was 870,636,254 pounds, valued at \$65,079,914, or an average of nearly 7½ cents a pound. Of this amount, over 18,800,000 pounds were re-exported or received in transit for foreign countries. About 76 per cent. of the gross importations, representing something more than 63 per cent. of the total valuation, came from Brazil. This country and the other American coffee-producing countries supplied about 95 per cent. of the total importations, representing about 91 per cent. of the total value. The increased importation in 1898 over 1897 was nearly 133,000,000 pounds, but the decline in value amounted to nearly \$16,500,000—that is, the average gross price in 1897 was 11.1 cents a pound and in 1898 about 7.48 cents. The importation for the calendar year 1898, however, was slightly less than that for the calendar year 1897. The importation for the year ending June 30, 1899, was 836,693,053 pounds, valued at \$55,286,429, or 6.6 cents a pound. This is a falling off of 33,943,201 pounds from the importation of 1898, and a depreciation of about 88 cents a pound. But the importation into the United States for the year ending December, 1899, was 878,197,981 pounds, valued at \$56,068,980. Of this amount, Brazil supplied 674,461,411 pounds; other South American countries, 83,177,862 pounds; Central America, 45,303,668 pounds; Mexico, 31,657,552 pounds; the East Indies, 14,053,872 pounds. The importation into the United States for the year ending December, 1898, was 804,263,935 pounds, valued at \$53,654,280. At the close of 1899 coffee was appreciating. Rio Standard No. 7 was valued at New York at 7 cents a pound on December 30.

Though the world's production in 1898 was said to be about 10 per cent. less than the crop of the previous year, the enormous total of 15,955,228 bags of 132 pounds each is reported. The following is the estimated production by countries for 1898:

Countries.	Pounds.	Bags.	Authority.
Brazil.....	1,583,840,000	11,620,000	United States consul.
Venezuela.....	116,407,800	881,877	Exports, October to October.
Guatemala.....	60,238,000	456,424	Native estimate.
Haiti.....	57,000,000	431,812	Dunring and Toon.
Mexico.....	48,145,492	364,729	Official.
Costa Rica.....	35,461,407	267,889	do.
Colombia.....	34,649,639	264,770	Estimated.
Puerto Rico.....	20,400,000	200,000	Spanish estimate.
Salvador.....	16,500,000	125,000	Dunring and Toon.
British West Indies.....	13,200,000	100,000	do.
Ecuador.....	9,858,692	74,681	British report.
Peru.....	2,733,305	20,707	"El Comercio."
Santo Domingo.....	2,400,700	18,187	Belgian report.
Dutch West Indies.....	924,000	7,000	Estimated.
Hawaii.....	736,000	5,500	Partly official.
Honduras.....	612,480	4,640	British estimate.
Bolivia.....	495,000	3,750	Estimated.
Paraguay.....	343,407	2,602	United States consul.
Dutch Guiana.....	219,186	1,660	British estimate.
Cuba.....	132,000	1,000	Estimated.
British Honduras (Belize)....	132,000	1,000	do.
Total, America.....	1,960,619,288	14,853,228	
Java.....	101,904,000	772,000	Dunring and Toon.
Ceylon and British India....	31,680,000	240,000	do.
Padang.....	5,940,000	45,000	do.
Celebes.....	5,940,000	45,000	do.
Total, Asia and Africa.....	145,464,000	1,102,000	
Grand total.....	2,106,083,288	15,955,228	

The estimated coffee product of the world for the year ending June 30, 1900, is 15,285,000 bags of 134¼ pounds each, apportioned as follows: Brazil, 10,500,000 bags, 6,000,000 being accredited to Santos, 3,750,000 to Rio de Janeiro, and the remainder to other Brazilian ports; Mexico and Central America, 1,500,000 bags; Venezuela and Colombia, 1,250,000; Java, 650,000; the West Indies (chiefly Cuba,

Haiti, and Puerto Rico), 550,000 bags; British India and Manila, 300,000 bags; Arabia and Africa, 250,000 bags; Ceylon, Sumatra, and other East Indian islands furnishing the remainder.

The annual per capita consumption of coffee in several countries of the world is as follows: Holland, 23 pounds; Belgium, 11; United States, 9.95; German, 5.25; France, 3.25; Great Britain, 0.7.

In order to increase the price of coffee, a gigantic combine was proposed early in 1899 by Señor J. A. Olavarria, of Caracas, Venezuela. He suggested that the government of Venezuela should take the initiative by inviting the other coffee-producing countries to be represented at a conference, to the end of forming an international combination for restricting the output. His plan was at present to limit the annual export to 10,500,000 bags, Brazil being allowed 6,600,000 and the remainder proportionally divided among all other countries. Upon the coffee exported would be levied a duty of one dollar a bag, the proceeds thus gained to be applied to buying up the surplus production and to taking measures to bring about an increase in consumption and a decrease in import tariffs in non-coffee-producing countries. A secondary advantage, Señor Olavarria points out, would attach to the governments forming the combine through the increase of import customs consequent upon the increased volume of money among the coffee-producing classes. The increasing surplus would occasionally be reduced by poor crops, but it would seem probable that general liquidation would be expedient at the end of five years, when the surplus might amount to 5,000,000 bags. Liquidation would be effected by putting the surplus on the market and purchasing on the tree an equivalent amount, which should be allowed to rot. Señor Olavarria develops his plan for the league with considerable detail, but against it seems to be not only sound economic theory, but very real obstacles of practical politics.

COGHLAN, CHARLES, actor, died at Galveston, Tex., on November 27, 1899. In light comedy he was one of the best actors on the English-speaking stage. Coghlan was born in Paris in 1842. He took up acting at the age of eighteen. After playing inconspicuously through the English provinces, he appeared in 1870 at the Prince of Wales Theatre and took immediately a prominent place among English actors. Here he was associated for some time with Ellen Terry, and in 1875 he attempted, in a revival with Miss Terry of *The Merchant of Venice*, to reach at a bound the foremost place on the stage. At the same time Henry Irving presented *The Bells* at the Lyceum and completely triumphed over Coghlan in public favor, to the latter's lifelong disappointment. He was introduced in America in 1876 at Daly's in *Money*, and has been prominent here since. One of his best productions was *The Royal Box*. He was also a successful writer and adapter of plays.

COGHLAN, JOSEPH BULLOCK, captain, U.S.N., who took part in the battle of Manila Bay, May 1, 1898, brought himself into notoriety in 1899 by his speech at a dinner given in his honor at the Union League Club, New York, where he criticised the conduct of the German officers toward the Americans during the blockade at Manila. The German press magnified the incident, and it was thought by some to threaten trouble between Germany and the United States. Captain Coghlan was reprimanded by President McKinley. Coghlan was born in Kentucky, was appointed to the United States navy in 1860, became ensign in 1863, lieutenant in 1866, lieutenant-commander in 1868, commander in 1882, and captain in 1896. Since 1897 he has commanded the *Raleigh*, which returned to New York in the spring of 1899.

COINS, VALUE OF FOREIGN. The following tables show the official valuation of foreign coins by the United States treasury: First, in the case of countries with fixed currencies; and, second, in the case of countries with fluctuating currencies, giving the quarterly valuations of the latter during the year 1899.

A.—COUNTRIES WITH FIXED CURRENCIES.

The following official (United States Treasury) valuations of foreign coins do not include "rates of exchange."

Countries.	Standard.	Monetary unit.	Value in U.S. gold.	Coins.
Argentine Republic*.	Gold and silver..	Peso.....	\$0.965	Gold—Argentine (\$1.82,4) and $\frac{1}{4}$ Argentine; silver—peso and divisions.
Austria-Hungary†....	Gold.....	Crown903	Gold—20 crowns (\$4.05,2) and 10 crowns.
Belgium.....	Gold and silver.	Franc.....	.193	Gold—10 and 20 franc pieces; silver—5 francs.
Brazil.....	Gold.....	Milreis.....	.546	Gold—5, 10, and 20 milreis; silver— $\frac{1}{4}$, 1, and 2 milreis.

* In 1874 and 1875, the gold standard prevailed.

† The gold standard was adopted October 1, 1892. Values are still, however, frequently expressed in the florin or guilder, which is worth 2 crowns or 40.6 cents.

A.—COUNTRIES WITH FIXED CURRENCIES.—*Continued.*

Countries.	Standard.	Monetary unit.	Value in U.S. gold.	Coins.
British North America (except Newfoundland).	Gold.....	Dollar.....	1.00

COKE. The total production of coke in the United States in 1898 was 15,897,797 tons. In the twelve months of 1899 the production was 19,344,883 tons, the increase being due chiefly to the great activity in iron manufacture. A development of great importance in coke manufacture is the utilization of the by-products of gas, ammonia, tar, etc., by the use of special ovens for the purpose. This has rendered the coals of several localities available for coke manufacture which have previously been considered unavailable, owing to their high sulphur contents or to their large percentage of volatile matter. Pennsylvania, Alabama, and Kentucky are the three principal coke-producing States.

COLENSO, Rev. WILLIAM, F.R.S.E., missionary and naturalist, was born at Penzance, England, and died in New Zealand about February 10, 1899, at the age of eighty-seven years. In 1833 he went to New Zealand as a missionary and printer for the Church Missionary Society, and printed the first book published in the islands. Mr. Colenso was regarded as an authority on the natural history of New Zealand and on Maori antiquities and myths.

COLLEGE SETTLEMENTS. With the close of the year 1899 the College Settlements Association, whose work in social settlement has been among the foremost efforts of the kind, reached its decennial anniversary. During the ten years of its existence the association has grown from representation in four colleges, Smith, Vassar, Wellesley, and Bryn Mawr, to the possession of chapters in twelve colleges, the additional ones being Radcliffe (at Harvard), Wells, Packer Institute, Swarthmore, Elmira, Women's College of Baltimore, Barnard (at Columbia), and Sage College (at Cornell). Its subscription list reaches \$6000, a sum derived chiefly from college and professional women. During the period referred to, the extension of the settlement movement has been large, including the founding of the Rivington Street Settlement, reaching into several buildings, at New York; the Hull House, at Chicago; a large Philadelphia settlement, which during the year 1899 was newly housed and located, with a prospective gymnasium and a public hall; and a Boston house. Other enterprises throughout the country number in all about eighty settlements. These settlements run from the simplest possible form to the more elaborately organized institutional houses, but all except a few include the idea of neighborhood residence as well as neighborhood work. The large settlement colonies at New York, Philadelphia, and Boston, all of which are administered by the College Settlements Association, report rapid growth during 1899. Since the previous report the Boston settlement has rented the basement and ground floor of the building adjoining Denison House, the settlement's headquarters, for the use of cooking classes and for a boys' club and a men's reading-room. The programme of the organized settlement work in educational and social matters includes nearly fifty weekly engagements. At New York the Rivington Street house is overcrowded, and as the two houses of the settlement were full early in the year, additional rooms were taken in a near-by tenement. This settlement is doing especially good work among the young people of the slums through its literary, social, and athletic clubs, its industrial classes, and its home improvement and city history societies. The library occupies more space than formerly on the daily schedule, being open one more afternoon during the week, and is rendered more effective by systematic management and good additions to its shelves. The kindergarten, fresh air, and summer home departments were other noteworthy branches carried on successfully during the year. The Philadelphia settlement, having been forced out of its house by the demolishing of the tenement houses about Rodman Street, is now at work on plans for the purchase of a double house, to be altered into a residence suitable for settlement purposes. It is also intended that a public hall and a gymnasium shall be acquired at the earliest possible day. A recent gift of \$3000 was made toward aiding the accomplishment of this aim. The Philadelphia settlement is also urging the city council to transform the old slum square, formerly occupied by the tenements, into an open space for park purposes, making an improvement similar to that carried out by New York in the old Mulberry Bend district. The Philadelphia tenement district above mentioned is a populous one, there being 11,000 children in attendance at a dozen public schools within a radius of four blocks of the settlement house. The statement of the year shows the following record of work done in this neighborhood: Kindergartens, 100 children; social and study clubs and classes, 193; dancing classes, 50; gymnasium classes, 55; sewing classes, 91; English classes, 25; bank depositors, 351; circulating picture-library, 19 members; average attendance at the public settlement meetings, 336; total number influenced by above activities, 1219. About 1900 patients were treated, under the Visiting Nurse Society, by various serving physicians. Some 800 or 900 were benefited by the special summer work, including play-ground privileges, open-air parties, and concerts, picnics, and kindergartens. The Settlement Country Club, boarding residents at a very small cost, had fifteen regular and 55 transient

inmates per week during two months of the summer. The officers of the College Settlements Association are: Vida D. Scudder, Boston, president; Mabel G. Curtis, Boston, secretary. At the New York settlement Susan G. Walker is chairman of the local executive committee, and Elizabeth S. Williams is the head worker; at Philadelphia, J. Rodman Paul, chairman, Anna F. Davis, head worker; Boston, Cornelia Warren, chairman, Helena S. Dudley, head worker.

COLLETT, JOHN, M.D., Ph.D., formerly state geologist of Indiana, and a well-known business man of Indianapolis, died in that city March 15, 1899. He was born at Eugene, Ind., January 6, 1828; was graduated in 1847 at Wabash College, Crawfordsville, and later at the Central College of Physicians and Surgeons, Indianapolis. From 1870 to 1873 he served in the Indiana senate. During this time and until 1878 he was assistant state geologist, and in the latter year and in 1879 was a member of the New State House Commission. In 1879-80 Dr. Collett was chief of the bureau of statistics and geology, and from 1881 to 1885 served as state geologist. Besides a large number of papers on geology he published six volumes of geological reports with many maps and figures. Some of his works are regarded as authorities in this country and abroad.

COLOMB, PHILIP HOWARD, vice-admiral of the British navy, retired, died at his home in Botley, Hampshire, October 14, 1899. He was one of the greatest English authorities on naval affairs. Colomb was the third son of General G. T. Colomb, and was born in Scotland May 29, 1831. He was educated privately, and in 1846 entered the navy; in the following year he participated off the coast of Portugal in the suppression of an insurrection. In the revolutionary period of 1848 he served in the Mediterranean, and in China from 1849 to 1851 in the suppression of piracy. He took part in the Burmese war of 1852, and went with an expedition to the Arctic regions in 1854; in the following year he served in the Baltic campaign. In 1868-70 he commanded the *Dryad* in the East Indies in the suppression of the slave trade; two subsequent commands were the *Audacious* in China in 1874-77 and the *Thunderer* in the Mediterranean in 1880-81. From the last-named year to 1884 Colomb was captain of the steam reserve at Portsmouth and flag-captain at Portsmouth during the next two years. In 1886 he was retired for age.

Besides being a high authority on naval evolutions, Colomb was the inventor of a number of appliances and details now deemed indispensable in war ships. In 1859 he introduced a system of signals in the army, and he devised the system of flash signals adopted by the navy in 1867. The latter system, generally called the Morse system because of its notation, is now said to be in universal use. In 1865 he presented to the navy plans for a system of steam tactics, which were adopted and have ever since been used. In 1873 he invented a system of interior lighting for warships, now used as an alternative for electric light. For many years Colomb worked for an amendment to the rules for preventing collisions at sea; to this end he wrote a number of pamphlets and books, including *Our Peril Afloat*, 1879, and *Danger of the Modern Rule of the Road at Sea*, 1885; his measure met with success at the Washington Maritime Conference of 1889. He was president of various departmental committees, including those on invasions, fouling of ships' bottoms, machine guns, and victualling stores. At the time of his death he was nautical assessor to the House of Lords. Among Colomb's publications, besides those named above, are: *Slave-Catching in the Indian Ocean*, 1873; *The Manual of Fleet Evolutions*, 1874, which system of tactics is official; *Fifteen Years of Naval Retirement*, 1886; *Naval Warfare*, 1891; *Essays on Naval Defence*, 1893; *The Naval War Game*; *The Collision Diagram*, 1896; *Memoirs of Admiral Sir A. Cooper Key*, 1898.

COLOMBIA, the most northwestern republic of South America, is bounded on the north by the Caribbean Sea and Venezuela, on the east by Venezuela and Brazil, on the south by Peru and Ecuador, and on the west by Ecuador and the Pacific Ocean. The capital is Bogotá.

Area and Population.—Colombia comprises nine departments, having a total estimated area of 513,938 square miles, of which about one-third are south of the equator. The official estimate of 1881 placed the population at 3,878,600; according to the estimate of 1895, the inhabitants number about 4,000,000, including 150,000 Indians. The largest department and also the most sparsely inhabited is Cauca; area, 257,462 square miles, population about 2.4 a square mile. The provinces most densely inhabited by the square mile are Santander, about 35, Antioquia and Boyacá, each 21, Tolima, 17, and Bolivar, 13. The principal cities are as follows, the populations given being probably somewhat too small, as figures for 1899 are not obtainable: Bogotá, 120,000 (according to a census taken in 1899 the population was only 80,000); Barranquilla, 40,000, a commercial town on the Magdalena River, twenty miles from the coast, connected therewith by rail; Medellín, 40,000, also a commercial town and situated in a mining district; Panamá, 30,000, and Cartagena, 20,000, ports on the

Pacific and Atlantic coasts respectively; Bucaramanga, 20,000, capital of Santander and an important coffee centre; Ibagué, 12,000, capital of Tolima; Popayan, 10,000, capital of Cauca; Cúcuta, 10,000. The president of France has been asked to arbitrate boundary disputes between Colombia and Costa Rica.

Government.—By the constitution, dating from August, 1886, the chief executive authority is vested in a president, who is chosen for a term of six years by electoral colleges, and is officially assisted by a cabinet of eight members, responsible to the congress and representing the departments of foreign affairs, the interior, finance, public instruction, war, and the treasury. The president in 1899 was Señor M. A. Sanclemente. The legislative power devolves upon a congress of two houses—the senate and the house of representatives; the former is composed of 27 members, each department delegating three senators, and the latter of 66 members, elected by popular vote, the nominal ratio of representation being one member for each 50,000 inhabitants. The departments, which were formerly sovereign states, retain some of their former prerogatives, including matters of finance; they are administered by governors, who are appointed by the president, and who hold office during his pleasure.

Army and Navy.—At each session of congress the strength of the regular army is determined, but in the event of war the president may call for the mobilization of such forces as are necessary, all able-bodied citizens being liable to military service. The number in the regular establishment in 1898 was placed at 1000. Colombia is practically without a navy, the government having only three small vessels, one of which is a river gunboat.

Finance.—The principal source of revenue is customs duties, and the chief items of expenditure are war, public works, justice, payment on public debt, and finance. The revenue and expenditure for the two-year period, 1897-98, were officially estimated in pesos at 34,361,000 and 35,771,013, respectively; for the two-year period, 1899-1900, the estimate was: Revenue, 34,305,000 pesos, and expenditure, 34,000,000 pesos.

Customs receipts have been: 1895, 10,750,889 pesos; 1896, 13,697,823 pesos; 1897, 13,256,353 pesos; these figures are exclusive of the duties on postal parcels, which for the three years amounted to 96,837 pesos, 221,416 pesos, and 280,947 pesos, respectively.

The total internal public debt on June 30, 1896, was 7,525,156 pesos; in addition, the government was responsible for a paper currency amounting to 30,862,352 pesos. In the same year the external debt, due largely to British creditors, was, including arrears, £3,514,442 (\$17,101,275). Subsequently (January, 1897), the government and the bondholders agreed upon a mode of settlement, and new bonds were issued for £2,700,000 (\$13,138,200). The coinage of the country is almost limited to small silver pieces, minted for the government in Europe; in 1896 this amounted to about 3,000,000 pesos. The value of the peso in United States currency on October 1, 1899, was \$0.436.

By an executive decree of August 18, 1899, the government announced its desire to negotiate a foreign loan of £3,000,000 (\$14,598,000) for the purpose of converting Colombian paper into silver currency. As pledges for the loan the government offered "the rental of the emerald mines of Muza and Coscuez, the product of the match monopoly, the annual sums due from the Panama Railroad Company to the republic, and the interest of the republic in the Panama Canal." The condition of public finance in 1899 was very unsatisfactory, and was said to be a principal cause of the insurrection which broke out in the autumn. This is treated in a succeeding paragraph.

Industries.—Mining is the most important industry of the republic. Agriculture ranks second, but as yet is little developed, only a small part of the tillable soil being under cultivation; the country is admirably adapted for many tropical products, but agricultural development is retarded by difficulties of transportation. Manufactures are almost unknown; there are iron works, however, at Pradera, northeast of Bogotá. The principal crop is coffee, the cultivation of which for the last few years is said to have been on the increase, though in 1897 the export fell off considerably. Other products are cacao, sugar, tobacco, cabinet and dye woods, vegetable ivory, fruits, rubber, wheat, maize, vanilla, indigo, and medicinal plants. The rubber product is obtained entirely from wild trees. There are large grazing districts, especially in the department of Tolima.

The mineral wealth of Colombia is very great. The most important metal mined is gold; other minerals found are silver, copper, mercury, lead, platinum, iron, manganese, emeralds, cinnabar, coal, petroleum, and salt. Gold exists in all of the departments, but is taken most successfully in Antioquia, where there are about 3400 gold mines, and in the region of Darien. There are many silver mines in Tolima and Cauca, in which departments the whole number of mines is about 700 and 575, respectively. For the exploitation of emeralds there have been reported 32 mines; this industry is carried on chiefly in the region of Muza, on the Minero

River, and the value of the annual output from that place is said to be nearly \$100,000. The government has a monopoly of the salt mines at Zipaquirá, north of Bogotá, and receives therefrom large revenues. It was announced in July, 1899, that the government had granted a concession for working the deposits of sea salt in the department of Panama, on condition that a duty of 37.9 cents (Colombian currency) be paid to the national treasury for each 12½ kilograms (27.56 pounds) of salt taken out.

Commerce and Shipping.—The chief imports include foodstuffs and liquors, textiles, and iron and steel goods; among the leading exports are coffee, cacao, silver, cotton, live animals and hides, cabinet and dye woods, tobacco, and rubber. Of all the imports about three-fifths enter through Barranquilla and one-fifth through Cartagena. The foremost country in Colombia's foreign trade is Great Britain. The value in pesos of the imports and exports has been as follows:

	1895.	1896.	1897.	1898.
Imports.....	11,528,365	16,947,135	18,136,598	11,346,028
Exports.....	15,088,406	18,597,352	16,820,411	19,735,733

The coffee exports for three years have been: 1895, 21,504,657 kilos, value, 8,504,312 pesos; 1896, 28,521,410 kilos, 10,474,752 pesos; 1897, 17,564,103 kilos, 8,799,129 pesos.

Colon and Panama are free ports and their transit trade, which in value is more important than the direct commerce of the country, is not included in Colombia's trade statistics. The freight carried in the fiscal year 1896-97 from Panama to Colon was: For Europe, 69,637 tons; for New York, 40,290. From Colon to Panama: From Europe, 77,553; from New York, 53,564. The local freight in both directions amounted to 34,013 tons. One steamer of 457 tons and seven sailing vessels of 1770 tons comprised the merchant marine in 1896. In the same year there entered at the customs ports of the republic 2074 vessels of 910,764 tons, and cleared 2061 vessels of 867,130 tons; the arrivals in 1897 were 1891 vessels of 858,457 tons, and the clearances 1850 vessels of 800,710 tons.

Communications.—The roads of the country are in a very primitive condition, being for the most part merely paths or mule tracks. The government, however, has taken measures to improve some of the more important routes. It was reported in 1899 that the total length of railways open for traffic is 663 kilometres (412 miles); in addition, there are about 270 miles unfinished.

There touch at the Colombian ports each month 33 regular steamers, of which 15 are British and 9 American. The length of telegraph lines in 1894 was 6835 miles, and the number of offices, 319.

Religion and Education.—The state religion is Roman Catholic, but religious toleration exists to some extent. Primary education is free, but not obligatory. In 1894 the primary schools numbered 1817, with an attendance of about 89,000 pupils; in the same year there were 15 normal schools, with an enrolment of about 600. For secondary education there have been reported various private and 34 public institutes. There are 4 colleges under departmental government control, with about 1100 students. A national university, comprising collegiate and technical schools, has about 1600 students.

The Panama Strike.—In the second week in January, 1899, a strike over a question of wages began among the dock and railway employees at Colon. It was taken up at Panama and was augmented by the sailors and firemen of the Pacific Mail steamers and the Pacific Steam Navigation Company. Business was necessarily suspended, freight amounting to 1000 tons lying at Panama and ships being obliged to leave port without changing their cargoes. After the strike had lasted five weeks, the railway and steamship agents accepted the terms demanded by the strikers—\$2.20 a day in Colombian currency—and the lockout came to an end on the 16th of February. During the strike there was some rioting, but it was not attended with serious results.

Arbitration Award.—On October 27, 1899, after two and one-half years of consideration, the Anglo-Colombian Court of Arbitration rendered its decision at Lausanne, Switzerland, in the dispute concerning the Medellín-Magdalena River Railway between the Colombian government and the engineering firm of Punchard, McTaggart, Lowther and Company, London. Colombia's claim of some \$20,000,000 was dismissed and an award of over \$200,000 was made in favor of the English firm. The tribunal also declared that Colombia should pay the award within six months, and that it should also pay 60 per cent. of the cost of arbitration.

Insurrection.—In the fall of 1899 a revolutionary movement developed in Colombia. The cause for dissatisfaction seemed to be the financial confusion brought about by the great quantities of paper money issued by the government, while at the same time the foreign bonds were in dispute. Little that was absolutely definite or

authentic was reported concerning the revolution, which was still in progress at the close of the year. The disaffection did not spread to any great degree to the northern districts of the republic. The most severe conflict seems to have been a naval battle on the Magdalena River, near the town of Puerto Nacional, in which the insurgents suffered the more severely. Toward the end of October the insurrection was reported to be confined to the departments of Santander and Bolivar; in the latter state the insurgents were said to have suffered defeat on November 9, and varying reports were made concerning the progress of the rebellion. The government took active measures for its repression, but at the close of the year it was believed that the insurgent cause was progressing. Industry and commerce, it was announced in December, were almost paralyzed.

COLONIAL DAMES OF AMERICA, organized in 1890, with patriotic and educational aims, has a large number of members and subordinate branches in many States. President, Mrs. John Lyon Gardiner; secretary, Mrs. T. M. Cheesman, 109 University Place, New York City.

COLONIAL DAMES OF AMERICA, NATIONAL SOCIETY OF THE, organized in 1890, is distinct from the foregoing, had in 1899 a membership of nearly 27,000. President, Mrs. Justine Van Rensselaer Townsend; secretary, Mrs. William Reed, 103 Monument Street, W., Baltimore, Md.

COLONIAL WARS, SOCIETY OF, founded in 1892, to perpetuate the memory of the events and persons connected with the wars of the American colonies. Governor-general, Frederic J. de Peyster; secretary-general, Walter L. Suydam, 45 William Street, New York City.

COLONIES. Questions arising out of the relations between the United States and its newly acquired lands led to much discussion of colonies and colonial policies in 1899. Specific facts in regard to the chief colonies in the world will be found in the separate articles on the colonies, dependencies, and protectorates, and for a record of the events of the year which bear on the colonial relations of the United States see the articles **UNITED STATES** (paragraphs on History), **CUBA**, **HAWAII**, **PHILIPPINES**, and **PUERTO RICO**. The present article is concerned only with general matters which came up in the course of discussion. Early in 1899 the bureau of statistics of the United States Treasury Department issued a monograph on the *Colonial Systems of the World*, which, after a general account of the systems employed by the chief colonizing nations, gave a detailed account of each colony under its own title, and presented tables showing the area, population, form of government, and commerce of all the colonies, dependencies, and protectorates.

Colonial Systems.—The colonial systems of the world may be roughly divided into, first, those which are based on the principle that the colony is to be exploited for the benefit of the mother country, and, second, those which regard the administration of the colonies as a sort of trust to be executed for the benefit of the natives. An illustration of the former is afforded by the colonial system of the Netherlands, and especially by the Dutch administration of Java, where the inhabitants, numbering some 25,000,000, are governed by a handful of Europeans. This "culture system," as it is called, was introduced about seventy years ago. The essential point in it was that the island was regarded as a huge farm which was to be worked for the profits of the rulers. After it was placed in good working order it yielded an annual surplus to the home government, but, in the course of time, the returns fell off and the system is now regarded with less favor. One feature of it, however, has met with success—that is, the practice of employing native functionaries to co-operate with the ruling class in the administration of the laws. (See **JAVA**.) The best illustration of the other colonial policy, which regards the work of the governing class as a trust for the benefit of the natives, is afforded by the colonial system of Great Britain. In general, Great Britain's policy has been to render her dependencies self-governing wherever it was possible. Those colonies whose inhabitants have shown a capacity for administering their own affairs have obtained the right of doing so, and even where this has not been done the governing class has, on the whole, shown due regard for the interests of the natives. It is a flexible system and admits of great variety. The governors are always appointed by the crown, but the law-making power is left with the people when their political capacity has seemed to justify it. In some cases all the members of the legislative bodies are elected by the people; in others a part are elected and a part appointed by the home government, and in still others the appointments are divided between the home government and local trade and municipal organizations, the home government always retaining the veto power. The British colonies may be grouped in three classes: First, crown colonies, which are wholly under the control of the home government; second, representative colonies in which the home government, while retaining a veto on legislation and the control of public offices, leaves the law-making to colonial legislative bodies; and, third, colonies with responsible govern-

ments, in which the crown's authority is limited practically to the appointment of a governor and to the veto power as to colonial legislation, leaving the law-making function and the control over public offices in the hands of the local population. In the discussion of the colonial problem during the year there was substantial agreement upon this one point, that the British system offered a far better model than that of any other country with large colonial possessions. In the French colonies far less legislative power is left with the local population, although the more important colonies, such as Algeria, are directly represented in the French legislature. Many French writers themselves have expressed dissatisfaction with the working of their own system. M. Hanotaux and M. Leroy-Beaulieu, for example, have pronounced it a failure, the latter complaining especially of the practice of choosing the colonial officials from the home administration and of regarding their colonial work as a mere step in the line of their promotion. The German colonial system is said also to err on the side of an excessive officialism—that is, too rigid adherence to bureaucratic methods. Great Britain's policy seems finally to have broken completely with the idea of using her colonies as a direct source of pecuniary gain. The question then arises: What advantage comes to the mother country by colonial expansion? This advantage is wholly indirect. It has been defined by some as consisting in the ability which it affords to the energy and enterprise of the inhabitants of the home country and in the fostering of trade.

The number of colonies, protectorates, and dependencies of the world has been placed at 125, their area at two-fifths of the world's surface, and their population at one-third of the world's inhabitants. They are for the most part centred in the torrid zone. The bureau of statistics places the average annual imports of the colonies and protectorates at more than \$1,500,000,000, and estimates that 40 per cent. of this consists of purchases from the home countries. The exports have an even higher value, and 40 per cent. of them are also said to be sent to the home countries. As to trade policies it would seem that the commerce between the most successful colonies and their mother countries has been placed on practically the same footing as that with other countries; and in the case of Great Britain, at least, the trade with some of her most progressive colonies, while increasing absolutely, forms a smaller proportional share of the total commerce of these colonies as time goes on. It is estimated, for example, that, while the British colonies of North America purchased 50 per cent. of their imports from the United Kingdom in 1871, they obtained only 30 per cent. from that source in 1896, and there was a corresponding decline in the relative importance of the home trade in the case of the South African and Australian colonies.

Europeans in the Tropics.—The question of acclimatization has become very prominent in connection with the movement toward colonial expansion. It is the conclusion of Mr. Kidd in his *Control of the Tropics* that the white race cannot flourish in tropical regions, and he has supported this view by a mass of evidence. Others maintain that a comparatively short period of residence will suffice for the acclimatization of the white man in tropical lands if he takes proper sanitary precautions. Apart from the purely physiological aspect of the question there are many difficulties in the way of the successful administration of tropical dependencies. The inhabitants of tropical countries maintain a different attitude toward the government from that of the natives of temperate regions. Tropical races are more indifferent toward governmental aims and less inclined to progress. The invincible idleness of the people, which has been bred by the extreme ease of securing a livelihood, invariably discourages the new administrator. The non-tropical colonies of Great Britain show marked differences from the tropical in the value of their trade. It has been estimated that while such colonies as Australia, Canada, and Newfoundland import British produce to the value of \$15 per head of their population, the tropical colonies import only 56 cents' worth. Some writers argue that natives of the tropics will never become capable of self-government in the sense in which the Anglo-Saxon uses the term; and they hold it is wrong to assume that administrative capacity is the necessary accompaniment of intellectual attainments in other fields. At the present time there is great divergence of opinion on this point, and it is well illustrated in the case of India, where one group of writers believe in the principle of "India for the Indians," while another, though admitting the intellectual capacity of the Hindoos, and even their superiority to white races in respect to a certain subtlety of mind, deny completely their administrative capacity or their ability to deal efficiently with practical affairs. The important outcome of this branch of the discussion is the general belief that whatever may be the ultimate results of political discipline, the tropical races require a far more paternal form of government than advanced communities in the temperate zone would willingly endure. The British government of India has been taken by some as an instructive type of white government in the tropics and as affording, in respect to some of its features, a possible model for the United States in its administration of the Philip-

pires. Among the characteristics of the Indian government which have found especial favor with students of colonial affairs the following may be noticed: The governing class in India has pursued a policy of indifferentism in regard to the native religions, neither favoring one at the expense of the other, nor trying to force the religion of the rulers upon the subject race. Again, the Indian administration has profited by the high standard set for entrance into the Indian civil service. This has resulted in the development of a select class of trained officials which has been recruited from the very best element in the population of the United Kingdom. The civil service, has, in fact, offered an honorable career, with prospects of great advancement, to men of administrative talent and energy, and, in spite of its many defects, it has brought into existence a class that have proved their fitness for the business of governing a dependent race. The form of government is as follows: At the head is the secretary of state for India, who governs with the assistance of a council and resides at London. On Indian soil the chief executive is the viceroy, or governor-general, who is also assisted by an executive council which consists of the heads of the departments. This council constitutes a legislative body when to it are added the governor of the province in which it is held, the official delegates from Madras and Bombay, and certain unofficial representatives of European and native communities. Below the chief executive for all India are the governors of each of the two presidencies, with their councils, the lieutenant-governors of Bengal, the Northwestern Provinces, and the Punjab, and the chief commissioners of the other provinces. Below these come the collector magistrates or deputy commissioners of the 238 districts. Each province has its own judicial system under the high court. The derivation of authority is from above. It is a paternal system, not constitutional and representative. Its effectiveness is a matter of debate, but the benefits that have been claimed as resulting from it are the maintenance of peace and order, the building of extensive public works, the fair administration of justice, the simplification of the taxes, the mitigation of plagues and famine, the free development of trade, and the bringing of justice within the reach of all. For further details of the administration see the article INDIA.

Colonial Problems of the United States.—The discussion of the colonial question in the United States followed the same lines as in the previous year—that is, it was concerned first with general matters of colonial policy, including such things as the proper form of government to be established, the peculiar needs of each dependency, and the difficulties in the way of a satisfactory administration; second, the constitutional question—that is, the extent to which the constitution places limitations upon the conduct of the United States toward its dependent territories. In the article on the United States and in the separate articles on Cuba, Hawaii, the Philippines, and Puerto Rico will be found an account of specific matters connected with the relations of the United States to these dependencies. The present article aims only to present some of the most striking points in the general discussion. As to the general question of colonial policy, it should be noted at the outset that the acquisition of the new territories present very different problems. The least difficult of these problems is presented by Hawaii, where the Anglo-Saxon race has been established for many years, and where Anglo-Saxon institutions may, it is thought, be introduced without difficulty. Still the matter is complicated by the presence in Hawaii of a large number of subjects of foreign states. In Cuba the main difficulty consists in the presence there of a large Spanish element in the population, and in the eagerness on the part of the Cubans for immediate independence. But the main problems are concerned with Puerto Rico and the Philippines. There are peculiar difficulties in the administration of each of these dependencies. Puerto Rico is a subtropical colony inhabited by a European race, and the chief task will be the reconciliation of this race to a change of rulers and the training of it in forms of government that are peculiar to an Anglo-Saxon civilization. The Philippines, on the other hand, are a tropical country inhabited by Asiatics. Of these Mr. Bryce says: "Probably no task has been presented to the English in India or in any of their colonies during the last fifty years so difficult as that to which Americans will have to address themselves when they become responsible for these islands."

Puerto Rico.—There is great difference of opinion as to what should be the proper form of government for Puerto Rico—whether it should be a protectorate of the United States, or an unorganized territory, or a territory organized in the regular way until ready for statehood; how long military rule should be retained, to what extent natives should be represented in the legislature, and how far the United States system of government should be grafted upon the present system. In regard to the most obvious solution of the problem—namely, the establishment of a territorial form of government as a preparation for statehood—it has been said that the ordinary criterion for admission of a territory as a State will fail in this case. Puerto Rico already has sufficient population to entitle it to statehood; yet its admission must be deferred until it receives a proper training in self-government. In the mean-

while some method of colonial government must be adopted. Of the methods employed by the colonizing nations, the system of a governor appointed by the home government and a legislature chosen by the colony has been proposed by some, but is open to the objection that it promotes friction between the colonial and home governments, and the experience of England with her North American colonies is offered as an illustration of its bad results. It has been the policy of England to introduce a responsible form of government as soon as the colonies were fit for it. In her West Indian colonies there is a legislative council, partly elected and partly chosen, and the governor bears the same relation to it as the premier in the British government bears to Parliament. The introduction of responsible government in Puerto Rico would, however, be unsafe until the people had been trained in political affairs. If Puerto Rico remains a dependency and not a protectorate one of two forms of government may be established: Either an assembly chosen from the people and having strict limitations placed upon its powers, leaving other affairs to the governor and his appointed council, or a legislative body made up partly of appointed and partly of elected members may be made the basis of the system. The latter course has been advocated as better adapted to a people unfamiliar with constitutional government. As to the local government, it has been urged that it should aim to foster the participation of the natives in political affairs and to accustom them to manage their own business. A qualification of the franchise in such a way as would make it naturally extend as the colony advanced in education and prosperity has also been advocated, and another essential point is the establishment of a permanent civil service which should be, so far as possible, recruited from native Puerto Ricans. Mr. Abbott L. Lowell, the author of *Essays on Government*, refers to the judicial system as presenting the most important question of all. It does not seem to him that the common law should take the place of the present system, but the courts should be organized on the American basis and the people should be thoroughly familiarized with American judicial conceptions. To change the law of the land to the extent of replacing the civil law, which now obtains there, by the common law, seems to him oppressive. He advocates the administering of the civil law by means of the American judicial system. Some writers take a very favorable view of the capacity of the Puerto Ricans for self-government, and favor the earliest possible establishment of a native legislature and an administrative system carried on by native officials. There has been a fear that the military rule might be too prolonged, and that the placing of too many Americans in the government might lead to the evils of carpet-bag rule.

Philippines.—Here the problem of colonial rule is very different, since the white men must always bear such an insignificant proportion to the Asiatic natives. On the general principle which should underlie the governmental system for the islands there is substantial agreement. It is conceded, for example, that religious toleration should be practised toward Christians and Mohammedans alike, that a certain degree of paternalism in the government is necessary, that the revenues should be spent upon the country, and that efforts should be made to give the natives a share in the government and fit them for managing their own affairs. England's attitude toward the native states of India and of the Malay Peninsula is often cited as affording a good precedent for our policy in the Philippines. The English have learned by experience the wisdom of preserving in India every native state, subject to certain limitations in the matter of succession to the throne, the native military force, the taking of white men into the service, and the requirement that the prince shall admit to his dominions a British resident who will watch the administration and will give advice. To what extent the existing authority of chiefs could be utilized in this manner in the Philippines is to be learned by experience. The good effects of such a system are that they remove to some extent the responsibility from the governing nation and prevent discontent by permitting native rule. The status of foreigners in the Philippines presents a difficulty if the military rule be continued as some advise. The denial to these foreigners of civil rights would place the United States in an embarrassing situation, especially when these rights are guaranteed to them by treaty with their own country. The immigration of the Chinese threatens to bring about the same results as in the Straits Settlements, where their greater aptitude for business has resulted in placing them in control of the larger part of the smaller trade of the country and ousting the natives who feel toward them a bitterness which is augmented by the difference in race and customs. Among other warnings which have been given by students of this matter is that an undue regard for party politics in the appointment of colonial officials in the Philippines will bring disaster. A thorough knowledge of the native character and a just and consistent policy in the administration are the first requirements of our policy. It is urged that native functionaries be associated with American officials in the administration, that the civil service take on a distinct and permanent character, as in the case of the Indian civil service, and that of Holland's colonies. The

governor should be aided by an advisory council of officials and should be allowed a large measure of discretion in all matters not affecting the outside relations of the colony. Minor offices and magistracies should be filled by the natives, and native troops should be employed under American officers. These and the many other suggestions on the subject look to a strong and paternal form of government in which no attempt would be made to force a constitutional representative system upon people who were unfit for it. One writer goes so far as to say that "we need to place a benevolent despot in every district in the Archipelago," but, while there is substantial agreement as to the broad principle of the policy of the United States toward the Philippines, there is, as in the case of Puerto Rico, a wide divergence as to the political status of the islands and the restrictions imposed upon their government by the constitution.

Constitutional Question.—The main question is: Does the constitution of the United States extend of its own force to territories and dependencies of the United States? The reasons for an affirmative answer have been briefly summarized in an article by Professor T. S. Woolsey, of which some of the main points are as follows: The moment the Congress of the United States begins to legislate for the Philippines constitutional guarantees apply. These guarantees relate to security of life, liberty, and property, and are contained in the body of the constitution and its amendments. They may be comprised under the heads of citizenship, justice, revenue, bankruptcy acts, military forces, titles of nobility, freedom of opinion and speech, and slavery; or, to state some of the chief guarantees more specifically: religious freedom, freedom of speech and press, right of assembly and petition, right to bear arms, security from search and seizure, and from quartering troops, right of trial by jury, and other judicial securities. Of the guarantees which undoubtedly extend to all United States territory the most important is the right of trial by jury, in regard to which the constitution says that the "trial of all crimes, except in cases of impeachment, shall be by jury and such trials shall be held in the State where the said crime shall have been committed, but, when not committed within any State, the trial shall be held at such place or places as the Congress may by law have directed." It would follow from this clause and from its enforcement by judicial decisions that no conviction for crime could be had in any of our new possessions after the establishment in them of civil government, except upon trial by jury. And the same thing would apply to the guarantees against slavery in the United States or in any place subject to its jurisdiction; the provision for religious liberty, for indictment by grand jury in the case of an infamous crime, for the prohibition of cruel or unusual punishments, etc. Since the establishment of civil government would necessarily introduce these guarantees, the only alternative is to continue military rule, for the character of the natives is such as to render any form of government based on these principles impracticable. They have been described as incapable of gratitude, profligate, untrustworthy, improvident, treacherous, and superstitious, though these qualities are accompanied with such inconsistent traits as cleanliness, sobriety, and patience. A government that would be bound to admit trial by jury or the right of assembly, or the right to bear arms would be of short duration. The military system is sufficient. So long as Congress remains inactive the duty of making the internal rules and regulations for the administration of the territory rests with the executive. It permits the despotic form of administration which is after all best adapted to the needs of the islanders. The same powers would be intrusted to the President as were conferred upon him by the first act relating to Louisiana in 1803.

The opposing view rests on the assumption that the term United States as used in the constitution has a double meaning, sometimes referring to the States collectively, and sometimes to the sovereign power resident in the union of the States. It is held that the constitution of the United States does not extend beyond the limits of the States, which are united by and under it. It is only the thirteenth amendment, prohibiting slavery, that applies to any place subject to its jurisdiction. The others relate only to the States and the people of the States, and it is expressly stated in the constitution that "Congress shall have power to dispose of and make all needful rules and regulations respecting the territory or other property belonging to the United States" (Article 4, section 3). It is admitted that certain *dicta* of the Supreme Court make against this view, but it is held that mere expressions of opinion on the part of judges will not be allowed to control subsequent decisions. The general line of the argument may be sufficiently indicated by the discussion of the restrictions imposed by the constitution in the matter of citizenship, trial by jury, and revenue. Amendment XIV. prescribes that "all persons born or naturalized in the United States and subject to the jurisdiction thereof are citizens of the United States and of the State wherein they reside"; and Amendment XV. that "the right of citizens of the United States to vote shall not be denied or abridged by the United States or by any State on account of race, color, or previous condition of servitude." If these are effective, every child born in the Philippines and Puerto Rico after

the treaty went into effect is a citizen of the United States. This assumes that as a result of the treaty the Philippines and Puerto Rico became parts of the United States, but this is not the case if the United States means here the States united under the constitution. This is the meaning taken by those who believe that the constitution does not of its own force apply to the new lands. On this assumption birth in Puerto Rico and the Philippines would not bring citizenship, because a person born outside the United States in this sense has a status not defined by the constitution. Congress may define this status as it chooses. The legislative and the treaty-making powers may grant citizenship. In all treaties of cession before that ceding Puerto Rico and the Philippines citizenship was in fact established by the treaties themselves. The power that can grant can also withhold. The courts have never decided that a person born in a territory is a citizen of the United States in the meaning of the amendments. As to the judicial power, the Supreme Court has decided that Congress may establish in the territories such courts as it pleases. The guarantee of jury trials does not apply to these territorial courts, whose procedure may be fixed by legislation just as they may be created by legislation. Only the courts created by the constitution are subject to constitutional limitations. Against this there are several *dicta* of the Supreme Court, and in one case it was decided that a citizen of the District of Columbia had a constitutional right to a jury trial and in another the court stated that the provisions of the constitution in regard to jury trials applied to territories.

As to revenue, Article I. declares that "all duties, imposts, and excises shall be uniform throughout the United States." Here, as in the case of citizenship, the matter hinges on the meaning of the term United States. Those who oppose the doctrine that the constitutional restrictions apply to dependent territories hold that the term United States as used in this article means the States united under the constitution. The taxing power over such territories rests on the general grant to Congress of the right to make all needful rules and regulations for the government of the territories. (Article IV.) See ECONOMIC ASSOCIATION, AMERICAN.

COLORADO, a Western State of the United States, has a land area of 103,645 square miles. The capital is Denver. Colorado was admitted to the Union August 1, 1876.

Agriculture.—The following shows the production and value of the principal crops in the calendar year 1899: Corn, 2,911,488 bushels, \$1,251,940; wheat, 7,337,781, \$4,182,535; oats, 2,448,846, \$1,028,515; barley, 337,932, \$185,863; rye, 33,236, \$15,953; potatoes, 2,713,536, \$1,492,445; and hay, 1,630,274 tons, \$11,982,514. Live stock, January 1, 1900, comprised, horses, 145,713, \$4,068,081; mules, 8,580, \$399,827; milch cows, 93,499, \$3,384,664; other cattle, 1,021,922, \$28,297,538; and sheep, 2,185,327, \$6,250,036.

Industries.—The progress of an exceptionally good year in general mining interests was briefly interrupted by the operation of an eight-hour day law passed by the legislature on March 16. The law was made applicable to all mines and smelters, and went into effect on June 15. Before that date the unions of operatives affected by the new law made a demand for ten hours' pay for the proposed eight-hour day, and as this demand was refused, a general strike of miners and smelters was declared. For a month the situation grew worse daily. On July 17 the Supreme Court of the State handed down a decision declaring unanimously that the new law was unconstitutional. Under this decision the strikes, which had become reduced to one of the smelters only, were declared off early in August. In nearly all of the principal mines the eight-hour day was adopted, and the scale of wages readjusted amicably between the miners and the operators. One of the first effects of the calling off of the strike was the release of several thousand carloads of ore for shipment to the smelters. The State's output of all grades of gold ore showed a falling off of about \$500,000 per week during the six weeks of the strike.

The enlargement and extraordinary production of the Cripple Creek gold camp and the unexpected development of a new boom in the Leadville district are the most prominent features of the year's record. The December showing of Cripple Creek dividend payers was the greatest in the camp's history. The total output of the mines up to November 7 was \$15,000,000, and the new mining from that date to the close of the year, added to the surplus ore then piled up at the mills for reduction, was expected to bring the year's record close to \$20,000,000, an increase of 25 per cent. over 1898. At the end of the year, while complete results were still unreported, the indications were that every mining camp in the State would show an increased output. The production had reached a point where railroads, reduction mills, and smelters were totally unable to handle the tonnage offered. The United States branch mint at Denver reported the receipts of gold amounting to \$21,144,287 in the fiscal year ending June 30, 1899, against \$16,240,441 in the previous fiscal year, and of this total 97 per cent. was from Colorado mines.

The great appreciation of the Cripple Creek properties started Denver and Colorado Springs in a race for the control of trade there, and the railroad systems of both cities were rapidly extended to the great camp in the closing months of the year. Colorado Springs also became a rival of Denver in the handling of mining stocks, an exchange being opened there in September to take the overflow from the Denver board, which has been working to its full limit for several months. The final estimate of the director of the mint on the production of gold and silver in the United States in the calendar year 1898 credited Colorado with \$23,195,300 in gold and a silver output of 22,815,600 fine ounces, of a commercial value of \$13,460,204. The output of coal was 4,076,347 short tons, valued at \$4,686,081, an increase of 714,644 tons in a year; iron ore, 318,480 long tons; pig iron, 91,222 long tons; all kinds of rolled iron and steel, 99,050 long tons, and of quarry products, granite, sandstone, and limestone to the value of \$224,870.

Banks.—On October 31, 1899, there were 36 national banks in operation and 29 in liquidation. The active capital aggregated \$4,147,000; circulation, \$1,901,782; deposits, \$45,246,491; and reserve, \$21,370,053. The State banks, July 3, 1899, numbered 28, and had capital, \$1,315,000; deposits, \$6,453,987; and resources, \$7,934,426; and private banks, 7, with capital, \$90,026; deposits, \$171,403, and resources, \$296,268. The exchanges at the United States Clearing-house at Denver in the year ending September 30, 1899, aggregated \$165,276,506, an increase of \$24,467,014 in a year.

Education.—At the close of the school year 1897-98 the school population was 135,007; enrolment in public schools, 104,723; and average daily attendance, 69,973. There were 2982 teachers, 1704 buildings used as school-houses, and public school property valued at \$5,987,703. The revenue was \$3,004,587; expenditure, \$2,341,311, of which \$1,473,276 was for teachers' salaries. There were 39 public high schools, with 208 teachers and 4928 secondary students; 63 private secondary schools, with 293 teachers and 2238 secondary students and 6735 elementary pupils; a public normal school, with 16 teachers and 502 students in all departments, and a private one, with 9 teachers and 191 students. Normal training was also given in two colleges. Four colleges and universities for men and for both sexes reported 55 scholarships; 225 professors and instructors; 1417 students; 55,257 volumes in the libraries; \$69,100 invested in scientific apparatus, \$1,406,400 in grounds and buildings, and \$616,910 in productive funds, \$236,067 in total income; and \$67,075 in benefactions. In 1899 there were 318 periodicals, of which 39 were dailies, 246 weeklies, and 26 monthlies.

Railways.—During the calendar year 1898 the new railway construction amounted to 30.75 miles, giving the State a total mileage in 1899 of 4608.85. New steam and electrical construction in 1899, the latter connecting large mining camps, is estimated to have added at least 350 miles to the total length.

Finances.—The total assessed valuation on November 30, 1898, was \$192,243,080, a decrease in a year of \$5,756,920, and the tax rate was \$4.10 per \$1000, the same as in the previous year. The total debt, December 1, 1898, was \$3,877,042, and the treasury held assets of \$849,275, leaving the net debt \$2,728,667, an increase in a year of \$31,027.

Population.—As estimated by federal officials, the population on June 30, 1899, was about 527,000.

Opening the Ute Strip.—In accordance with the proclamation of the President, the Southern Ute Indian lands were opened to settlement at noon on May 4. The tract includes all the unallotted and unreserved lands within the former Ute reservation. The rush for homesteads was much greater than was expected; the town of Tabor was located at a point 40 miles south of Durango within an hour; and within a week more than a dozen villages were started, several hundred buildings were under construction, and the railroads were being extended through the section.

Legislation.—A constitutional amendment changing the method of adopting amendments to the constitution will be voted upon in 1900. A large amount was appropriated to sink artesian wells for irrigating and domestic purposes. A law was enacted providing that if one of two or more joint debtors is released by a creditor, the liability of the remainder is not affected. The provisions of the law concerning game and fish are most drastic. A State game and fish commission is to be appointed with extraordinary powers. License or consent must be obtained to keep wild animals or fish in private parks, or to import, store, or transport the same. In all civil cases three-fourths of the jury may render verdicts. The State is building roads by the direct appropriation of large amounts. Attendance at school was made compulsory. All wages must be paid in money, and store or "truck" orders were prohibited, and a very liberal mechanics' lien law was enacted. A State board of library commissioners was created, and cities may levy a tax for public libraries.

Municipal Elections.—The total vote cast for mayor in Denver showed a large majority in favor of municipal as distinguished from corporation control of public utilities. The Democratic and Independent platforms were almost identical, so far as the municipal ownership of water-works, lighting plants, and transit facilities was

concerned. The Silver Republican party was regarded as upholding corporations. A Democratic mayor, Mr. H. V. Johnson, was elected.

State Officers and National Representatives.—Governor, Charles S. Thomas; lieutenant-governor, Francis Carney; secretary of state, E. F. Beckwith; treasurer, John H. Fesler; auditor, George W. Temple; adjutant-general, J. C. Overmyer; attorney-general, D. M. Campbell; superintendent of education, Helen Grenfell. Supreme court: Chief justice, John Campbell; associate justices, Luther M. Goddard, William H. Gobbert; clerk, H. G. Clark. The state legislature consists of 30 Democrats, 8 Republicans, 29 Populists, and 33 Silverites. Senators: Edward O. Wolcott (Rep.), from Denver, and Henry M. Teller (I.), from Central City. Representatives: John F. Shafroth (Sil.), from Denver, and John C. Bell (Pop.), from Montrose.

COLORADO FORMATION. The rule adopted last year by the commission of foreign and American geologists of applying locality names to divisions of the fourth order is carried out in the following table, recently printed, in which Logan gives the following for the Colorado Formation:

	<i>Kansas Area.</i>	<i>Colorado Area.</i>	<i>Black Hills.</i>	<i>Iowa, Nebraska.</i>
Niobrara Series.	Pteranodon beds.	Apishapa beds.	Shale, lime.	Wanting.
	Fort Hays limestone.	Upper Timpas.	Limestone.	Chalk limestone.
Benton Series.	Shale group.	Carlisle shale.	Shale.	Wanting.
	Limestone group.	Greenhorn limestone.	Limestone.	
	Bituminous shale.	Graneros shale.	Shales.	Shales.

COLORADO STATE HISTORICAL AND NATURAL SOCIETY. See ANTHROPOLOGY IN AMERICA.

COLORED METHODISTS comprise the African Methodist Episcopal, the African Union Methodist Episcopal, the African Methodist Episcopal, Zion, and the Congregational Methodist Churches. These four bodies had in 1899 a total of 8238 ministers, 7548 churches, and 1,199,631 communicants, the first and third named being the most important. The thirtieth session of the general conference is to be held in Washington, D. C., May, 1900.

COLUMBIA, BRITISH, a province of the Dominion of Canada, with an estimated area of 383,300 square miles, exclusive of the territorial seas; capital, Victoria.

Mineralogy.—The production of the precious metals in the calendar year 1898 was: Gold, placer, \$643,346; lode, \$2,201,217; silver, \$2,375,841; copper, \$874,781, and lead, \$1,077,581. The output of coal was 1,135,865 tons, valued at \$3,407,595; coke, 35,000 tons, value, \$175,000; other mineral products, \$151,500, making the total value of the mineral production of the year, \$10,906,861. Gold from placer mines gradually decreased in output from \$3,913,503 in 1863 to \$643,346 in 1898. The discovery of gold in the Atlin Lake region has led to so many complications that both the Dominion and the provincial governments have been forced to take cognizance of the situation. At first the Atlin Lake gold fields were believed to be in the Northwest Territory; now they are declared to be in British Columbia. Many claims belonging to Americans were recorded by the gold commissioner as being in the Northwest Territory. The declaration that they are within British Columbia is a most serious matter for American miners, as the provincial government has passed a new mining law which prohibits the holding of claims by others than British subjects. Early in 1899 the Dominion government sent an agent to define the boundary between British Columbia and the Northwest Territory, as well as the lines of the Atlin mining district.

Fisheries.—The value of all fishery catches in the calendar year 1897 (the last officially reported) was \$6,138,865, an increase in a year of \$1,954,866. The principal catch was salmon, \$5,185,576; halibut, \$98,375, and herring, \$18,065; exports of all fisheries in 1898 amounted to \$3,846,946; the distribution of fry was 5,850,000, and the capital investment in all fisheries was \$2,514,660.

Commerce.—In the fiscal year ending June 30, 1898, the imports of merchandise aggregated in value, \$8,690,263, nearly all of which was entered for home consumption; exports, domestic and foreign, \$16,919,717, an increase in a year of \$2,902,149; duty collected, \$2,213,593. The registered tonnage of British, Canadian, and foreign vessels carrying cargoes in and out of the province was 2,360,853, and of all vessels in the coasting trade, 4,065,725. Navigation along the coast was facilitated by 24 light stations, 29 lighthouses, 5 fog-horns, and 6 fog-bells.

Banks.—In 1898 clearing-houses were established in Vancouver and Victoria. The Bank of British Columbia was operating seven branch banks, and there were 39 other chartered bank branches. There were also 31 post-office savings banks, with 2884 depositors and \$714,463 deposits, and one government savings bank, with 3437 depositors and \$1,048,829 deposits.

Railways and Telegraphs.—In 1898 the total length of railways was 892 miles, the construction of which had been aided by the provincial government to the extent of \$37,500, and of government telegraph lines, 567 miles, of which 394½ miles were operated by the Canadian Pacific Railway Company, the government paying the excess of expenditure over revenue.

Post-Offices.—At the end of 1898 there were 311 post-offices in the province, in which were posted during the year 6,700,000 letters and 525,000 postal-cards, and 79 money-order offices, which issued 90,674 orders.

Education.—In 1898 there were 228 common schools, with 241 teachers, 7177 enrolled pupils, and 4075 in average attendance; 29 graded schools, with 169 teachers, 10,012 enrolment, and 6704 attendance; and 4 high schools, with 12 teachers, 459 enrolment, and 276 attendance. The expenditures were \$290,255, of which \$168,599 was for teachers' salaries and \$42,499 on account of school-houses, furniture, and repairs. At the end of 1899 there were 37 periodicals, of which 10 were dailies and 22 weeklies.

Finances.—The revenue of the province in the year ending September 30, 1898, was \$1,439,623; expenditure, \$2,001,031; gross debt, \$7,425,262; Dominion government debt allowance, \$583,021; other assets, \$1,996,827; total assets, \$2,579,848; value of public buildings and grounds not included in assets, \$1,875,000; net debt, \$4,845,414.

Population.—Local estimates in 1898-99 gave Vancouver 25,000; Victoria, 24,000; New Westminster, 8750; Rossland, 7000, and Nelson, 4000. The Indian population of the province in 1898 was 24,973. There were 38 schools for Indian youth, which had an enrolment of 1550 and average attendance, 954. The Indians cultivated 13,645 acres of land, had 25,157 head of live stock, and received \$548,953 from their fish, furs, and other industries.

COLUMBIA UNIVERSITY, in New York City, was founded in 1754. During the absence of President Low, who was a delegate from the United States to the International Conference of Peace at The Hague, in May and June of 1899, Professor J. H. Van Amringe, dean of the Columbia College, was appointed by the trustees acting president of the university. The tenth annual report of President Low showed that on June 30, 1899, the net debt against the new site was approximately \$3,575,000, the annual interest upon that sum amounting to \$113,000, and that successful efforts to refund a large portion of the debt had resulted in a reduction of the annual interest charge against the new site by as much as \$37,000. The discharge in full by the president of the obligations entered into by him on account of the construction of the library still further reduced the debt by the sum of \$600,000, so that the annual interest charge against the entire net debt was approximately \$98,000. The site formerly occupied by the college at Forty-ninth Street and Madison Avenue was sold during the year to Dr. John S. White, the principal of Berkeley School. In co-operation with the Teachers' College, acting as a part of the university, arrangements were made for a summer school, to be maintained at the university, beginning with the summer of 1900. With the beginning of the academic year 1899-1900, the advanced work in botany was carried on in the laboratories of the New York Botanical Garden, arrangements having been completed during the year for the removal to the garden of the herbarium of the university and of the principal part of the botanical library. On July 1, 1899, Mr. George H. Baker retired from active service as librarian and became emeritus librarian on half salary; and James H. Canfield, LL.D., president of the Ohio State University, succeeded him as librarian. During the year 25,404 volumes were added to the library, 5141 volumes by gift. During the year the university received gifts for current uses, amounting to \$73,794.33, and for permanent endowment, amounting to \$490,417. During the year Mr. and Mrs. William D. Sloane transferred to the university the building erected, enlarged, and endowed by them, known as the Sloane Maternity Hospital. Completely furnished and equipped, it represents an expenditure of \$526,300, and is provided with an endowment amounting to \$373,300. CONGO FREE STATE. The constitution of the Congo Free State was recognized and defined by an international conference, held at Berlin in 1885, at which time certain foreign rights and privileges, such as free trade and internal navigation, were guaranteed to the principal nations. The sovereignty of the state having been established, that country was placed under the rule of Leopold II., King of Belgium, who had contributed generously to the exploration and opening of the Congo territory, and who had in 1883 founded the Congo International Association, the forerunner of the state. By a will, dated 1889, the King bequeathed to Belgium his sovereign rights in the state, and in 1890, by a treaty between Belgium and Congo, the former country was given the right to annex the state after a period of ten years.

This period ends during the year 1900. The Congo Free State has an area of about 900,000 square miles. Its estimated population is about 20,000,000, which includes about 1060 Belgian inhabitants and about 600 other Europeans.

Trade and Commerce.—Under the Belgian rule, established in consequence of the European conference at Berlin in 1885, the Congo state has, on the whole, prospered, and has immensely contributed also to the welfare of Belgium. The improvement of Belgian trade is shown by the statement of the United States consul-general at Antwerp that in 1885, at the time of the foundation of the Congo state, five European firms controlled the trade of the Congo River basin. There were almost no Belgian imports at the time, and no Belgian firm had established commercial relations in that region. In 1898, thirteen years later, the activity of the Belgians had created within that country twenty-four commercial companies, with a capital of about \$19,000,000. With commerce almost nothing in 1885, it amounted in 1897 to \$2,509,000 for exports from the Congo to Belgium, and to \$3,088,000 for imports from Belgium to the Congo. The feeling of uncertainty regarding the success of the "Congo affair" in 1885 had given way in 1899 to confidence, which was attested by the large investment of Belgian capital in the various important enterprises awaiting development in the Congo territory. The success of certain commercial companies and of the railroad undertaking have in particular drawn the attention of Belgian financiers to the value of the country to Belgium. At a recent celebration by the city of Antwerp of the progress of the Congo Free State the King outlined the future policy of the government concerning trade. He emphasized the recent commercial development in Africa, and pointed to the probability that the railway now finished and others to be constructed would increase Belgian-Congo commerce in an even greater ratio than in the past. The policy would be to imitate Germany in the formation of numerous export associations, and to encourage by all private and official means the establishment of trade centres in Africa. The King urged an increase in the number of plants and factories on the banks of the river Scheldt, which he termed the "rival of the Clyde." As Belgians had been the first on the European continent to build lines of railways, they were urged by the king to supplement these railroads by lines of steamers, and he called for regular lines to the African trading regions of Belgium. In consequence of the King's speech, Belgian capitalists almost immediately became interested in the project of establishing a line of steamers between Antwerp and the Congo Free State, to be manned by natives of the country. The idea, as reported, is to put shares on the market capable of being popularly subscribed for, and it is expected that there will soon be a considerable increase in the Belgian merchant marine through the development of Belgium's African trade possibilities. Such a marine, together with the opening of the interior by railways, promises a large commercial growth and prosperity. This increase in commerce has already been stimulated by the new railroad around the rapids of the Congo, which will furnish easy transit to Stanley Pool, some 250 miles above, and connect the lower river with the recommencement of the navigable Congo, whence vessels may ascend the stream for 1000 miles. A branch line is contemplated, also, from this road to Leopoldville, and an auxiliary line to connect the Lubefu with the Lomami and the Lualaba. In 1899 the government authorized a survey for branch lines to connect the Welle and the Nile regions with that of Tanganyika. Nearly a thousand miles of road will have to be constructed if this scheme is carried out.

Complete trade returns for the Congo Free State are not available for a period later than the year 1897, the figures for which, however, afford satisfactory proof of the rapid development of the state's resources. The total aggregate of trade for 1897 amounted to 40,884,288 francs, or not quite \$8,000,000, an increase of 25 per cent. over 1896 and nearly double the total trade figures for 1893. The total exports amounted to 17,457,090 francs as against 15,091,137 francs for 1896, and the imports amounted to 23,427,197 francs as compared with 16,040,370 francs in 1896. Among the exports a very considerable increase has taken place in the amount of India-rubber now obtained from different parts of the Congo State, the figures being 241,153 kilos for 1893; 338,194 for 1894; 576,517 for 1895; 1,317,346 for 1896, and 1,662,380 for 1897. Other exports consist of palm oil, ivory, palm kernels, nuts, rice, orchilla, gum, copal, ground nuts, and cam wood. About 223,776 kilos of coffee were exported during 1897. In consequence of the large exportation of rubber, the early destruction of the India-rubber trees in Congo has been threatened, the prevention of which was taken in hand by the Congo government in 1899. A bureau of control of rubber forests has been created and is charged with the enforcement of the decree of 1892, which forbids the gathering of rubber by any other mode than through incision in the bark. A decree has been issued, also, providing that for every ton of rubber annually yielded there shall be planted not less than 150 trees. As regards imports, two-thirds of the trade is now in the hands of Belgium. It is in the imports that the greatest increase in Belgian-Congo commerce has come about. No statistics previous to 1892 are obtainable as to the value of the goods imported by the Congo

state, but the following figures show the fourfold increase of Belgian goods imported by Congo within the five years ending with 1897: The year 1893, 4,442,662 francs; 1894, 6,227,909 francs; 1895, 6,003,465 francs; 1896, 10,102,407 francs; 1897, 16,272,029 francs. During this period the imports from England, Germany, and Netherlands have remained practically stationary, and French and Italian trade has shown a natural growth. Portuguese trade has declined.

Civilization and Government.—There is a central government at Brussels under King Leopold, with the three departments of foreign affairs, finance, and interior under a secretary of state. At Boma, the Congo capital, a governor-general administers the local government and European commissioners govern the various administrative districts. The future political policy was set forth by the King in his speech at Antwerp, when he declared that the state should be kept an absolutely neutral power, as Belgium had been. The army, commanded by European officers, consists of about 16,000 natives. The state has 20 steamers, divided between the upper and lower Congo, the larger number patrolling the river above the Stanley Pool, and it has besides a small navy of sailing vessels. The difficulties of governing over the vast stretches of the Congo, with its millions of inhabitants, are increased by a number of conditions due to the location and climate of the state. The first of these is the task of enforcing obedience to law among forest tribes, whose number is very great and whose dialects are innumerable, and which have little or no political union. An instructive account of some of the characteristics of these natives has been given by Mr. Albert B. Lloyd, the young Englishman who recently crossed the continent alone, except for native attendance, along the general route taken by Stanley. He entered Belgian territory at the frontier fort M'Beni, on the Semliki River, thence traversing the heart of the great pygmy forest, the northern part of which was crossed by Stanley. He travelled down the entire length of the Aruwimi, passing through immense tracts of forests, inhabited only by cannibals, to the junction of that river with the Congo. In this section he came in contact with the cannibal Bangwa tribe, which he describes as a very warlike people, who are noted for their wonderful workmanship in iron, which they make into spears, knives, etc. "They are at present," he says, "more or less cowed by the Belgians, but I doubt if this condition of affairs will be permanent, and I believe the Belgians will have trouble with them yet. There are many Congo state posts down the Aruwimi with white officers, and apparently they manage to keep on fairly good terms with the cannibals, by whom they are surrounded. Personally I was received most kindly by these cannibals. They are, it is true, warlike and fierce, but open and straightforward. I did not find them to be of the usual cringing type, but manly fellows, who treated one as an equal. I had no difficulty with them whatever." In regard to the many reported military movements on the Congo, Mr. Lloyd said in an interview late in 1899 that, according to report, Baron Dhanis was on an expedition in the Kasai district, and was experiencing great difficulty, especially in the matter of transport, owing to the swampy character of the country. The only other expeditions known of were those of Lieutenant Henry, who was on the way from Stanley Pool to Lado, and of Major Lothaire, who had just left Bangala for the north. Large numbers of troops were being trained at Bangala. Generally speaking, the whole Congo was quiet—certainly tranquillity prevailed along the river. An expedition was about to be sent north of Basoko against a very hostile tribe, and it was reported that it was not safe for any European to go more than two hours' journey to the north of Basoko. Besides the question of native control, there is also the unhealthfulness of the Congo climate, a condition strikingly set forth by consular reports of 1898, in which it is estimated that of every ten whites who become officers of the state, nine are buried or invalided within three years. It is also said that out of the twenty-four months for which the one hundred and twenty employees of the largest Belgian trading company contract, there is maintained an average service of only seven months.

Among the best efforts of the Congo administration in behalf of the native, has been the repression of the liquor trade among the wild tribes of the Congo, who are wild enough even when not under the unwholesome influence of European rum. A second benefit is the gradual suppression of inter-tribal wars, and the spread among the natives of a fear and dependence on a central government power; this result has been partially accomplished against the enormous disadvantages already mentioned. Credit is also claimed by the government for the diminution of cannibalism. The Belgians have also broken up the Arab and native slave trade. They require the slave, however, to pay for his freedom by a term of service with a new master for merely nominal wages. While the slave is from the first a free man nominally, and at the end of his term completely free, he is, while under the workings of the "libéré" system, a slave in fact. The state supports this system for the purpose of easily obtaining cheap labor. It must be fairly stated that the missionaries tell a different story of the effects of Belgian rule on the Congo natives from that

given out by the administration. Among their charges is the claim that the libéré system is itself a slave system, reserved by the government for its own benefit, while denying slavery to others; they say that great cruelty is practised upon the natives by officials, and they deny the assertion that cannibalism is decreasing. There appears to be considerable difficulty in getting at the facts in these matters.

The description given by Mr. Lloyd of his remarkable journey through Congo contains no more interesting or instructive a passage than that which tells of his experience in the wonderful pygmy forest of central Africa. His journey from the Belgian frontier post of M'beni on October 1, at which point he entered the great forest, is described by him in an interview quoted by the *Geographic Magazine*:

"Altogether I was twenty days walking through its gloomy shades. I saw a great many of the little pygmies; but, generally speaking, they keep out of the way as much as possible. At one little place in the middle of the forest, called Holenga, I stayed at a village of a few huts occupied by so-called Arabs. There I came upon a great number of pygmies, who came to see me. They told me that, unknown to myself, they had been watching me for five days, peering through the growth of the primeval forest at our caravan. They appeared to be very frightened, and even when speaking covered their faces. I slept at this village, and in the morning I asked the chief to allow me to photograph the dwarfs. He brought ten or fifteen of them together, and I was enabled to secure a snapshot. I could not give a time exposure, as the pygmies would not stand still. Then with great difficulty I tried to measure them, and I found not one of them over four feet in height. All were fully developed. The women were somewhat slighter than the men, but were equally well formed. I was amazed at their sturdiness. Their arms and chests were splendidly developed, as much so as in a good specimen of an Englishman. These men have long beards half way down the chest, which imparts to them a strange appearance. They are very timid and cannot look a stranger in the face. Their eyes are constantly shifting, as in the case of monkeys. They are fairly intelligent. I had a long talk with the chief, and he conversed intelligently about the extent of the forest and the number of his tribe. I asked him several times about the Belgians, but to these questions he made no reply. Except for a tiny strip of bark cloth, men and women are quite nude. They are armed with bows and arrows—the latter tipped with deadly poison—and carry small spears. They are entirely nomadic, sheltering at night in small huts two to three feet in height. They never go outside the forest. During the whole time I was with them they were perfectly friendly.

"There are no Europeans in any part of the forest, but there are a few villages containing three or four houses, which are known as auxiliary Belgian stations. They are occupied by so-called Arabs, who have been placed there by the Belgians. In parts I found a fairly good track, perhaps a couple of feet wide, overhung and crossed by boughs and enormous creepers; but, generally speaking, it was easier to cut our way right through the tropical growth. In places the darkness was very great. Once I tried to photograph my tent at midday, but even with nearly half an hour's exposure the attempt was a failure. Occasionally I came upon a very small natural clearing; but, generally speaking, the growth was very dense, and it was like advanced twilight. In many places it was impossible to read even at noon. I walked during the three weeks I was going through the forest, as, although I had a donkey with me, if I had ridden him, I should have continually been pulled off by the creepers. We had several narrow escapes from falling trees. On one occasion my two boys and myself, who were at the head of the party, had just passed under an enormous tree, when it fell with a crash between us and the rest of the carriers. Had we passed two seconds later, it would have fallen on us. I measured one tree which had fallen across the track, and found it to be twenty feet in circumference. The deathlike stillness of the forest was continually broken by reports like thunder as these giant trees fell crashing to the ground. At night-time these reports were most startling. The forest is literally alive with elephants, leopards, wild pigs, buffalo, and antelope. Fires at night kept off any leopards that might have been prowling round our little encampment. At night I used to fasten my tent to the trunks of trees and surround the camp with a zariba of small trees. We never had a guard at night. The first Europeans I met after leaving the forest were two Belgian officers at a place called Mawambi, on the Ituri River. Just after reaching that place I again struck Stanley's route, and marched for ten days along the banks of the Ituri to the village of Avakubi. Travelling here was very difficult—in fact, almost as bad as in the great forest. The tracks were all overgrown and the country practically uninhabited. Its only occupants were cannibals. At Avakubi, which place I reached on October 20, I got two large dugout canoes and embarked on the Aruwimi. The natives rigged up a little covering on one of the boats for protection from the sun, and this nearly cost me my life. I was in this boat and we were just starting down a strong rapid when the craft began to sink, and I was unable to get free of the covering. I eventually got to the surface in an exhausted condition, but

I lost a large number of photographs. Ten days' journey down the Aruwimi brought us to its junction with the Congo at Basoko. This was regarded as a very quick journey, but we were, of course, going down-stream. At one place I put together the bicycle I had with me, and, at the suggestion of these people, rode round their village in the middle of a forest. The scene was remarkable, as thousands of men, women, and children turned out, dancing and yelling, to see what they described as a European riding a snake. At Basoko, on the Congo, I embarked in the river steamer *Ville de Bruxelles* and came down the river, calling at stations *en route*. After a journey of six hundred miles in the boat I reached Leopoldville on November 24. There I joined the railway, which I may say is one of the most wonderful things I have seen in Africa. I travelled in an arm-chair in an excellent saloon carriage, and finally reached Matadi, whence I proceeded to join the Portuguese mail steamer for Lisbon."

CONGREGATIONALISTS, a body of Christian churches in the United States. In 1899 they held an international council in Boston, the second in the history of this denomination. Their American Missionary Society and Home Missionary Society have established missions in Cuba and Puerto Rico. The next triennial meeting will be held at Portland, Me., in October, 1901. The Congregationalists report 5639 ministers, 5620 churches, and 628,234 members. The latest report of the commissioner of education shows the Congregationalists to have 26 institutions of learning, with 492 professors, 4472 students, and endowment funds aggregating \$9,640,291.

CONGREGATIONAL METHODIST CHURCH, organized in Georgia in 1852, has congregations in the Southern States, and in Illinois, Pennsylvania, Delaware, and New Jersey. A semi-monthly paper is published by them at Cave Spring, Ga. In 1899 they had 260 ministers, 275 churches, and 13,000 communicants.

CONGREGATIONAL NATIONAL COUNCIL, composed of delegates from the Congregational churches, organized in 1871, meets once in three years. Its next meeting will be held in Portland, Me., in October, 1901. Officers: Rev. Frederick A. Noble, moderator; Rev. H. A. Hazen, Auburndale, Mass., secretary; Rev. S. B. Forbes, treasurer; and Rev. W. H. Moore, registrar.

CONGRESSIONAL LIBRARY, founded in 1800, destroyed in 1814 when Washington was captured, and reorganized after the gift of Thomas Jefferson's library. In 1899 the librarian of Congress, John Russell Young (*q. v.*), died, and Herbert Putnam (*q. v.*) was appointed his successor. In the report of the librarian, dated December 4, 1899, the present librarian states that during the last fiscal year, ending June 30, 1899, the total expenditures were \$159,854, and that the copyright business brought in a net income of \$17,994. The total annual disbursements for the maintenance of the library were \$106,395, including \$20,000 for furniture. Since the last librarian's report there were added 56,316 books and pamphlets, making a total in 1899 of 957,056 books and pamphlets in the library. During the year 1899, 1866 manuscripts were added, including 220 large cases of manuscripts, books, and pamphlets constituting the Spanish archives at San Juan de Puerto Rico. The number of maps and charts added was 1986, making a total of 52,181. The librarian had in preparation a bibliography of works relating to the construction, care, classification and cataloguing of maps, a list of maps in the library of Congress relating to the Revolutionary War, and a list of those relating to the city of Boston. In the 13 months ending June 30, 1899, 23,083 musical compositions were added, making a total of 277,465; during the last fiscal year 10,915 prints were added, making a total of 70,823. The main reading-room is open from 9 A.M. to 4 P.M. from July 1 to September 30, and until 10 P.M. the rest of the year, and during the last year there were recorded 121,270 readers. The books supplied were 297,662 and 20,650 books were issued for home use. A reading-room for the blind was open daily, and was visited by 31,000 persons, of whom, however, only 885 were unseeing. The law library consists of 103,906 volumes.

CONNAUGHT and STRATHEARN, DUKE OF (Prince Arthur William Patrick Albert), third son of Queen Victoria, was born in Buckingham Palace, May 1, 1850. In 1866 he entered the military academy at Woolwich, and became lieutenant in the Royal Engineers in 1868, and lieutenant in the Royal Artillery in 1869. On the establishment of the Rifle Brigade in 1871 he was made a captain in excess. In 1874 he was created Duke of Connaught and Strathearn, and took his seat in the House of Lords. In 1878 he married Princess Louise Margaret of Prussia, daughter of Prince Frederick Charles of Prussia. By the death of Prince Alfred of Saxe-Coburg in 1899, he became heir to the Duchy, which he and his heirs renounced in favor of the young Duke of Albany. The Duke of Connaught has served as brigade-major at Aldershot; assistant adjutant-general at Gibraltar, and general of brigade at Aldershot. He commanded the first brigade, first division, in the Egyptian expedition in 1882, and was thrice mentioned in despatches for his work at the battles of Mahshuta

(Courtesy of *Review of Reviews*.)

THE NEW CONGRESSIONAL LIBRARY AT WASHINGTON.

and Tel-el-Kebir. In 1882 he was made honorary colonel of the Thirteenth Bengal Lancers, serving in Egypt, and in 1886 was appointed to the command of the Bombay army. Returning to England in 1890, he was made commander of the southern district in England. In 1893 he was appointed commander-in-chief at Aldershot, succeeding Sir Evelyn Wood, and was promoted to the full rank of general.

CONNECTICUT, one of the New England States of the United States, has an area of 4990 square miles. The capital is Hartford.

Agriculture.—The following shows the production and value of the principal crops in the calendar year 1899: Corn, 1,799,811 bushels, \$899,906; wheat, 5490, \$5216; oats, 525,056, \$194,271; rye, 256,464, \$164,137; buckwheat, 72,333, \$45,570; potatoes, 3,323,060, \$1,528,608, and hay, 446,953 tons, \$6,480,818. Live stock, January 1, 1900, comprised, horses, 44,119, \$3,259,754; milch cows, 144,529, \$5,029,609; other cattle, 66,188, \$2,045,545, and sheep, 31,808, \$124,194.

Industries.—In the fiscal year ending June 30, 1899, the collection of revenue on taxable manufactures in the district of Connecticut, which also includes Rhode Island, with Connecticut predominating, aggregated \$2,916,759. There were 54 manufacturers of tobacco and 480 of cigars alone, and the production was 37,942,612 cigars, 916,900 cigarettes, and 26,153 pounds of smoking tobacco. Fruit and grain distilleries in operation numbered 32; amount of fruit brandy produced, 8422 gallons; distilled spirits gauged, 1,264,168 gallons, and fermented liquors produced, 673,299 barrels. The annual report of the State Shell Fish Commission showed an increase of 1000 acres in the amount of oyster grounds under cultivation, and the estimated output of oysters in Long Island Sound in the year was 2,861,455 bushels, against 1,500,000 bushels ten years ago. Quarrying during the calendar year 1898 yielded granite to the value of \$682,768; sandstone, \$215,733, and limestone, \$142,057—total, \$1,040,558.

Commerce.—In the fiscal year ending June 30, 1899, the imports of merchandise at the ports of Fairfield, Hartford, New Haven, New London, and Stonington aggregated in value \$735,221, an increase in a year of \$11,165; exports, none.

Banks.—On October 31, 1899, there were 79 national banks in operation and 19 in liquidation. The active capital aggregated \$20,657,070; circulation, \$8,409,801; deposits, \$44,688,526; and reserve, \$12,176,670. The State banks, June 30, 1899, numbered 8, and had capital, \$2,240,000; deposits, \$7,346,370; and resources, \$10,768,445; loan and trust companies, 13, with capital, \$1,296,100; deposits, \$7,660,387, and resources, \$10,048,424; and mutual savings banks, October 1, 1898, 89, with depositors, 375,810; deposits, \$163,482,299, and resources, \$173,925,546. The exchanges at the United States clearing-houses at Hartford and New Haven in the year ending September 30, 1899, aggregated \$221,297,801, an increase of \$16,277,113 in a year.

Railways.—No new construction was reported in 1898. In 1899 new mileage amounted to 16.40, giving the State a total of 1024.55 miles.

Education.—The annual report of the State Board of Education, issued in 1899, shows a total enrolment in the public schools of 184,386, and an expenditure for running expenses of \$2,896,152, against \$1,408,374 in the previous year. The school population was distributed by counties as follows: New Haven, 56,405; Fairfield, 38,604; Hartford, 36,598; New London, 17,012; Littlefield, 12,581; Windham, 9748; Middlesex, 8192, and Tolland, 5416. The report contains a discussion of existing educational methods, which may be summarized as follows: The chief problems immediately before the State are the gathering of all the children into the schools, the training of skilful teachers, the rescue of children from poor teaching by a higher standard of teaching qualifications, and a radical reform of high school education. For advanced education there were 68 public high schools, with 307 teachers and 6881 students; 62 private secondary schools, with 312 teachers and 2734 students; 4 public normal schools, with 89 teachers, 536 students, grounds and buildings valued at \$290,000, and income, \$16,000; and a school of technology, with 15 teachers and 108 students. The universities and colleges for men and for both sexes numbered 3, and had together 301 instructors, 2963 students, 14 fellowships, 434 scholarships, 323,000 volumes in the libraries, \$6,743,030 invested in grounds and buildings, and \$5,919,771 in productive funds, and total income, \$847,420; benefactions, \$127,500. The Storrs Agricultural College had 100 acres under cultivation, farm land worth \$15,000, and buildings and equipments worth \$70,000. A noteworthy educational event of the year was the election on May 25 of Professor Arthur Twining Hadley, of the chair of political economy in Yale University, as successor to President Timothy Dwight, whose resignation took effect July 1. At the end of the year there were 197 periodicals, of which 48 were dailies, 107 weeklies, and 26 monthlies.

Finances.—The total assessed valuation in 1898 was \$552,887,762, an increase of \$18,422,505 in a year; total funded debt, October 1, 1898, \$3,240,100; civil list funds, \$463,891; net debt, \$2,776,209—reduction in a year, \$340,963. The bulk of the bonded debt is for the renewal of war loans, due in 1903 and 1910.

Harbor Improvements.—In continuation of its work along the Sound, the federal government completed and garrisoned the new fortifications on Plum and Gull

islands, both points being mounted with heavy disappearing guns of the latest pattern. Work on the new fortifications on Fisher's Island and at Napatree Point, near Stonington Harbor, was prosecuted with vigor throughout the year. When these are completed the four points will form a strong barrier against a hostile fleet seeking to pass the eastern entrance to the Sound. Under an appropriation of \$200,000 by Congress, the federal government began establishing a naval coaling station on the Thames River, three miles above New London, and it was expected that the work would be completed in the spring of 1900, with a storing capacity of 25,000 tons.

Population.—As estimated by federal officials, the population on June 30, 1899, was about 875,000.

Legislation.—The constitutional amendments proposed provide that a plurality of votes shall elect State officers and fix the minimum and maximum number of State senators. In the matter of divorces, if they are petitioned for to the General Assembly, they must receive attention from the attorney-general. The national and State flags must not be desecrated. Adulteration of food is forbidden under penalty. Bakeries must not be in cellars and are subject to inspection. Pure water and ice must be furnished. In the interests of the laboring classes it was enacted that no child under fourteen years of age shall be employed during school hours. No employee shall be coerced not to join a labor organization. The inspector of factories must examine all factories and workshops and see that they are well ventilated, that the machinery is well guarded, and that sanitary conditions are perfect. A highway commission was created to supervise and control all State roads. Attendance at school was made compulsory, and no distinction is to be made because of race or color.

State Officers and National Representatives.—Governor, George E. Lounsbury; lieutenant-governor, Lyman A. Mills; secretary of state, Huber Clark; treasurer, Charles S. Mersick; comptroller, Thompson S. Grant; auditor, Walter G. Riley; attorney-general, Charles Phelps; adjutant-general, Louis N. Van Keuren; insurance commissioner, Edwin L. Scofield. Supreme Court: Chief justice, Charles B. Andrews; associate justices, David Torrance, Frederic B. Hall, Simeon E. Baldwin, William Hamersley; clerk, George A. Conant. The State legislature consists of 201 Republicans and 72 Democrats and 3 Gold Democrats. Senators: Orville H. Platt (Rep.), from Meriden, and Joseph R. Hawley (Rep.), from Hartford. Representatives: E. Stevens Henry, from Rockville; N. D. Sperry, from New Haven; Charles A. Russell, from Killingly, and E. J. Hill, from Norwalk—all Republicans.

CONSUMERS' LEAGUE, NATIONAL, United Charities Building, New York City. President, John Graham Brooks; secretary, Mrs. Florence Kelley. The first Consumers' League of America was organized in New York in 1890, as the outcome of inquiries made by the Working Women's Society into the conditions under which saleswomen and cash girls work. The idea at first was to found an organization among these wage-earners, but it was found that the formation of a trades union among this particular class of workers was undesirable, and would be much less useful in bringing about improvement in the condition of working women than an organization among the spenders of money. In recognition, therefore, of the fact that the majority of employers are virtually unable to improve conditions as to wages and hours unless sustained by public opinion, law, and the action of consumers, Consumers' Leagues were formed in a number of cities with the object of forming public opinion so as to lead consumers to recognize their responsibilities and by other methods to ameliorate the condition of the women and children employed in retail mercantile stores. In 1898 the National Consumers' League was formed, composed of the existing State leagues of New York, Massachusetts, Pennsylvania, and Illinois. The most important articles of the constitution adopted by the League are: (1) That the interest of the community demands that all workers should receive not the lowest wages, but fair living wages; (2) that the responsibility for some of the worst evils from which wage-earners suffer rests with the consumers, who persist in buying in the cheapest market regardless of how cheapness is brought about; (3) that it is therefore the duty of consumers to find out under what conditions the articles which they purchase are produced, and to insist that these conditions shall be at least decent and consistent with a respectable existence on the part of the workers; (4) that this duty is especially incumbent upon consumers in relation to the products of woman's work, since there is no limit beyond which the wages of women may not be pressed down, unless artificially maintained at a living rate by combinations, either of the workers themselves, or of consumers. The efforts of the League have been actively directed toward the accomplishment of its purpose, by popular education through meetings, clubs, and literature, and by co-operation with retail merchants in the establishing of "fair houses"—that is, establishments dealing justly with their employees, as will be detailed below. Such

houses are placed on a "white list," to be furnished to consumers. Efforts are made toward the bringing about of regulations insuring fairness as to wages, hours, payment for over-time work, half-holidays during the summer months, an annual vacation of at least one week, equal wages for equal work, irrespective of sex, sanitary and physical conditions, and various minor matters. The Consumers' League further seeks the co-operation of the law and of such of its agents as factory inspectors, health boards, etc., and of clerks' associations, working-girls' clubs, store management and the like, and aims even to influence legislation. The League seeks the abolition of all sweat-shop work, by investigation and by means of the white list, and by the boycotting of goods known to be so made. There is in use a "Consumers' Label," which guarantees to the buyer that the materials bearing it are "white goods," manufactured under conditions tested and approved by the League. Among minor efforts of the League may be mentioned the appeal to merchants to give supper money at the holiday time to girls working in the evening; the endeavor to impress on women shoppers the fairness of shopping before 5 P.M., and not on Saturday afternoons, and the effort to protect delivery clerks from the very late hours by a movement among consumers to decline to receive parcels after a certain hour in the evening. The results of these efforts have in many cases been quite satisfactory. Thirty-five firms in New York City are reported as on the "white list," which shows an improvement of conditions, and a certain amount of consideration and co-operation already at work. The mercantile inspection law of New York State, passed in 1896, was largely due to the suggestions and influence of the Consumers' League and its friends. By this law State protection was extended from the factories to mercantile establishments, regulating hours, labor, sanitary conditions, leisure for luncheon, and the matter of seats behind counters. In New York, in 1898, the city government cut off the appropriation for the special inspectors under this law, but the Board of Health is co-operating with the League in giving attention to the more flagrant violations. A higher standard, all in all, is felt to have resulted from the passage of the bill. The State labor law, which went into effect September 1, 1899, is expected to afford aid to the league in its war on the sweat-shop system. Whereas the old law allowed the tenant or family of the tenant to manufacture clothing in his dwelling-place without notifying the factory inspector or obtaining a license, the present law compels all home-workers to obtain a license; manufacturers shall keep a list of all home-workers in their employ, which shall be presented on demand to the factory inspector; by similar laws in Illinois and Massachusetts, such lists are placed on file as public records, accessible to all who may wish to ascertain under what conditions goods are made.

The "Consumers' Label" is used to enlist the individual buyer in the work of the League, and its attachment to garments certifies that they have been made under clean and healthful conditions, guaranteed after investigation. These conditions are further insured by the agreement which the manufacturer using this label makes, which is, that all provisions of the State factory law shall be complied with; that the label is to be used only on goods manufactured by said manufacturers in said premises; that no child under sixteen shall be employed; that working-hours shall not exceed ten hours per day or sixty hours per week; that duly accredited representatives of the League shall be allowed to inspect said factory at any reasonable times, and that reasonable requests for improvement made by the League shall be complied with. Goods bearing the label will be advertised by the League, and the community urged to purchase such goods.

It will be seen that the work of the Consumers' League proceeds along lines supported by definite economic principles, especially that which emphasizes, in the relation of consumption to production, the moral duties involved for society and the individual. These duties have grown out of the principle that the consuming or buying public directs or controls the producer. It is assumed that economic reform is therefore most likely to come through the agency of the consumer, and the Consumers' League has taken up the work of educating the latter, so that he may best influence the producers to institute the needed reforms. How the organization has gone about this has already been told. In an essay on the principles of the League and the possibility of carrying them out, Mr. John Graham Brooks, the president of the association, quotes the manager of a large New York store as saying that this kind of work had unquestionably corrected real abuses which the employers would not have corrected themselves, at least for a long time. A beginning, only, has been made, the large merchants expressing themselves as being perfectly willing to use the labels and conform to stated conditions wherever there should be a general demand for them. They frankly acknowledge the sensitiveness of the trade to the demands of the buying public. The same influence is recognized by those who sell only union-made goods, the labels on which testify that the goods were made according to union conditions. This principle is also being applied, though not very successfully thus far, by the Audubon Society, which appeals to women

not to buy birds for decorative purposes, or hats decorated with birds. As the refusal by women to buy such hats would eventually stop the destruction of birds, so the general buying of goods marked by a League label insures clean and healthful conditions for those who work in their manufacture, and the patronage only of "white houses" would, in time, it is argued, drive other establishments also to seek the trade which goes to houses whose employees receive fair treatment.

CONSUMPTION. See TUBERCULOSIS.

COOK, JOHN MASON, head of the great Cook tourist agency, died in London, March 4, 1899. He was the son of Thomas Cook, who in 1841 began in England the excursions which led to the founding of the agency. He was born in Market-Harborough, Leicestershire, in 1834; was educated at schools in his native town and Leicester, and in 1856 entered the employ of the Midland Railway Company as superintendent of excursion traffic. Here he remained three years and then entered his father's tourist business, of which he afterward for many years was sole manager. He visited nearly every country in the world, establishing agencies and effecting arrangements to facilitate excursions, and to him the wonderful development of the agency is due. Besides the regular tours offered by the agency, it has arranged numerous excursions to every international exposition since 1850. During the last ten years of his life Cook passed much of his time in Egypt and the Levant. He personally made arrangements for the German Emperor's visit to Palestine in the fall of 1898; for the services rendered on this occasion by himself and his eldest son, Mr. Frank H. Cook, the Emperor conferred on them, respectively, the decoration of the Order of the Golden Crown of Prussia and of the Order of the Red Eagle. While conducting this tour Cook contracted an illness from which he never recovered.

COOPER, JOB ADAMS, ex-governor of Colorado, died January 24, 1899. He was born in Bond County, Ill., November 6, 1843. He served in the Civil War with the One Hundred Thirty-seventh Illinois Volunteers. In 1865 he was graduated at Knox College, and two years later was admitted to the bar. He moved to Denver in 1872, and in 1888 was elected governor of the State, as a Republican. At the close of his term of office he was made president of the National Bank of Commerce of Denver. For many years he was engaged in banking and stock-raising in Colorado.

COOPER UNION FOR THE ADVANCEMENT OF SCIENCE AND ART, occupies the block between Third and Fourth Avenues, south of Astor Place, New York City. The charter was secured by legislative enactment, February 17, 1857, and the carrying out of its provisions was made possible by the generosity of Peter Cooper. The institution has a well-equipped museum for the study of the arts of decoration and a library and reading-room. There are day and evening classes, with 40 instructors, in which art is taught in all its branches, the higher mathematics and physical sciences, stenography, typewriting, and telegraphy. All facilities are free. On December 20, 1899, Andrew Carnegie gave \$300,000 toward the endowment of a mechanics' art day school in Cooper Union. The families of Mr. Cooper and Mr. Abram S. Hewitt also contributed the sum of \$200,000 for the school, thus making its endowment \$500,000. The idea of the school is not to teach a trade, but to teach the use of tools. The new school, which will open in the fall of 1900, will provide for the instruction of 500 students. The permanent endowment fund of Cooper Union now amounts to \$1,718,047. Instruction is free. President, Edward Cooper; secretary, Abram S. Hewitt.

COPPER. The production for 1898 was:

Domestic copper.....	526,512,987 pounds.
<i>Imports.</i> —	
Fine copper in ore, entered for consumption }	19,750,000 "
Fine copper in regulus, entered for consumption }	
Bars and ingots }	50,840,000 "
Old copper }	
	597,102,987 pounds.
<i>Exports.</i> —	
Ingots and bars.....	291,955,905 pounds.
Estimated fine copper, contents of matte.....	5,420,000 "
	297,375,905 pounds.

The imports came chiefly from Canada and Mexico. The domestic production for 1899 (in part estimated) is 592,672,637 pounds.

The three important copper-producing States—namely, Montana, Michigan, and

Arizona—held the same rank in 1899, though exact figures of production are not yet available. The operations at Butte have been much hindered by important litigation between the companies there, and in Michigan, owing to the increased demand for copper, a number of old and some new properties were started up. Arizona probably shows the greatest increase, and may in the next few years develop some important properties, especially in the Grand Canyon region.

COREA, an Asiatic kingdom, tributary to China previous to 1895, has an area of about 82,000 square miles, and a population variously estimated at from 8,000,000 to 16,000,000 inhabitants. Recent statistics place the number of inhabitants at 10,528,937. The capital, Seoul, has 200,000 inhabitants. The foreign population in 1897 numbered 10,000 Japanese, 4000 Chinese, and about 3000 other foreigners, of whom 130 are Americans and 73 British. For many years little was known concerning Corea, and even to-day the interior is largely an unknown country, both as regards the people and the nature of the soil. The country, however, is gradually being opened up. The agitations of the past few years, which brought about the nominal independence of Corea, have also awakened that country in part from its conservatism and lethargy. Corea stands as one of the most interesting, though one of the smaller, countries of Asia. China is watching the fate of Corea in fear of her own future, and Russia's designs on Corea are noted by England and Germany. The most interested of all is Japan, to whom Corea is the natural complement, and a country useful as an agricultural provider for Japan as that nation becomes more and more the industrial power of the East. The future prosperity, not only, but the independence of Japan would be threatened should the splendid ports of Corea, which command the Japanese and Chinese coasts, fall into Russia's hands and be used for the mobilization of native Russian armies.

Commerce and Agriculture.—The commerce of Corea received a set-back in 1898 by the shortage in rice crops, one of the staple productions of the country. This is shown by the United States Consular Reports for July, 1899, in which the total trade for 1898 is placed at 17,527,864 yen (\$8,763,932 gold) against 23,511,350 yen for 1897, a loss for the year of 5,983,486 yen, or \$2,991,743. The short crop in rice really occurred in the previous summer of 1897, but the scarcity apparently had not been made up by the generous crops of 1898, and the people seemed inclined not to part with their food supply as readily as in former years of plenty. This falling off in trade is probably but temporary, since commerce has steadily increased in Corea for some years in all branches. American imports to the value of over 1,270,075 yen, or \$635,038, were brought to Corea in 1898, an increase over 1897 of more than \$200,000. The principal items were railroad material, \$297,862, and kerosene, \$189,380. Manchester sheetings are being largely replaced in Corea by Japanese cotton yarns, which are woven by the Corean women on their hand looms at home. As the labor of women is not considered of any value, a more durable cloth is obtained for less money than would be obtained for the imported article. The importation of cotton yarns from Japan, besides rendering possible a cheaper native cloth for Corea, signifies the part that Japan will soon play as an industrial competitor in the East of European and American manufacturers. The import into Corea of shirtings and sheetings for 1898 is estimated to be 500,000 pieces. The United States Consular Reports for July, 1899, state that from reliable data it is estimated that within a few years Corean imports will show a percentage of 90 per cent. Japanese yarns to 10 per cent. sheetings and shirtings, instead of just the opposite, as has lately prevailed. Announcement was made by the Corean government in May, 1898, that four new ports, making ten such in all, were to be opened to foreign trade and residence. These were Kuhn San, on the west coast, south of Chemulpo; Masampo, on the southern end of the peninsula, near Fusan, and an obscure place called Sunghin, on the east coast; while the northern capital, Peng Yang, whose port of entry, Chenampo, had been opened the previous year, was to be opened as a trade mart. The date for the formal opening of these ports was officially announced as May 1, 1899. The mercantile apathy of the Coreans is very great, and the rich markets of their country are largely in the hands of the Chinese and Japanese. These nationalities have acquired so much real estate through the foreclosure of mortgages, obtained through credit to the Coreans, that the Corean government has begun to object to recording title deeds, lest the capital city of Seoul and other places slip entirely into the hands of these foreigners.

Productions and Industries.—The various industries connected with whaling, coal and gold mining, railroads, and trolley lines have attracted the most attention in Corea recently, and several, especially the electric trolley, are sufficiently remarkable in that backward country to call for a larger mention than can be given here. In connection with the discussion of the foregoing subjects it may be said, in general, that akin to the feeble commercial instincts of the people is the reluctance with which they allow other people to do what they themselves cannot or will not do. Their natural conservatism and their recent introduction to the outside world,

together with the betrayal of trust by foreigners, who have been favored in the past, are the principal causes of this attitude. Thus, when a foreigner asks for a right to develop some interest in Corea, he is immediately looked upon with suspicion. Recent efforts to obtain concessions for mining the large unworked deposits of coal in Corea have failed as signally as similar efforts in the past, while the Corean continues to use wood and grass for fuel, together with decayed surface coal. The existence of these important coal deposits may yet play a part in the political future of Corea. During the year 1898 a concession was granted to an English syndicate for a gold-mining district, to be worked for a period of twenty-five years, upon terms similar to those of the American and German concessions—that is, a payment of one-fourth the net proceeds to Corea. The American company's mines include the whole district of Woon San, 1000 square miles, and employ nearly 40 Americans and about 1200 Coreans. The company works 20 stamps, and 40 stamps more from the Union Iron Works are being erected. Among other concessions, a Russian company has received a license to catch whales and to bring them into one of three ports on the east coast of the peninsula, for the purpose of cutting them up for shipment. The Russians salt the blubber and flesh, and sell it at good prices in Japan, where it is largely consumed as food. Some 2,031,000 pounds of whale-flesh were imported into Nagasaki alone during 1898, valued at 112,940 yen, or \$56,470 gold. The Coreans themselves are indifferent fishermen and neglect this industry. The political aspects of this Russian concession are discussed under Recent History. Among the most interesting events, not only of the year, but of the entire history of Corea, is the practical completion of the first steam railroad and of the first electric trolley-line in the country which for centuries had closed its doors to the whole civilized world. The first is the Seoul-Chemulpo Railway, a road 25 miles in length, standard American gauge, connecting Seoul, the capital of Corea, with Chemulpo, the chief port of the country. This road was built for the American concessionaire, James R. Morse, at a cost of \$1,500,000 gold, and includes a large iron bridge over the Hans River, costing \$190,000. The road was built by American engineers, and the materials and equipment are almost entirely from America. It was sold by Mr. Morse on December 31, 1898, to a Japanese syndicate, and is nearly completed. The Japanese have a concession for a railroad, in addition, to connect Seoul with Fusan, to cost from \$12,500,000 to \$25,000,000. The road will be broad gauge and the distance about 400 miles. The road may be bought by the Corean government on appraisement after 15 years of operations. Much of the equipment for this road also will probably be purchased in the United States. The American contractors who built the Seoul-Chemulpo railway have also completed the construction of the overhead trolley electric street railroad, some six miles in length, in Seoul, the materials for which came from America and Japan. It was feared that the running of the first car on this road would be the signal for a demonstration by the superstitious natives, but the latter are said to have taken kindly to the new method of transportation, and regularly patronize the line. The productions of Corea, including rice, wheat, beans, barley, millet, oats, and other grains, tobacco, and ginseng, play an important part in the life and trade of the country. Besides the conditions affecting rice in 1897-98, already alluded to, it is reported that abnormally dry weather in the spring of 1899 produced a famine which caused considerable disturbance among the starving populace in the country districts.

Recent History.—The principal political happenings reported for the years 1898-99 concern in the main the rivalry between Japan and Russia for influence in Corea, and the continuation within the kingdom of the struggle between the Progressive party and the native rulers. In order to gain a clear idea of the Russian-Japanese influences in Corea, it may be recalled that after the Chino-Japanese war, which resulted in the relinquishment of the suzerainty of China over Corea and the nominal acknowledgment of the latter's independence, the dominating influence in Corea was Japanese. Japan professed to be willing to leave the country as soon as the Corean government should be able to restore order out of the disturbed conditions following the war, but troops were stationed there to protect the Japanese consulate and subjects, and a new cabinet was formed under Japanese influence. In the revulsion following the reforms instituted by Japan—a state of disorder believed by many to have been secretly stirred up by Russia—occurred the assassination of the Queen and the flight of the King to the refuge of the Russian legation at Seoul. Some of the ministers were arrested and beheaded, the rest fleeing to Japan, and the King formed a new cabinet under the influence of the Russian government. Russia's influence was in the ascendancy for only a short time, owing to the firm hold acquired on the country by Japan. The Independent Club, for the defence of the people's rights against the oppression of the Corean authorities, was formed about this time, and forced the King to dismiss the Russian officials from the government service. It also prevented the lease to Russia of Deer Island, commanding Fusan harbor. Russia, however, before retiring, formed an agreement with Japan by which the two powers were to advise the reduction of Corean expenditure, and

were to leave that country as soon as the financial and economical situation would permit them to do so. Almost immediately afterward, in the following year, Russia broke faith and forced Corea practically to place her finances and army affairs under Russian control. England stepped in, and, by means of a naval demonstration, compelled Russia to reinstate the former Korean customs and financial agent, a British subject, and Japan backed up, by a mobilization of her forces, her demand for the annulment of the new Russo-Corean agreement, and a more definite arrangement with Russia respecting Corea. These combined demonstrations resulted in 1897 in a settlement with England, and in 1898 Russia and Japan mutually agreed to recognize the sovereignty and complete independence of the Korean kingdom. Neither was directly to interfere in the government, and in case of a request for assistance from Corea, neither power should take active steps without consulting with the other. Russia, in recognition of Japanese progress and settlement in Corea, promised to do nothing to injure her commercial or industrial relations there.

The year 1899 closed with the Japanese influence in Corea again in the ascendancy over that of Russia, the rivalry between the two powers having continued notwithstanding the Russo-Japanese agreement of 1898. The dictatorial reform methods of Japan in 1895 and the harshness of the Russian officials after the flight of the King, had successively affected the respective ascendancies of Japan and Russia, and in 1898 the rival forces reached a somewhat even balance. But early in 1899 came the news that Russia was to be given the lease of three ports on the eastern coast of Corea to be used by the Russian whale fisheries mentioned above. This seemed at first to indicate the growing power of Russia, especially as the rumor of Russian railways to connect these ports with Vladivostock indicated a permanent hold in Corea. But the existence of Japanese prestige was evidenced by the restrictions placed by the Korean government, at the instance of Japan, upon the concession of these whaling stations. Instead of each station being 15 miles long, as asked by Russia, each is to be 700 feet by 300 feet, and for whaling purposes only, on a lease of twelve years, under the supervision of the maritime customs, Korean rights being safeguarded. The Japanese have been promised similar concessions. It is evident that relations between Japan and Russia are still far from harmonious. Toward the end of the year there were reports of coming trouble, it being alleged that to preserve autonomy in Corea or to prevent Corea's absorption by Russia, Japan would even fight. Such talk appeared to be confined to the press and magazines, but the belief is held by many that Russia—who has in pursuance of her ambitious designs in the east advanced to the very doors of Corea—is waiting only for an opportunity for the ultimate absorption of the kingdom. As an instance, the seizure of the reins of the impotent Korean government in 1897 and their apparently contemptuous release in 1898 is quoted "as a hand thrown out to feel the pulse of the powers." Internal affairs in Corea in 1899 were not promising. In March the cabinet was dismissed and two of the ministers banished. The efforts of the Independent Club to bring about reforms led the Korean Emperor, late in 1898, to order its disbandment. Then the People's Union was formed, and it demanded the re-establishment of the former organization, the punishment of what it termed the Emperor's bad advisers, and the enforcement of the new laws and regulations. Meanwhile the anti-progressives had formed the Peddler's Club, said to have been made up of some of the worst elements of the country, including bandits. This organization came to blows in Seoul one day with members of the Independent Club, but although they were aided by the police and soldiers, they were decisively beaten by the Independents. In June some members of the Progressive party showed their progressiveness by attempting to remove their leading opponents by blowing them up with dynamite. Previous to the latter event the government had caused the arrest of a score or more of prominent Independents for alleged complicity in a plot to unseat the Emperor and declare a republic. At the trial, which was to have been secret, several thousand sympathizers forced their way into the court-room, and the court, seeing that it would be impossible to convict the prisoners illegally before the eyes of so many people, merely set them free without any trial. Imperial decrees dissolving the People's Union also being without effect, its assembly, as soon as the government found it really had no European backing, was dispersed by force of arms. Recently the Emperor has ruled absolutely and with much severity, forbidding any public meetings. One result of this policy has been the emigration of thousands of the inhabitants across the borders of Manchuria and Siberia, and nearly all of these are said to have become naturalized Russians. As they keep up some intercourse with their relatives in Corea, the knowledge of Russia is being increased and Russian influence has found a new opportunity for growth.

COREY, CHARLES HENRY, D.D., Baptist clergyman and president of the Richmond (Va.) Theological Seminary, died at Seabrook, N. H., September 5, 1899. He was born at New Canaan, N. B., December 12, 1834; in 1858

he was graduated at Acadia College, Nova Scotia, and subsequently at the Newton (Mass.) Theological Seminary. Just before the Civil War he was ordained to the Baptist ministry, and was called to a charge at Seabrook, N. H. He soon resigned, however, and joined the Army Christian Commission, with which he served throughout the war. In 1867 he became principal of the Augusta (Ga.) Institute, and in 1868 was called to the presidency of the Richmond Theological Seminary for the training of colored ministers. He retained this position to the time of his death. Dr. Corey wrote *Reminiscences of Thirty Years' Labor Among the Colored People of the South*.

CORN. The following table, published by the Department of Agriculture, division of statistics, shows the acreage, production, and value of corn in the United States in 1899:

States and Territories.	Acreage.	Average Yield per Acre.	Production.	Average Farm Price per Bushel Dec. 1.	Farm Value December 1.
	<i>Acrea.</i>	<i>Bushels.</i>	<i>Bushels.</i>	<i>Cents.</i>	<i>Dollars.</i>

A few countries besides those enumerated in the table produce corn, but statistics therefor are not available, and from a commercial point of view are not important, since the product of these countries is entirely for domestic consumption. Among these are Central America, the South American republics, except those named above, and India. The crop of Central America is probably considerably larger than that of Cape Colony. The acreage under corn in British India is between 5,000,000 and 6,000,000 acres, but the yield is unknown.

CORNELL UNIVERSITY, at Ithaca, N. Y., began its work in 1868. On January 9, 1899, President Schurman was asked by President McKinley to accept the chairmanship of a commission to visit the Philippine Islands, and Professor T. F. Crane was elected by the board of trustees to perform the duties of president of the university during his absence. President Schurman returned August 21, 1899. The year was chiefly notable for the organization and opening of the following new colleges and departments: The Medical College in New York City, opened October 4, 1898, with 278 students, of whom 26 were women, and a staff of 71 instructors. There were classes in each of the four years of the course, and at the first annual commencement, June 7, 1899, 76 students were graduated, 11 of whom were women. The new Medical College building on First Avenue, opposite Bellevue Hospital, being erected by the munificence of Colonel Payne, has been at a standstill on account of the scarcity of steel. The number of students in attendance at the university was considerably increased by the opening of the Medical College. The New York State College of Forestry entered upon its first year of existence with 31 students. The college forest of 30,000 acres, bought by the Forest Preserve

Board for \$165,000, was transferred to the college April 1, 1899. It is located near Tupper Lake station. For the inauguration of the work and improvements in the college forest a working capital of \$30,000 has been granted. The infirmary, the gift of Dean and William H. Sage, opened on September 30, 1898, fully equipped for receiving patients, and 184 were admitted during the year. The departments of hydraulic engineering and railway mechanical engineering were also opened during the year. Another important feature was the establishment of a summer session of the university, taking the place of the summer school formerly held under the management of individual professors and instructors. During the year 12,456 volumes were added to the general library, of which 3300 were gifts. Ex-president White added 866 volumes to the White Historical Library, and the Law Library was increased by 1058 volumes. An extensive addition to Morse Hall and an enlargement of Sage Chapel were completed during the year. For statistics see UNIVERSITIES AND COLLEGES; see also PSYCHOLOGY, EXPERIMENTAL; and FORESTRY.

CORREA, Lieutenant-general M., Spanish soldier and statesman, died in Madrid, April 18, 1899. He was minister of war in the Sagasta cabinet during the Spanish-American war, and resigned his office in October, 1898. He became chief of the Queen Regent's military household, which position he held at the time of his death. At the outbreak of the war in the spring of 1898 he delivered a bombastic speech, extolling the prowess of the Spaniards and predicting American defeat.

COSTA RICA, the most southern republic of Central America, lying between Nicaragua and the South American republic of Colombia and the Caribbean Sea and Pacific Ocean. The capital is San José.

Area, Population, and Education.—The country comprises five provinces and two territories, the total estimated area of which is 23,000 square miles, and the population (1897) 294,940. Very few of the rural inhabitants are of pure European descent. The principal towns with approximate populations are: San José, 25,000; Cartago, 12,000; Alajuela, 10,000; Puntarenas, 8000; Heredia, 6050; Liberia, Santa Cruz, and Nicoya, each 5000; Limón, 4000. Immigration is encouraged by the government; the annual number of immigrants is about 1000, greater than that to any other Central American country. A boundary dispute with Colombia has been submitted to the arbitration of the president of France. There has also been a boundary dispute with Nicaragua.

Roman Catholicism is the state religion, but the principle of religious liberty prevails. There are few non-Catholics in the republic; in 1892 there were reported 2245 Protestants and 224 Buddhists. Public instruction is gratuitous, and not only nominally, but actually compulsory, the latter being an unusual state of affairs for a Latin-American country. Besides five institutions for higher education there are (1897) 327 primary schools, with an attendance of 21,913 pupils.

Government.—The constitution, adopted in 1870 and thereafter repeatedly amended, places the chief executive authority with a president, who is chosen by electoral colleges for a term of four years, and is assisted by a cabinet of four ministers, who direct the following departments: The interior; finance and commerce; foreign affairs, justice, education, and worship; and war and marine. The president is Señor Rafael Yglesias, who was re-elected in November, 1897. The legislative power devolves upon a house of representatives, the members of which are chosen by electoral colleges in the proportion of one representative for each 8000 inhabitants. Members of electoral colleges are chosen by popular vote; self-supporting citizens are legal voters. Besides local magistrates and inferior courts, there are a court of cassation, two appellate courts, and a supreme court.

Military service may be required of men between the ages of eighteen and fifty. The national militia is said to number 12,000 and the regular army in time of peace 600; the war footing is placed at 34,000. The government owns one gunboat and one torpedo boat.

Finance.—Customs and excise constitute the chief sources of revenue; the principal expenditures are for administration and the public debt. For the fiscal year 1897 the revenue and expenditure were 7,435,611 pesos and 6,697,327 pesos, respectively; for the fiscal year 1898 the revenue was 8,424,104 pesos and the expenditure 8,313,454 pesos. A later report, however, made by the president of the republic, placed the revenue for that year at 8,413,198 pesos and the expenditure at 8,060,655 pesos; according to the same authority, the revenue for the fiscal year 1899 was 8,424,103 pesos. The president also said that the financial condition of the country was not in a satisfactory condition. In 1898 the total foreign debt was \$10,194,270; the internal debt in 1897 was 1,116,784 pesos. Amortization of the foreign debt at the rate of \$48,660 (£10,000) annually will begin in 1917; the internal debt is under process of redemption. The par value of the peso is \$.9732 United States currency;

the paper peso is worth about \$0.446. The Costa Rican government in October, 1896, determined upon the gold colon as the monetary unit, but the plan was not put into immediate operation. The congress by enactments of June 24, 1899, authorized the executive to negotiate a private loan not exceeding £200,000 (\$973,200), to be converted into the national gold coin. This coin, the colon, is valued at \$0.465. As security for this loan there were offered 60,000 ordinary shares of the Costa Rican Railway, owned by the nation. In 1896 there was a specie reserve of 1,250,000 pesos for a paper circulation of about 3,300,000 pesos. Circulating silver amounts to about 350,000 pesos.

Industries and Commerce.—The principal industry is agriculture, the two most important crops being coffee and bananas. The soil and climate are such as to allow the cultivation of almost any crop. The cacao and rubber industries are progressing and the rearing of cattle is important. The live stock in 1897 was valued at 12,695,065 pesos. Parts of the country are rich in gold, and silver also exists. Recently mining was said to have fallen off to a great extent, but in 1899 it was announced that gold exploitation was being carried on by several companies controlled by English, American, and French capital. In some mines improved modern methods obtain.

Coffee is by far the most important export; other exports are bananas, hides and skins, and cabinet woods. Cotton goods and other textiles and iron goods constitute the leading imports. In 1896 the imports and exports, gold valuation, amounted to 4,748,818 pesos and 5,979,727 pesos, respectively. The export of bananas began in 1880 with the shipment of a few hundred bunches, and in 1899 had increased, it is said, to about 3,000,000 bunches a year; the export for 1898 was reported to be 2,331,036 bunches. In 1894, 33.64 per cent. of the total imports came from the United States; in 1898, 44.8 per cent. Of the coffee export, about 80 per cent. is sent to Europe, 56 per cent. going to England. Of the "fine grades," there were exported in 1898, 18,329,263 kilograms, of which England received 10,821,076 kilograms; the lower grades aggregated 1,156,862 kilograms, and the value of the whole export was \$4,209,569 gold. The imports and exports, gold valuation, for the year ending March 31, 1899, amounted to \$4,258,896 and \$5,659,218, respectively. The exports were divided as follows: Coffee, \$4,209,569; bananas, \$923,090; timber and dyewoods, \$345,439; precious metals, \$48,788; various exports, \$132,332. Of the coffee, Great Britain took 56 per cent.; the United States, 20 per cent.; Germany, 16 per cent.; about two-thirds of the bananas went to New Orleans and the remaining third to American Atlantic coast ports. The percentages of the imports by countries for 1898 were: United States, 44.8 per cent.; Great Britain, 19.6 per cent.; Germany, 15.6 per cent.; various, 20 per cent. According to a message of the president in 1899, exports and imports in United States gold have been as follows:

	1895.	1896.	1897.	1898.
Exports.....	\$5,188,401	\$5,597,727	\$5,474,773	\$5,659,218
Imports.....	3,851,460	4,748,812	5,460,944	4,258,896

Three steamers of 600 tons and two sailing vessels of 551 tons comprised the merchant marine in 1898. The arrivals at the ports of Limon and Puntarenas in 1896 were 476 vessels, aggregating 471,125 tons, and the clearances, 475 vessels of 473,929 tons. These vessels were British, United States, and German.

Communications.—The Caribbean port Limón is connected by rail with Alajuela, and the Pacific port Puntarenas with Esparita; the former line is 117 miles in length and the latter 14. A line connecting the inland terminals is under construction; also a railroad about 59 miles in length from San José to the proposed port of Tivives, at the mouth of the Gulf of Nicoya, is under construction. In 1899 the first electric tramway in Central America was built in San José, and other lines connecting the capital of neighboring towns were projected. In 1897 there were 917 miles of telegraph lines, with 43 offices; in the same year the post-offices numbered 83.

The only important seaport on the Atlantic coast is Limón, but on the Pacific there are several excellent harbors. The only one of the latter, however, that is at present frequented by foreign shipping is Puntarenas. Considerable improvements are being made to the harbor of Limón, and the expenditure therefor being incurred by the government. Near the close of 1899 the amount expended was reported to be about \$765,000. It is expected that the improvements will render Limón one of the most healthful ports in Central America. The work is being directed by an American contractor.

A Revolutionary Movement.—On February 25, 1899, an unsuccessful attempt to overthrow the existing government was made at San José by a small band of men under the leadership of a certain "General" Velarde. The insurgents were admitted

to the artillery barracks by Velarde's son, a lieutenant in the army. After some sharp firing, during which several were killed and wounded, the rebels were repulsed. Many arrests were made, but the elder Velarde escaped.

COSTELLOE, BENJAMIN F. C., M.A., B.Sc., who died December 22, 1899, was a distinguished social reformer in England, and a pioneer of improved government for London. He was born in Ireland in 1855. His career had been notable from his school days. After graduating at Glasgow University, he entered Balliol College, Oxford. Later he became a university settler in the east end, where he worked unremittingly for the improvement of the tenement dwellers. He next helped to form the National Vigilant Association, an organization subjected to bitter criticism, but which succeeded in effecting many social reforms in London. He was elected to the first London County Council, of which he was a member until his death, and he was especially active during 1899 as a member of the important local government committee of the council. He was for several years a member of the executive committee of the London Liberal and Radical Union, and principal editorial writer for the *Daily Chronicle*. He was always closely identified with the movement for taxation of ground value. He was a Liberal candidate in 1885 for East Edinburgh, and later for East St. Pancras, but was unsuccessful in these political endeavors.

COTTON AND THE COTTON INDUSTRY.* The commercial crop of cotton in the United States for the season of 1898-99 was 11,256,000 bales, averaging 513 pounds (gross weight) per bale, against a crop of 11,216,000 bales, averaging 507 pounds per bale (gross weight) for the previous season. The figures are given by States in the accompanying table, together with the acreages. The corresponding figures for India are 15,612,000 acres for 1898, and 15,471,000 acres for 1899; and 2,534,000 bales of 400 pounds for 1898, and 2,787,000 for 1899. The acreage for Egypt is given as 1,350,000 in 1897-98, and 1,450,000 in 1898-99. The production is not given for Egypt, but the shipments from Alexandria were 843,000 bales in 1897-98 and 736,000 in 1898-99. The average price of middling upland cotton in New York for the season was about 6 cents per pound, being $\frac{1}{4}$ cent less than in the previous season. Mr. Thomas Ellison, of Liverpool, estimated British consumption for the year ending September 30, 1899, as 3,519,000 bales, of 500 pounds net, and continental consumption as 5,086,000 bales, of 500 pounds net, the latter being 208,000 bales more than the previous season. United States consumption for the season ending August 31, 1899, is estimated as 3,582,000 bales, of 500 pounds net, being 660,000 bales more than for the year before. Of this increase, 447,000 bales were consumed in the Northern mills, and 213,000 bales in the Southern mills. This large increase is due both to the greater number of spindles in operation, and to the fact that the mills of the country were worked to their full capacity for most of the time. The cotton mills of India consumed during the year ending June 30, 1899, 1,675,000 bales, of 392 pounds, being 104,000 bales more than the previous year. The cotton-consuming countries of the world from which reliable statistics are obtainable have consumed 1,110,000 bales, of 500 pounds net, more than during the previous season.

Estimated cotton acreages and crops, in bales, for the seasons 1897-98† and 1898-99‡. (Compiled from Cotton Facts, by A. B. Shepperson.)

The figures do not include about 250,000 bales of cotton now grown annually in the Asiatic provinces and used in Russian mills; nor about 325,000 bales (500 lbs. net) spun by hand machines in India; nor the small quantity of Egyptian and Peruvian cotton used in the United States.

The cotton manufacturers of Great Britain and the United States have had the most prosperous and profitable season for years. The wages of operatives in the New England mills have very recently been advanced 10 per cent. Northern and Southern mills alike are running full time, and in many cases overtime. On the continent, while the volume of business has been larger than ever before, the profits have been only fairly satisfactory. The number of spindles in operation is as follows: Great Britain, 45,400,000, being 500,000 more than last season; the continent, 32,500,000, or 1,150,000 more; the United States, 18,100,000, or 650,000 more; India, 4,728,000; making a total of 100,728,000 spindles in operation for the countries named. Detailed figures by countries and years for spindles at work in cotton mills and amount of cotton consumed are given in the accompanying table. During the first few months of last season cotton goods were lower in this country than ever before, but since December 1, 1898, prices have steadily advanced, until they are now about 50 per cent. higher than the lowest figures. During the year ending June 30, 1899, the exports from the United States of cotton cloths were 412,004,055 yards, against 270,507,818 yards for the previous fiscal year, being an increase of 52 per cent. The increase in value of these exports is practically made up of the increase to China, Cuba, Hawaii, and Puerto Rico. As usual, the bulk of the exports was uncolored cotton cloths, the division for the year 1899 having been as follows: Colored cloths, 108,-

940,972 yards, valued at \$5,221,278, and 303,063,083 yards of uncolored cloths, valued at \$13,748,619. The comparative total exports for 1897-98 and 1898-99, showing cloths and all other cotton manufactures, and also countries to which the goods were sent, are given in the accompanying table:

Quantities and values of annual exports from the United States of cotton goods of domestic manufacture, by countries, 1897-98 and 1898-99. (Compiled from reports of United States Treasury Department for *Cotton Facts*, by A. B. Shepperson.)

Advices sent late in December indicate a commercial crop of about 9,500,000 bales from the Southern States for the season 1899-1900, a falling off of from 10 to 25 per cent. from last year's crop. In India there is also a great shortage. A prominent Bombay firm reports, November 17, 1899, that the receipts into Bombay thus far are estimated at only 840,000 bales, against 2,079,000 bales for the preceding season. Few of the Indian mills are working more than four days out of the seven for lack of cotton. The Egyptian crop, however, will be about 100,000 bales more than last season. An examination of the progress of cotton manufacture in the leading countries of the world (see table) will show a marked growth in our Southern States and in India. The increase in the Southern States may be accounted for, in part, by the following advantages possessed by them: Proximity to the cotton fields, saving cost of transportation; comparative cheapness of land, material, fuel, and labor; length of working day. The chief significance of the increase in India is the fact that just as the consumption of the Indian mills increases, the quantity of the cotton crop left for export to Europe is diminished, thus making European spinners more dependent on American cotton. Perhaps the most suggestive feature in the figures is the fact that the greatest relative increase in cotton manufacturing is in the localities where the cotton plant is grown. Eventually the mills near the cotton fields seem likely to manufacture practically all except the higher grades of yarns and goods. The percentage of increase in consumption of cotton by the mills was uniformly greater than the percentage of increase in spindles. This difference is especially marked in Great Britain, where the mills show an increase in consumption of 16½ per cent., while the number of spindles has increased only 4½ per cent. The difference is due to the greater efficiency of modern spindles and machinery, and the great extent to which new and improved machinery has been substituted for old. It should be added, also, that the British mills now manufacture, on the average, finer yarns and goods than formerly, and that therefore their progress is relatively better than would be indicated by comparison with other countries in the accompanying tables.

* Includes \$12,168 of cloths, and \$11,715 of other manufactures to Cuba; and \$2206 of cloths and \$1678 of other manufactures to Puerto Rico.

† Includes \$447,539 of cloths and \$112,580 of other manufacture to Cuba; and \$169,067 of cloths and \$38,263 of other manufactures to Puerto Rico.

‡ Includes \$104,575 of cloths and \$256,804 of other manufactures to Hawaii; and \$1304 of cloths to the Philippines.

§ Includes \$140,719 of cloths and \$324,206 of other manufactures to Hawaii; and \$1895 of cloths and \$1887 of other manufactures to the Philippines.

The manner in which American cotton is generally baled and pressed for transportation to the markets and mills is not only needlessly expensive and wasteful, but fails to protect the cotton from damage and theft. The bales are covered with jute cloth made of thread so coarse and loosely woven that while it adds unnecessarily to the weight of the bale, it does not protect the cotton. The bales are held together by steel bands, which still further increase the weight. The weight of the bagging and ties on a bale weighing 500 pounds is about 23 pounds. From the inflammable character of the bagging and the cotton itself when packed in the usual way, and the constant risk of fire from the friction of the steel bands on the bales, some of the passenger steamships refuse to carry cotton, and such exclusion of course tends to raise the freight rate on cotton. Other disadvantages of the common method of baling cotton are: High insurance rates, the square bales being classed as "extra hazardous;" the necessity of the bales being compressed a second time (usually at the nearest shipping point), so that a greater number of bales can be loaded in cars and vessels, this process involving many additional incidental expenses, such as drayage and storage; the excessive cost of handling the ordinary bulky bales at the mills. Two improved methods of baling cotton are in use. The American Cotton Company puts up cotton in cylindrical bales, 35 inches long, 22 inches in diameter, and weighing 270 pounds. They are covered with closely woven, light weight burlap, the weight of the covering being less than $2\frac{3}{4}$ pounds per bale. No bands or wires are used to secure the bales, for as the air has been pressed out of the cotton in putting up the bales, there is no more tendency to expand in any direction than there is in a roll of carpet. It is simply a continuous lap or roll of cotton. The cylindrical bale of the Planters' Compress Company is 36 inches long, 18 inches in diameter, and weighs 250 pounds. This bale is held together by wires passing from end to end through a small opening in the centre. It is covered with cotton duck, and the weight of the cloth and wire is about 3 pounds per bale. Most satisfactory tests have been made with each of these types of bales to show their power of resistance to fire. The other objections to the old-fashioned methods of baling are also obviated by the cylindrical bales described. Several other methods of baling cotton have been devised, but have not yet passed the experimental stage.

COTTON, Sir ARTHUR THOMAS, British general, retired, died July 24, 1899. He was born in 1803; was educated at Addiscombe College, and in 1819 entered the Madras Engineers. He first saw active service in the field in the first Burmese war, which ended with the capture of Rangoon. In 1854 he was promoted to the rank of colonel; in 1861 he was knighted for his services in developing the cotton industry of India, and in 1866 was created a knight commander of the Star of India. He became a general in 1876, and in the following year was retired.

COUES, Dr. ELLIOTT, American scientist, and former army officer, who died December 25, 1899, was one of the foremost ornithologists of the United States. It has been said that his *Key to North American Birds*, which has gone through many editions, and his check-list of birds were, with *Ridgeway's Manual*, as important contributions to ornithology in many ways as were the analytical field-book by Gray in botany and the hand-books by Dana in mineralogy and geology. He was born at Portsmouth, N. H., in 1842, and graduated from the academic department of Columbian University in 1861 and from its medical department ten years later. After graduation his alma mater conferred upon him the degrees of A.M. and Ph.D. His scientific life began in 1862, when he entered the United States Army as a medical cadet. He soon became assistant surgeon, which remained his rank thereafter. Wherever his army duties called him, he made exhaustive studies of the fauna and flora of the region. Several scientific papers resulted from his residence in Arizona and South Carolina. In 1873-75 he did considerable field-work while surgeon and naturalist to the United States Northern Boundary Commission, after which he was appointed to the Smithsonian Institution. In 1876 he became naturalist to the United States Geological and Geographical Survey of the Territories. In 1880, Dr. Coues was ordered to the frontier by the War Department, but he had become so deeply interested in scientific work that he resigned from the army and returned to Washington. He was at various periods professor of scientific subjects in several colleges, and was a member of the National Academy of Sciences. He was at one time interested in the investigation by scientific methods of the phenomena of spiritualism and telepathy. The results appear in a series of speculative works written on the origin and nature of life. The range of Dr. Coues's literary life was very great. He was the author of thirty-seven volumes and over a thousand articles to magazines and periodicals. One of his most important labors of recent years was his work for the *Century Dictionary*, to which he contributed some 40,000 definitions and words, in general biology, comparative anatomy, and all branches of zoology. He served six different scientific journals in editorial capacities, and his name was on the rolls of more than fifty foreign and American scientific societies. He was one of the founders of the

American Ornithological Union. His chief books are: *The Key to North American Birds*; *Check-List and Dictionary of North American Birds*; *Field Ornithology*; *Birds of the Northwest*; *Fur-Bearing Animals*; *North American Rodentia*; *Birds of the Colorado Valley*; *New England Bird Life*; *Biogen*; *The Dæmon of Darwin*; *Kuthumi*; *Can Matter Think? Buddhist Catechism*; *A Woman in the Case*; *Signs of the Times*; *Citizen Bird*. He also edited many papers, among them being *The Travels of Lewis and Clark*.

COWEN, FREDERIC HYMEN, who succeeded Sir A. C. Mackenzie as conductor of the London Philharmonic in 1899, is a well-known English composer. He was born in Kingston, Jamaica, in 1852. He studied under Sir Jules Benedict and Sir John Goss, and also in the conservatories of Leipsic and Berlin. In 1880 he became conductor of the Covent Garden Promenade Concerts; was conductor of the Philharmonic from 1888 until 1892, and in 1896 became conductor of the Manchester and Liverpool Philharmonics. His compositions include: *The Rose Maiden*, cantata, 1870; *The Corsair*, cantata, 1876; *Pauline*, opera, 1876; *The Deluge*, oratorio; *Saint Ursula*, cantata; *Sleeping Beauty*, cantata; *St. John's Eve*, cantata; *The Water Lily*, cantata; *Ruth*, oratorio; *Signa*, opera, Milan, 1893; *Harold*, opera, London, 1895; *The Transfiguration*, cantata; suites for orchestra. *The Language of Flowers* and *In Fairyland*; *Dream of Endymion*, scena for tenor; several symphonies, including *The Scandinavian*; *Ode to the Passions*, 1898; more than 250 songs, and numerous piano pieces and chamber music. Mr. Cowen visited Canada in 1899. In that year he was made president of the Northwest London Choral Society, founded in 1899, to study little-known works.

COX, ROBERT, M.A., Liberal Unionist member of Parliament, died at Aix-les-Bains, France, June 2, 1899. He was born at Edinburgh, May 6, 1845; was educated at Loretto School and at the universities of St. Andrew's and Edinburgh. Subsequently he became a well-known manufacturer in Edinburgh. From 1891 to 1895 he was vice-president of the Edinburgh Philosophical Institution; from the latter year to the time of his death he represented South Edinburgh in Parliament. Mr. Cox took a lively interest in open-air sports, and will be remembered by the golf players of America for presenting to the United States Golf Association the one-thousand-dollar silver and enamel cup for the women's golf championship of this country.

CRAMP, CHARLES HENRY, who was made president of the Philadelphia Commercial museums in 1899, was born May 9, 1828. He is the son of William Cramp, the ship-builder. He was graduated at the Central High School, and, learning the ship-building trade, became a partner of the firm of William Cramp and Sons, of which he is now president. This is the largest ship-building enterprise in this country.

CRANE, WALTER, painter, poet, and authority on decorative art, was born in Liverpool, England, August 15, 1845. He is the son of Thomas Crane, the artist, and was educated privately. In 1859 he was apprenticed to W. J. Linton, the wood-engraver, and in 1863 published *The New Forest*, the first of a long list of illustrated books, including *The Baby's Opera*, London, 1877; *The Baby's Bouquet*, 1879; *Pan-Piper*, 1882; *Grimm's Household Stories*, 1882; *the Sirens Three*, a poem, 1885; *Baby's Own Æsop*, 1886; *Flora's Feast*, 1889; *Queen Summer*, 1891; *Spenser's Faerie Queene*, 1895-97; *The Shepherd's Calendar*, 1897, and *The Bases of Design*, 1898. Mr. Crane is a member of various artistic societies in London, and in 1899 was one of the founders of the Pastel Society. He was associated with William Morris in his socialistic propaganda, and was the first president of the Arts and Crafts Exhibition Society, which post he still holds. Mr. Crane is examiner in design at South Kensington, and is an ardent advocate of a national institution of art. His principal pictures are: "The Renaissance of Venus;" "Fate of Persephone;" "Europa;" "Freedom;" "The Bridge of Life;" "Neptune's Horses;" "The Swan Maidens;" "La Belle Dame sans Merci;" "The Chariots of the Hours;" "England's Embellish;" "Britannia's Vision," and "The World's Conquerors."

CRANFORD, JOHN WALTER, representative from Texas, fourth district, in the Fifty-fifth Congress, died in Washington, D. C., March 2, 1899, in his thirty-seventh year. Born in Clark County, Ala., and educated in the high schools and privately, he removed to Texas about 1880, studied law, and was admitted to the bar. He was elected in 1888 and re-elected in 1892 to the State senate, serving for a time in that body as president *pro tem*. Cranford was elected to Congress, as a Democrat, in November, 1896, defeating Mr. J. H. Davis, Populist, and Mr. M. W. Johnson, Gold Democrat.

CREMATION OF THE DEAD. During the year 1899 several English municipalities have taken parliamentary powers to provide for public cremation, and in March, 1899, the corporation of Hull, England, was building a crematorium. Mayor

Quincey, of Boston, has suggested that a municipal crematory be established in which to incinerate the bodies of paupers and criminals, thus doing away with the Potter's Field. It is asserted that the city could cremate bodies at a cost of \$1 each, against \$3 to dig a grave. The public burials in Boston now amount to about 500 annually, and the Potter's Field is full.

In Paris cremation is compulsory for certain classes. In the furnace erected by the city in Père-la-Chaise, the city burns all unclaimed hospital dead, remains from dissecting tables, and dead bodies from streets and sewers. Berlin has a municipal furnace for disposing of parts of the human body, but they must be unidentifiable.

The accompanying table shows the rapid growth, both in numbers and in the use made of each, of private crematories in the United States, up to the close of 1898:

TABLE OF CREMATIONS IN THE UNITED STATES, 1876 TO 1898.

(Compiled by the United States Cremation Co. of New York.)

Later figures for a few of the cities named in the table are as follows: During the first nine months of 1899 the Massachusetts Cremation Society burned 173 bodies at its crematory at Forest Hills. Of the decedents 90 were males and 83 females; 63 died in and 110 outside of Boston. The number of burial permits issued by the Board of Health of the city was 8976, against 63 permits for cremation. At Fresh Pond (New York City), 528 bodies were cremated during 1899, making a total of 3301 for the 25 years of the crematory's existence. The Philadelphia Cremation Society was organized in 1887 and incorporated in 1899. Over 100 cremations were made during 1899. The charge for cremation is \$35 for adults at both Philadelphia and New York; \$20 for children under 12 years at Philadelphia, and \$25 for children under 10 years at New York.

The objections to cremation are chiefly (1) religious and sentimental, (2) medico-legal. A large part of the clergy, including the Pope of Rome, are opposed to cremation. Custom and tradition are against the practice. Many prominent clergymen and public teachers, however, have recently declared in favor of this method, thus greatly modifying the prejudice against it. The medico-legal objection is that with incineration possible evidences of crime may be destroyed. The Cremation Society of England has met this objection by investigating the conditions of death in the case of everybody for whose incineration application is made, and has further secured the services of a distinguished pathologist for making necropsies when required. The chief arguments in favor of cremation are: (1) The crowding of the land, especially in and near large cities, with cemeteries. It has been estimated that 24 acres are annually required for the disposal of the dead of London. (2) Sanitary considerations. Sir Henry Thompson, in a recent address before the Cremation Society of England, contends that cremation, while remaining optional in case of

ordinary causes, should be obligatory where death is due to such transmissible diseases as small-pox, scarlet-fever, diphtheria, cholera, typhoid-fever, and tuberculosis.

CRETE, one of the largest islands of the Mediterranean Sea, lies to the south of the Ægean Sea and archipelago. It is about 150 miles long and from 6 to 35 miles in breadth, and its estimated area is about 3000 square miles. The character of the country is mountainous. The population of Crete has been placed at from 294,000 to 370,000 inhabitants, of whom the great majority are Greek Christians. The remainder, mostly Mohammedans, number about 70,000. The lower grounds of the island are fertile, and produce fruits, tobacco, cotton, silk, etc. The principal cities are Candia (population 25,000), Canea (population 15,000), and Retimo (population 9000).

Political Conditions.—Crete, the Cuba of the Mediterranean Sea, looked back, on December 21, 1899, after centuries of oppression, conquest, and civil war, upon the first year of freedom, under the rule of Prince George of Greece, the appointee of the four great powers, Great Britain, France, Russia, and Italy. The similarity between Cretan and Cuban affairs is quite close. Crete had long been an unhappy country, and the sympathy of Greece, although born in part by a race relationship with many of the island's inhabitants, was otherwise not unlike the feeling in America regarding Cuba. The intention of Greece in the Greco-Turkish war had been the annexation of Crete, while the United States had expressly stated an opposite intention as to Cuba; but the inhabitants of Crete were on the whole willing and in large numbers anxious to become the subjects of the Grecian king. In both Cuba and Crete years of misrule and of war have affected the character of the people. A large number of the Cretan people are ignorant and fanatical, and have grown quarrelsome through years of knowing no better state of affairs. In addition there are strong religious prejudices among the population, which have played an important part in the various troublesome times of the land. The powers interfered even before the Turkish war, to prevent the Grecian annexation of Crete, announcing that they themselves would be responsible for order in that island. When the time came jointly to appoint a high commissioner for Crete, Prince George of Greece was nominated, and his acceptance formally authorized by his father, the King of Greece. He took his office on December 21, 1898. While acknowledging the suzerainty of the Sultan of Turkey, he was to organize an autonomous government in co-operation with the general assembly, guaranteeing freedom of religion and security of life and property, and establishing a gendarmerie. Each of the four powers agreed to advance \$200,000, to be afterward repaid by the Cretan government. His rule during 1899 was consistent and even-handed, and resulted, in spite of the many difficulties in the way, in the best and most popular government that Crete has yet had.

Events Preceding the Reconstruction.—For twenty-five centuries, from the rule of the kings of mythology to modern times, Crete has been known as the seat of conquest and oppression. The island was held by the Romans long before the time of Christ, and on the division of the empire fell to the control of the East. It belonged subsequently to the Saracens, Pope Boniface, the Venetians, and others, and in 1669, after twenty-four years of war, was taken by Turkey. The island has never been entirely subdued to Turkey and revolutions have been frequent. In consequence of these, since 1868 various reforms have been forced from the Sultan, securing in form a fair degree of self-government to the island. The bad faith of Turkey in carrying out these reforms caused increasing discontent among the Christians, who enlisted the aid first of England and then of Greece. The latter, in 1897, during much fighting and disturbance stirred up among the Mohammedans by the Sultan, landed a force in the island. The interference of the powers caused the withdrawal of Greece. Then followed the fearful Moslem massacre of Christians, the collective note to the Sultan signed by Great Britain, France, Russia, and Italy, and the withdrawal of the Turkish troops. Soon after the appointment of Prince George was announced as high commissioner of Crete for three years.

Crete under Prince George.—The ability and enthusiasm of Prince George were wholly devoted during the year 1899 to the unique work of reconstructing the social and political affairs of Crete, and the results of these first twelve months are reported to be beyond expectation. He began his administration with the support of the great majority of Cretans, who felt themselves for the first time united in a common cause, under the rule of a governor of their own race and language. He was aided also by the prestige of the powers, to whom alone he is responsible, though under the nominal suzerainty of the Sultan. Thirdly, it is said, his personal attractions and his royal status and nationality, creating the Cretan hope of ultimate union with Greece, have contributed no small part toward the possibility of a strong and successful government. On the 7th of January a commission of 16 members, of whom 12 were Christians and 4 Mussulmans, was appointed to draw up a plan for a constitution. In the following week the Prince nominated a judiciary commission

composed of 4 members, including 3 Christians and 1 Mussulman, to draw up civil and penal codes. The chamber of deputies was assigned on the 5th of February. The newly drafted constitution was submitted to the national assembly, by which it was approved and passed, March 16, 1899. On February 22 the assembly had elected M. Sphakianaki as president. The government was empowered in April to raise a loan of 9,000,000 drachmas, on condition that the interest, with the help of the powers, should not exceed 3 per cent. Immediately afterward an administration consisting of a council of five members was formed. Early in May it was announced that the Italian government had provided 6 officers and 86 non-commissioned officers to organize the Cretan gendarmerie. The administrative council was formed as follows: Justice, M. Venezelo; interior, M. Kountoros; education and religion, M. Yamalaki; finance, M. Fournis; posts, telegraphs, and public safety, Hassan Bey Skylianaki. The financial advisor of the high commissioner, H.H. Prince George of Greece, is M. de Blovay. The task of securing for Crete good government and peace, after the years of misrule which have but just closed, finds among its chief difficulties the local religious conditions and the fierce intersectional jealousies, subjects already referred to in the introduction to this article. Foreign critics are not yet at all hopeful of permanent peace in the island, but the past year seems to show that a way has been found to overcome many of the causes which have hitherto promoted turmoil. Prince George in his inauguration speech called upon the patriotism of the people in forwarding the experiment of autonomy made possible by the powers, and in promising a just and liberal government he emphasized the impossibility of restoring peace to Crete without obedience to law and the cessation of quarrels about race and religion. His impartial rule has had its effect, and many Mohammedans even, especially those in the towns, and the rich land-owners, have recognized the sincerity of his efforts and have come to his support. He has not as yet been entirely successful with the bulk of the Mussulman minority, who have been induced, under the influence of secret agents of the Sultan, to emigrate in large numbers to Asia Minor, where they might live entirely under Moslem rule. Many of these had been driven from their homes in Crete during the period of unrest following the massacres, and they evidently doubted the good faith of Prince George in his statements that they should enjoy full equality with their Christian neighbors. As many as 30,000 abandoned Crete, although some of these are returning as they see the growth of order and good government in Crete. Meanwhile those still in Asia Minor are making trouble for Turkey, where they are clamoring for food and employment. A danger in connection with the movement is the suggestion by the Russian government to settle the Armenian refugees, who have been driven out by Turkey, in the localities formerly occupied by the Moslems in Crete. As the Greeks hate the Armenians, such a movement might result in further disorders in the island. See *ARCHÆOLOGY* (paragraph Greece).

CRICKET. The event in cricket circles for the United States in 1899 was the visit to this country of Prince Ranjitsinhji, the foremost cricketer of to-day, with a team of English amateurs. Next to the tour of the all-English team, one of the most interesting series of games was the annual United States-Canadian match. For a detailed account of these English and Canadian games see *SPORTS, INTERNATIONAL*. Philadelphia continues the stronghold of cricket in the United States. The Halifax Cup, representing the cricket championship of this country, was contested for by the principal Philadelphia clubs, and was secured by the Germantown team, with 12 won games out of 16. The standing of the other teams was: Merion, 6 games out of 10; Belmont, 6 out of 10; Philadelphia, 4 out of 11; Radnor, no victories. In the Metropolitan District (New York) League, cricket continued to develop. The summaries are: Knickerbocker Athletic Club (team A), 8 out of 10, 1 drawn; team B, 7 out of 10, 1 drawn; Manhattan, 5 out of 10, 2 drawn; Staten Island, 4 out of 10; New York, 4 out of 10; Newark, 0 out of 10. The pennant of the New York Cricket Association was won by Paterson, team A, 8 out of 10, 2 drawn. In these games, each playing 10, Kearny won 5, Brooklyn 4, Manhattan 2, Kings County 2, and Paterson, team B, 2. Manhattan had 4 drawn games, and the others 2 each. The Intercollegiate Cricket Association, composed of Harvard, Pennsylvania, and Haverford, gave the championship to Harvard again. The winner defeated Pennsylvania 91-35, and Haverford 96-38. Cricket developed greatly in 1899 on the Pacific coast.

CRIME. *The United States Census and Crime.*—Prior to 1850 no statistics of crime or prisoners appeared in the census. In 1850 the enumerators were required to ascertain whether the person counted was blind, insane, deaf and dumb, idiotic, a pauper, or a convict, and the population schedule in 1850 was substantially repeated in the census of 1860 and 1870, which therefore provided for statistics as to the number of prisoners. The returns as to convicts who were not inmates of penal institutions were necessarily defective, and the statistics collected in regard to the inmates of

such institutions were not tabulated. So the statistics of prisoners for the censuses previous to the year 1880 were not available from this source, and those which we have are based on the schedule of social statistics, one of whose questions was the number of prisoners in the locality. The vagueness of this question, which might include only persons convicted of crime or all inmates of penal institutions, even those awaiting their trial, rendered the prison statistics of the census previous to 1880 practically worthless. In 1880 the census provided for the collection of data not only as to the number of prisoners, but as to the cause of imprisonment, the nature of the offence, and the length of the sentence. In 1890 the statistics assumed a still wider scope, and the criminal schedule contained questions relating to occupation while in prison, employment at time of arrest, degree of education, residence, health, and use of alcoholic liquors. The statistics of prisoners in that census took up 511 pages of general tables. The treatment of crime in the Eleventh Census has been criticised by a recent writer on the following grounds:

- "1. It furnishes no basis for a calculation of the increase of crime.
- "2. In depicting the geographical distribution of crime, it favors one locality at the expense of another.
- "3. It exaggerates the number of male sex in the aggregate of crime.
- "4. It assigns to the negroes a larger, and to the foreign-born white a smaller, share in the total of crime than belongs to each.
- "5. It distorts the picture of the relative frequency of the different classes of crime."

The tabulation is criticised as wasteful in that it records a superfluous number of facts in regard to a comparatively small number of cases, and sometimes to a single case. It is criticised as defective in noting the occupations of prisoners prior to arrest. It summarizes them by groups which do not accord with the occupation tables of the census. These tables include data for which no data are given in regard to the general population, and this in the circumstances is of no use for purposes of comparison. A more serious defect is the grouping of certain phenomena according to the percentage of the total number of prisoners, and not according to the percentages of the corresponding classes in the population. An example which has been given of this is that in comparing the proportions of male and female prisoners, the latter are relatively more numerous in the higher age groups, which would seem to indicate a greater tendency on the part of women to commit crime as they advance in age, whereas the greater proportion of women to men in the general population renders this view untenable. The same sort of criticism has been applied to the statistics showing the ratio of prisoners to population in different sections, without regard to the proportional strength of age groups in those sections. Thus in the western section the ratio of prisoners to the total population is highest, but no account is taken of the fact that the proportion of adult males is also higher in that section. These are a few of the objections urged against the criminal statistics of the federal census of 1890. The main point, however, in a comparison between the criminal statistics of the United States and those of foreign countries is the fact that in the United States the statistics of the census apply to prisoners alone, whereas in many foreign countries they are based upon judicial proceedings, and prison statistics are a secondary source of information. It is urged that the movement of crime in a community cannot be determined from the movement of the prison population. A decrease in the prison population does not necessarily denote a decrease of crime, "since the daily average prison population depends upon the duration of sentences and not upon the amount of crime." In spite of these defects the criminal statistics of 1890 are the latest in the United States which cover the entire country. The number of prisoners in 1890 was 82,329, and the following table classifies them according to the crimes committed:

		Percentage.
Offences against the government.....	1,839	2.2
Offences against society.....	18,865	22.9
Offences against the person.....	17,281	21.0
Offences against property.....	37,707	45.8
Miscellaneous.....	6,637	8.1
Total.....	82,329	100 0

The number of convicts in the penitentiaries in 1890 was 45,233, or 722 convicts per million; in 1880, 35,538, or 709 per million. The absolute increase was thus 9695, and the relative increase per million was only 13. Geographically the inmates of penitentiaries in the United States were divided as follows: North Atlantic Division, 14,477; South Atlantic and Central Divisions, 15,707; North Central and West-

ern Division, 15,049. As to sex, 43,442 were men and 1791 women. As to parentage, 14,725 were foreign born, 14,687 were colored, and 13,715 were native whites. The larger proportional number of criminals among the foreign born is almost wholly accounted for by the smaller proportion of children among them. The percentage of the native white prisoners to the total adult native white population was .19, while the percentage of the foreign white prisoners to the total adult foreign whites was .21. On the basis of the entire number of prisoners—that is, 82,329—the census attributes 57 per cent. of the crimes to the foreign element and 43 to the native white element. But this fact, like the ratio of the foreign-born convicts, is explained by the difference in age groups. While the foreign-born male prisoners were 26.2 per cent. of all inmates of prisons, the foreign-born males of an age at which crimes would be likely to be committed—namely, over eighteen years—were 26.38 per cent. of the total number of males of that age and over.

Recent Statistics.—No criminal statistics covering a sufficiently wide area to make them of practical value were available for 1899 in the United States, but a study of the prison statistics in several of the States seems to establish a marked decrease in the prison population beginning with the summer of 1898. In Massachusetts this decrease is in part attributable to changes in legislation, reducing the time for which prisoners held for non-payment of fines might be detained. Among the more general causes, the Spanish-American war has been cited, as drawing off an element in the population which was especially subject to temptation to commit crime. The improvement of business resulting in the more general employment of the working classes is mentioned as another factor, since the relation between crime and unemployment has been established. It must be noted, however, that this reputed decrease in crime is based upon the decrease in the prison population, which is not always a safe index. To be of much practical service the statistics should take note of the class of offenders which show a decrease. A large part of the decrease following the summer of 1898 was due to a falling off in the number of minor offenders. The law against petty offences varies in its execution from year to year, and this fluctuating stringency causes variations in the statistics which have no significance as to the general question of the increase or decrease of crime. An investigation was made in 1899 to ascertain the cost of crime to the State. The figures are given for Massachusetts, but are fairly typical for the whole country. It was estimated that the aggregate expenditure of that State amounted to \$745,000, or about one-half of the total State tax; that of the counties to about \$1,000,000, and that of the municipal governments at nearly \$3,000,000. The entire cost of police protection against criminals in Massachusetts was roughly placed at \$5,000,000, making the average cost of an arrest \$50 per prisoner, the average annual cost of keeping prisoners \$130 per prisoner, and the cost of providing buildings for prison inmates at from \$1200 to \$2500 per inmate. The apparent decrease of crime which was said to have begun in the summer of 1898 applies only to a short period of time. According to the report of the Massachusetts Prison Association there was a great increase in crime since 1883. In that year the number of arrests was 63,803, of commitments 24,125, and the average prison population for the year was 3893, while in 1898 the arrests numbered 99,336, the commitments 29,796, and the average prison population for the year 7654. An effort was made in 1899 to secure the passage of a bill which would place the county prisoners under State control with the view to classifying prisoners as to sentences, offences, criminal character, and ages, and introducing measures of reform for the improvement of prisoners, the introduction of uniformity in management and in terms of sentence, the better regulation of labor in the prisons, the more complete separation of sexes, etc. A commission recommended a bill which comprised these features, but the need of it was not perceived by the legislators and it was rejected.

For England and Wales the prison statistics since 1885 show a decrease in the number of persons committed on indictment, and an increase in the number committed on summary conviction. Of the former the average annual number during the five-year period ending March 31, 1885, was 9962, and the actual number for the year ending March 31, 1899, was 8315. This is a decrease of 16.5 per cent., and in proportion to the population of over 30 per cent. Of persons committed on summary conviction the average annual number for the five-year period ending March 31, 1885, was 149,046, and the actual number for the year ending March 31, 1899, was 151,744, an increase of 1.8 per cent., but, taken in connection with the increase in the population, these numbers represent a decrease of 14.6 per cent. It must further be noted that during this interval there has been a great increase in the number of quasi criminal offences, and that many of the convictions counted in with the figures for 1899 were for offences that did not exist in 1885.

Criminality and Marriage.—In the *Zeitschrift für Socialwissenschaft*, 1899, Prinzling has published the results of an investigation of the married state in its influence upon crime. From his statistics he concludes that married men respect property

rights more generally than single men; that they do not often commit the graver crimes against property, such as robbery or fraud; that they do not often commit offences against morality (except, of course, bigamy), or against human life. Men who marry between the ages of 18 and 25 offend against property more often than the unmarried of the same age, probably because of pressure of family expenses. Widowers commit more crimes between the ages of 30 and 50 than either the unmarried or the married; but their criminality decreases with their advancing years. He finds that widowers are especially prone to commit murder, incest, false accusation and false witness, and offences against property. His statistics show that the longer a man is married the nearer he approaches to being a law-abiding citizen. This, it has been suggested, may be due to the fact that the burdens of married life weigh heavier in the early years than later. See ALCOHOL; MARRIAGE, MEDICAL CONTROL OF.

CROATIA and SLAVONIA form a province of the kingdom of Hungary, and have a combined area of 16,773 square miles, and a combined population, in 1890, of 2,200,977, of whom 88 per cent. were Slavonians and Croats, and the remainder chiefly Hungarians and Germans. The capital is Agram, which is the seat of a university with an attendance of 568 students in 1896. On lands belonging to the university an academy of forestry with a botanical garden was opened in October, 1898. The chief products of Croatia and Slavonia are wheat, rye, barley, and oats, of which wheat is the most extensively raised, the crop in 1898 being many times as large as any of the others, and nearly twice as large as the wheat crop of the preceding year. The production of wine, fruits, nuts, tobacco, and raw silk is also important. The minerals include salt, iron and coal. The leading occupations are those connected with the soil, and agriculture engages more than 85 per cent. of the total population. But the manufacturing industries are considerable, and have increased in recent years. Matters which are the common concern of Croatia, Slavonia, and Hungary are under the legislative control of the Hungarian Diet, to which forty Croatian and Slavonian delegates are sent. They use their own language in that body, although the official language is the Hungarian. In the Hungarian executive departments there is a special minister for Croatia and Slavonia. The provincial Diet consists of 90 members chosen by the people and of certain dignitaries (not to exceed one-third of the Diet) holding their seats by inheritance or royal nomination. There is a low property qualification or the payment of a small tax required of all electors who do not practice certain professions.

CROKER, RICHARD, politician, born at Black Rock, Ireland, November 24, 1843, was brought to the United States at the age of two, and was educated in the public schools of New York. He was an alderman in New York in 1868-70, and again in 1888; coroner in 1873-76; fire commissioner in 1883; and city chamberlain in 1889-90. Mr. Croker became prominent in opposing the "Tweed ring," and has long been regarded as the leader of Tammany Hall. He attracted attention in 1899 by his "Jefferson dinner" at the Democratic Club in New York. In this year also, while a witness before the Mazet Committee, appointed to investigate alleged scandals in the municipal administration of New York, Mr. Croker caused consternation by frankly admitting that he was "boss" of the Tammany Democracy, and this organization acted upon the principle of the spoils system.

CROQUET-ROQUE. The eighteenth annual tournament of the National Croquet Association was held at the grounds of the Norwich (Conn.) Croquet Club, August 15-19, 1899. The championship was won by C. G. Williams, of Washington, with 12 out of 14 games. W. H. Wahly, of Washington, last year's champion, was second with 11 won games. The second division was won by P. N. Peck, Washington, 13 out of 14 games. Croquet has been superseded in popular favor by more vigorous pastimes, but it is still played as a game of skill. Owing to the scientific development of the game by the national association, as distinguished from the old-time croquet, the name has been changed, and the organization will be known hereafter as the National Roque Association.

CROSBY, PEIRCE, rear admiral, U. S. N., retired, died in Washington, D. C., June 15, 1899. He was born near Chester, Penn., January 16, 1824; was educated at a private school, and was appointed midshipman from Pennsylvania in 1838. He served with distinction in the Mexican and Civil wars, taking part in numerous engagements. He was promoted through all the grades to that of rear admiral. In 1882 he was in command of the Atlantic station, and of the Asiatic station in 1883, in which year he was retired.

CROUP. See VITAL STATISTICS.

CROZIER, WILLIAM, captain, U. S. A., was appointed by President McKinley a member of the American delegation to the peace conference which met at The

Hague in May, 1899. The appointment of the delegation was announced by Secretary of State Hay on April 6, 1899. Captain Crozier is the son of the late Judge Robert Crozier, of Kansas, and was born in Ohio in 1855. He was graduated from the Military Academy at West Point in June, 1876, and was assigned to the Fourth Artillery. For three years he served in the West under General Crook, taking part in the campaigns against the Sioux and Bannocks. From 1879 to 1884 he was instructor in mathematics at West Point, and in the latter year, after competitive examination, was transferred to the ordnance department, with which he has since been connected. He entered the department as a first lieutenant, and in June, 1890, received his commission as captain. After Congress in 1888 had made an appropriation for the establishment of a gun factory at Watervliet, Crozier was entrusted with the important task of investigating the improved machinery of European coast defence, and was empowered to make such purchases as he might deem wise. During the Spanish-American war he was major and inspector-general of volunteers, serving in this capacity from May 17 to November 30, 1898, when at his own request he received his discharge in order to resume his professional duties in the ordnance department. Captain Crozier is regarded as one of the most expert authorities on ordnance in the United States army, and several of his works on the subject are used in the department.

Together with General Buffington, the present chief of ordnance, he invented the Buffington-Crozier disappearing gun-carriage, now in general use in American coast-defence works. The patent rights of this invention were made over to the government by the inventors. Captain Crozier has also invented the wire-wrapped ten-inch rifle.

CUBA, the largest island of the West Indies, has an area of 45,872 square miles, a little more than that of the State of Pennsylvania, and a population estimated in 1887 at 1,631,687, of whom 528,998 were negroes and mulattoes. An estimate places the population on January 1, 1895, at 2,018,000, and on January 1, 1899, at 1,318,000, but these figures are merely conjectural. Doubt has been thrown upon the accuracy of the figures for 1887, which were the result of the Spanish census, and in August, 1899, President McKinley ordered a new census to be taken. It was not to deal with population alone, but to include statistics of the agricultural and industrial condition of the island. Such a census was politically necessary, since if representative government were soon established there, it would be necessary to ascertain the population in order to obtain the numerical basis of representation. At the close of the year 1899 the preliminary estimate of the population was 1,572,840. The capital of Cuba is Havana, with a population of about 220,000. The long coast line of Cuba is indented with a number of safe harbors. The length of the northern coast line is 918 miles, and it has 32 harbors; the length of the southern is 972 miles, with 12 important harbors.

Political Divisions.—The six provinces of Cuba were divided into three regions by the Spaniards, and these divisions have been retained under the provisional rule of the United States. The Western, including the provinces of Havana and Pinar del Rio; the Central, comprising Matanzas and Santa Clara, and the Eastern, comprising Santiago and Puerto Principe. The island, since the occupation by the United States, has been under a military governor, and each of these administrative divisions has been under a separate military governor, having exclusive charge of the local administration. Exact statistics for the production and commerce of Cuba during the year 1899 were not available, but the reports of the military governors throw light upon the general conditions of the country.

Social and Economic Conditions.—Both from official sources and from the reports of private observers the condition of Cuba appears to have vastly improved since the war with Spain. At the time when Spanish authority was withdrawn a very large part of the population were on the verge of starvation, and the political condition was one of anarchy. Reconcentrados, beggars, and criminals were the most conspicuous element in the island. As to the work which depended upon public support, it had been almost wholly abandoned. Roads were out of repair, the mail service was inoperative, public instruction had come to a standstill, and the local government possessed no authority. The mustering out of the Cuban army in May, 1899, removed a source of popular distrust, and there were signs of prompt recuperation. The industries were resumed, public order was restored, and American ideas on the subject of sanitation and hygiene produced important results. The only serious outbreak of yellow fever was at Santiago. At Havana there were very few cases as compared with past years. The tobacco and sugar-cane districts were rapidly recovering their prosperity. In some parts of the island, however, the agricultural progress was very slow, owing to the lack of the necessary capital. The financial condition of many of the municipalities, especially of those in the western provinces, was practically one of bankruptcy, and the city governments could not

1899.....	17,247,953	1,031,713	24,377,115	25,408,698

Financial Conditions.—The financial conditions greatly improved under the American occupation, and from January 1 to June 30, 1899, the receipts of the Cuban government exceeded the expenditures by nearly \$1,500,000, while the budget under the Spanish administration usually showed a deficit. Under the Spanish rule, however, it must be remembered that Cuba had to pay heavy charges on the interest of the debt as well as for the support of the Spanish army. Among the measures for lessening the burden upon the people was a decree of March 25, which abolished the *octrois*, the taxes on food, and other taxes, and which reduced the land tax. It was further provided that the sale of land for debts contracted before January 1, 1899, should be suspended until the spring of 1901. A new customs tariff, with lower rates than those of the provisional tariff established in the summer of 1898, went into force on January 1, 1899.

Sugar and Tobacco.—Cuba's sugar crop amounts in normal years to nearly one-half the entire cane-sugar product of the world, and about 2,000,000 acres of the island are devoted to the raising of sugar. The highest mark in the sugar production of Cuba was reached in 1894, when the output was 1,054,214 tons. The effect of the war upon this industry can be seen from the following figures, showing the production from 1894 to 1898 inclusive, the figure for the last-named year being merely an estimate: 1894, 1,054,214 tons; 1895, 1,004,264 tons; 1896, 225,221 tons; 1897, 212,051 tons; 1898, 300,000 tons. The United States takes by far the greatest part of the Cuban sugar crop. Tobacco raising stands next to sugar in its importance as an industry. The best quality of tobacco has for years been produced in Cuba. A comparatively small acreage is devoted to the crop, the most of which comes from the western portion of the island—namely, the provinces of Pinar del Rio, Havana, and Santa Clara. In favorable years the production of tobacco has reached a total of 560,000 bales (62,173,800 pounds), and nearly one-half (260,000 bales) comes from the province of Pinar del Rio, and is known as *Vuelta Abajo*; 130,000 bales from Santa Clara, and is called *Remedios*; 100,000 bales from the eastern provinces, and is called *Mayar y Gibara*, and 70,000 bales from Havana, and is called *Partido*. As in the case of sugar, the great purchaser of tobacco is the United States.

Mining.—The mines of Cuba are almost exclusively in the eastern part of the island, and they are chiefly concentrated in the province of Santiago, where they are principally under the control of American companies. Cuba began to ship iron ore to the United States in 1884, when the imports to the United States from Cuba amounted to 21,798 tons. In 1897 the Cuban iron ore imported into the United States amounted to 397,173 tons, which was three-fourths of the total imports of iron ore. The ore is brown hematite, and contains about 62 per cent. of iron. It is said to be especially well adapted for the making of Bessemer steel. The first claim was located in 1881, and since that date it is said that about one hundred claims have been located in the Sierra Maestre range near the city of Santiago. The mines are not worked underground, but are virtually quarries, the ore outcropping on the hillsides.

Primary Education.—In 1894 the population of the four provinces of Havana, Matanzas, Puerto Principe, and Santa Clara, was 1,175,000; the number of schools, 1255, and the attendance, 47,752; there were in 1893, in the province of Havana, 107 public and 140 private—total, 247 schools for boys; 91 public, 190 private—total, 281 schools for girls; and 11 public, 16 private—total, 27 schools for both sexes; in all, 209 public, 346 private—total, 555 schools of primary grade. The attendance was 9455 in the public schools and 12,957 in the private schools—total, 22,412. In the province of Matanzas there were, in 1894, a population of 265,025, with 75 public boys' schools, 25 private boys' schools—total, 100; 53 public girls' schools, 34 private girls' schools—total, 87; and 58 schools for both sexes, making 128 public, 87 private—total, 273 schools. In the province of Puerto Principe the population in 1894 was 69,061; public elementary schools for boys, 20; girls, 17; both sexes, 4—

total, 41; private elementary schools, 35. The attendance at the public schools in 1894 was: boys, 986; girls, 801—total, 1787; at the private schools, boys, 281; girls, 507—total, 788. The total attendance at both public and private schools was 2575.

In the province of Santa Clara there were in 1894 a population of 383,790 and 355 schools with an attendance of 12,697. In the province of Pinar del Rio the population in 1889-90 (latest available) was 229,761; schools, 160, and attendance, 4297. In the province of Santiago de Cuba there were a population of 271,010 and 186 schools with 7868 pupils.

Education in Cuba has always been of exclusive and aristocratic tendencies, the elementary instruction being given grudgingly, but the higher education comparing well with the best European or American education. In Havana, which is the seat of the university, there are several learned societies. The publications of 33 of these are received by the National Library at Washington, and there is a remarkable number of medical journals. "For a population of 200,000 souls, including many blacks, the number of scientific, educational, and literary periodicals in Havana is remarkable, and they contain valuable original articles. To sum up, therefore, the educational condition in Cuba, the evidence shows that the higher education is of a superior character; the study of the humanities has borne its usual fruit in literary taste and culture, and Cuba has given birth to poets who have attracted attention and won the praise of European critics. In recent years the sciences, with such technical applications as are adapted to the needs of a community which is not a manufacturing one, have been cultivated, and the enlightened part of the public has been kept informed of European philosophy and progress—all this with scant aid from, and sometimes despite the opposition of, the government. Elementary public instruction, on the other hand, has been and is in a very backward state, partly on account of the social condition of the island, but principally on account of the apathy and often the actual hostility of the government toward any serious attempts at improvement."

HISTORY.

The Spanish Evacuation.—On January 1, 1899, the control of Cuba was formally transferred to the United States. At that time the number of the Spanish troops in the island was estimated at 40,000, and this force was placed on the footing of exterritoriality—that is, it was regarded as a foreign army in a friendly country. On February 6, the last remnant of the Spanish forces and the last of the Spanish captains-general of Cuba embarked for Spain.

Disbandment of the Cuban Army.—For more than eight months of the year 1899 questions connected with the disbandment of the insurgent forces occupied a large part of the public attention. Toward the close of the year 1898 the United States government had agreed as a condition of disbandment that \$3,000,000 should be distributed among the officers and troops of the Cuban army. The negotiations over this matter were interrupted by the death of General Garcia on December 11, 1898, and when they were reopened the Cuban assembly declared that this sum was far too small. Through their representative, General Maximo Gomez, they presented a demand for about \$57,000,000, which was to be regarded as a loan and was to be made good out of the customs receipts of Cuba. To the government at Washington such an amount seemed excessive. On the basis of 40,000 as the strength of the Cuban army this would have meant the payment of \$648 to each private and would have reckoned the salaries of the major-generals at \$7500 apiece, and that of the commander-in-chief at \$11,000. Negotiations were opened with General Gomez through the agency of Mr. Robert P. Porter for the purpose of securing the agreement of the Cubans to the amount originally offered. It was shown that the payment of so large a sum as that demanded by the Cuban assembly would mean a long-continued occupation of the island by the United States authorities in order to repay the loan out of the customs receipts. General Gomez finally accepted the terms proposed by the United States—namely, that \$3,000,000 should be distributed among the insurgent officers and troops, that the disbanding army should surrender its arms, and

that the Cuban officers should co-operate with the United States authorities in the distribution of the money. It was expressly stated that the sum paid to each member of the insurgent army was not to be regarded as an instalment of their military pay, but merely as facilitating disbandment and providing the discharged soldiers with means of subsistence until they found employment. The assembly, however, repudiated this agreement, and, declaring Gomez a traitor, deposed him from his command. On April 4, 1899, the assembly, having failed to make better terms with the United States, voted the disbandment of the army and its own dissolution, at the same time deciding to give to General Brooke the army muster-rolls as a guide for the distribution of the \$3,000,000 among the Cuban troops. General Gomez, whom popular sympathy favored in his quarrel with the assembly, was re-elected commander-in-chief by the Cuban generals, and made their representative in co-operating with the United States officials in the distribution. There were several serious difficulties in carrying out the disbandment. In the first place the Cuban troops were unwilling to surrender their arms to the American military authorities. This difficulty was overcome by changing the order so that they were permitted to surrender to the mayors of the municipalities in the presence of American officers. It was also provided that these arms should be distributed among the arsenals, where they should be kept on exhibition as souvenirs of the war of independence. A more serious difficulty was the confusion in the muster-rolls. It was found that the rolls contained the names of 6000 commissioned officers and 42,000 non-commissioned officers and privates. The rolls were grossly inaccurate, and the only way out of the difficulty seemed to be by requiring the identification of the persons named on the list by the officers under whom they had served. Such a course would have caused too serious delay, and it was finally decided to leave the distribution in the hands of two commissioners for each corps, consisting of one Cuban and one American, who were to distribute the money at certain designated places in the provinces. Disbandment began on May 27. The work was retarded not only by the confusion of the rolls, but by the agitation of the party that was opposed to the terms agreed upon. A very small number of men enrolled made their appearance when the distribution began, but later the distribution went on more rapidly. In some places the men were dissatisfied with the amount which they received, and at Cuevitas, near Santiago, a riot broke out on account of the slowness with which payments were made, but in September it was reported by General Brooke that the distribution had been completed. Two million six hundred thousand dollars had been spent, and some 30,000 Cubans had received their respective shares. The balance of \$400,000 was returned to the United States treasury.

Military Government.—General Brooke was appointed governor-general of Cuba and was assisted in the administration by other United States army officers as governors of the departments. A civil governor was appointed to act in concert with the military. General Brooke selected the following officers for the cabinet, whose general duties were to be the same as had been exercised by the autonomist cabinet under Spanish rule: Señor Capote (state and interior), Lanuza (agriculture), Desvernine (justice and education), and Yanez (public works). The municipal government was entrusted to native officials with wider powers than they had formerly possessed. A municipal police was organized and rural constabularies were established in the provinces. The Cuban army was drawn on very largely for the police and constabulary forces, but some of the natives complained that the men chosen for these positions were not representative. The exercise of a high degree of tact was required of the United States authorities to avoid giving unnecessary offence to the natives. Through bad management the funeral of General García was the occasion of much ill-feeling among the Cubans, owing to the fact that the United States military crowded out the Cuban patriots from the functions which they were to have performed in the ceremony, and the funeral took on the character more of a military parade than of an occasion in which the Cubans and the United States troops united to do honor to the Cuban general. The sharp criticism which this occasioned soon subsided, and the reception of General Gomez at Havana created a favorable impression at the same time that it gratified the Cubans' natural fondness for display. The American troops turned out in honor of Gomez, who was met at Havana by the official representative of the governor-general. On the whole, considering the confused state of affairs following the war, a fair degree of order was maintained. Brigandage was suppressed either by the rural police or by United States troops. The misconduct with which United States troops were charged toward the close of the year 1898 and the difficulties between them and the natives, as illustrated by the conflict between the negro volunteers near Santiago and the native police, came to an end with the withdrawal of the volunteers and the substitution of the United States regulars. A number of important changes were effected under the military régime of the Americans. A pardon was issued for offences committed against Spanish military law. Some restriction of the native press

BRIGADIER-GENERAL LEONARD WOOD, MILITARY GOVERNOR OF CUBA.

was found necessary, and a decree was issued laying the responsibility for the publication of libels and other seditious writings in the papers on the editors and proprietors. Another important change was the abolition of the Spanish *incommunicado* system, by which the accused person was left in ignorance of the charges against him. It was provided that henceforth the accused person should know the charges against him and the name of his accuser, and that he should also have the right to engage counsel in twenty-four hours following arrest, and should not be forced to bear witness against himself. Press censorship was established at Santiago in June, and General Ludlow, the military governor of the city of Havana, suppressed a newspaper at Havana in August. Another decree permitted foreigners to practise professions which required special training, provided they could show diplomas from competent authorities in their own country. The work on the reconstruction of the judiciary was completed in August with the appointment of judges for the Supreme Court and judicial officers in the provinces. On the whole the benefits which were claimed as the result of American occupation were the restoration of order, the relief of poverty, the suppression of many administrative abuses, and the adoption of excellent sanitary measures, of which the most important practical results were the checking of yellow fever and the reduction of the death rate. Besides this the taxes were reduced and a number of important public works were undertaken.

Spaniards in Cuba.—Those Spaniards remaining in Cuba who desired to retain Spanish citizenship were required to register their names. There were evidences of sharp antagonism between the Cubans and Spaniards, and on some occasions this took the form of violence. A former lieutenant of a Spanish guerrilla force was lynched by a mob of Cubans on June 5, 1899, at San Antonio, and there were other instances of rough treatment of the Spaniards at the hands of the mob.

Relief Measures.—Some account of the distribution of rations for the purpose of averting acute cases of distress has been given in a preceding paragraph. Besides distributing these rations, efforts were made to employ the needy in public works. The sufferers from the war, especially the reconcentrado class, were, in many cases, prevented from the resumption of work by their lack of farm implements, but no regularly organized system was followed to meet this difficulty.

Policy of the United States toward Cuba.—An apparent object of the policy of the United States toward Cuba has been to prepare the Cubans for the exercise of self-government—a difficult task in view of the fact that the population has for centuries been in a condition of political slavery. The administration has advanced cautiously, and, while it has been its intention to withdraw the American troops as soon as possible, its plan is to maintain garrisons in certain parts of the island until it is evident that the people can be safely entrusted with the management of their own affairs. The general policy of the United States was indicated in the proclamation of President McKinley, dated August 17, in which he said that the census recently ordered in Cuba was the first step toward the accomplishment of the duty incumbent upon the United States to restore order and peaceful industry, and to give its attention to the means by which the Cubans might form an effective self-government. It was said that as soon as the census should be finished, local elections would be held in the island with a view to establishing a civil government. Apart from the original subjects of the statistical inquiry, the census was to investigate the sentiments of the people in regard to the establishment of a Cuban republic. In general, the policy of the United States was viewed with favor in Cuba, except by those radicals who still were insisting upon the absolute independence of the island. There is a strong party that would even prefer annexation to the United States, or the establishment of an American protectorate, to the total withdrawal of American authority.

CUBAN FEVER. See TROPICAL FEVER.

CULBERSON, CHARLES A., ex-governor of Texas, was elected as a Democrat, by acclamation, by the Texas legislature to the United States Senate, to succeed Senator Roger Q. Mills, January 24, 1899. Senator Culbertson was born in Alabama in 1855; he was graduated at the Virginia Military Institute in 1874, after which he studied law and was admitted to the bar. He was governor of Texas from 1894 to 1898. His term in the Senate will expire March 3, 1905.

CUMBERLAND PRESBYTERIAN CHURCH reports much activity for 1899 in the organization of committees for, and the inception of work upon, the collection of \$1,000,000 which it is proposed to raise for educational purposes and the enrolling of 50,000 new Sunday-school pupils, which it is hoped will be accomplished by July 1, 1901. The new synod, called the Indianola Synod, formed of the Cherokee, Chickasaw, Choctaw, and Greer presbyteries, embraces Oklahoma and Indian Territories, numbers some 45 ministers, 25 probationers, 76 churches, 1714 communicants, and 820 Sunday-school scholars, and has property valued at \$19,000, and an

annual income of about \$6000. Four new missionaries were sent to China and Japan. This branch of the Presbyterian Church in 1899 had 16 synods, 123 presbyteries, 1720 ministers, 2982 churches, and 186,582 church-members.

CUMBERLAND PRESBYTERIAN CHURCH (COLORED) reports 5 synods for 1899, with 23 presbyteries, 150 ministers, 400 churches, and 39,000 communicants.

CURAÇAO, a Dutch colony lying north of the Venezuelan coast, and comprising the islands of Curaçao, Aruba, Bonaire, Saba, St. Eustache, and part of St. Martin, has a total area of 403 square miles, a population (at the beginning of 1897) of 49,599, of which the island of Curaçao has 210 square miles and 28,884 inhabitants. The government is directed by a governor, assisted by a council, all being nominated by the sovereign of the Netherlands. At the beginning of 1897 there were 41,235 Roman Catholics, 7730 Protestants, and 831 Jews; 28 schools, with upward of 5538 pupils. The revenue, which is derived from customs and excise duties, land taxes, and some indirect taxes, was estimated for 1898 at 638,000 guilders, and the expenditure 700,000 guilders. (The guilder is worth \$0.402 United States currency.) Deficits are paid by Holland. The imports of the island of Curaçao amounted in 1896 to 2,962,668 guilders; in 1897, 2,679,924 guilders. The chief products are maize, beans, pulse, cattle, salt, lime. The shipping entered at the ports of the colony in 1896 aggregated 526,148 tons.

CURLING. One of the most fascinating of winter sports is the venerable game of ice-curling, like golf of Scotch origin, and largely supported in America by natives of Scotland. The annual curling competitions, though not widely advertised, are contested with much spirit and are full of interest to the spectator. The annual champion club match for the Mitchell medal was held January 20, 1899, at Hoboken, N. J. The play was on six rinks, and was won by the Van Cortlandt Club, I. Frazier being *skip*. The games of the North v. the South of Scotland for the Dalrymple medal, held at New York for many years, were abandoned during 1897-98, but were revived in 1899, and were won on December 28 by the South, the score being 87 to 59 and the play on five rinks. The Ontario tankard is a trophy competed for annually by clubs belonging to the Ontario Curling Association, divided into sixteen groups; deciding contests take place at Toronto, 128 curlers participating. The trophy was won in 1899 by the Fergus team. The Gordon medal, in the international match played at Montreal, two rinks, on February 24, was won by Canada. The Canadians defeated the Americans also in the match for the Walker trophy, at St. Paul, Minn. The annual Hoboken, N. J., match of the Scots against all nations was won by the former on January 19, by 30 to 26.

CURRENCY REFORM. In 1899 the prospects of currency reform seemed to be more promising. In the President's second annual message to Congress at the close of 1898, he said: "In my judgment the present condition of the Treasury amply justifies the immediate enactment of the legislation recommended one year ago, under which a portion of the gold holdings should be placed in a trust fund, from which greenbacks should be redeemed upon presentation, but when once redeemed should not thereafter be paid for gold." This plan, which would relieve the government of the much-lamented "endless chain," seemed to meet with general approval among the friends of sound money. The separation of the gold reserve from the general fund of the Treasury was regarded as a matter of the greatest importance by all those who had not forgotten the lesson of 1893, when the impairment of the gold reserve caused so much anxiety. The creation of this trust fund would oblige the secretary of the treasury to look to other means than the gold reserve for making good the deficiency of revenues. Congress would have to meet the emergency by revenue legislation. There would be no more borrowing for the purpose of securing gold to protect the government's currency—a practice which experience shows to be injurious to the public credit. The Fifty-fifth Congress closed without passing any currency measure. The McCleary bill, described in the preceding YEAR BOOK, was withdrawn by the House Committee on Banking and Currency. Two other measures were afterward drafted, the one proposed by E. J. Hill, a Republican representative from Connecticut, and the other by M. Brosius, a Republican representative from Pennsylvania. The Hill bill was prepared by the House Committee on Coinage, Weights, and Measures. Its leading features were, first, an emphatic declaration of the gold standard; second, provision for the gradual retirement of greenbacks; third, permission for the banks to issue circulation to the par value of the bonds deposited; fourth, the substitution of a tax of one-tenth of one per cent. upon the value of the bank's franchise for the present tax circulation; fifth, permission for national banks to organize with a capital of only \$25,000 in small towns. The Brosius bill was not so detailed as this measure, but contained the three provisions relating to the tax, the issue of notes to the par value of the bonds, and the organization of banks with a capital of \$25,000. Neither of these bills was

passed, and on February 2 the Republican caucus of the House of Representatives formally abandoned any attempt to pass currency acts during the Fifty-fifth Congress, giving over the subject to a committee of eleven which was to report at the first session of the Fifty-sixth Congress. This committee, consisting of Representatives Henderson, Payne, Dalzell, Overstreet, Curtis, Lovering, Loud, Hawley, Babcock, Morris, and Kerr, held its session at Atlantic City, N. J., from April 17 to May 1, 1899, and finally agreed upon a bill, the text of which was published on November 28. It is entitled "A bill to define and fix the standard of value, to maintain the parity of all forms of money issued or coined by the United States, and for other purposes." It begins with an express affirmation that the standard unit of value shall be the gold dollar of 25.8 grains of gold and .9 fine. It then states that all interest-bearing obligations now existing or hereafter to be entered into, and all United States notes and treasury notes issued under the law of July 14, 1890, shall be payable in gold coin. But nothing in this provision is to be construed as affecting the present legal tender quality of the silver dollar, or of the subsidiary or minor coins, or of the paper currency of the United States, or of national bank-notes as receivable for certain public debts and dues and obligations between national banks. The bill next provides for a separate division of issue and redemption under the treasurer of the United States, to which is to be assigned the records and accounts relating to the issue and redemption and exchange of United States money, and to which shall be transferred "as a redemption fund the amount of gold coin and bullion held against outstanding gold certificates, the amount of United States notes held against outstanding currency certificates, the amount of silver dollars held against outstanding silver certificates, the amount of silver dollars and silver bullion held against outstanding treasury notes issued under the act of July 14, 1890, and the amount of gold coin and bullion which constitute a reserve fund equal to 25 per cent. of the amount both of United States notes and treasury notes issued under the act of July 14, 1890." The safeguarding of the silver dollar is provided for by the requirement that the secretary of the treasury shall maintain the gold reserve fund by transferring to it moneys not otherwise appropriated, and by issuing and selling United States bonds, whenever in his judgment it is necessary, at a rate not exceeding 3 per cent. In other words, the secretary of the treasury is to keep the two metals at a parity, and is supplied with the necessary means for that end. Many held that all the obligations of the government were payable in gold without this new clause, but it is important as a definite and positive statement of the fact. The bill provides for the coinage of any silver bullion in the Treasury purchased under the act of July 14, 1890, into subsidiary silver coin when it is necessary to meet the public requirements for such coin. As to the national bank circulation, the amendments in the existing law were important, but by no means so radical as many of the currency reformers desired. In the first place, the banks were permitted to issue notes to the par value of the bonds deposited; secondly, a tax of one-tenth of one per cent. upon the value of the bank's franchise was substituted for the existing tax on circulation, and thirdly, banks with a capital of \$25,000 may, with the sanction of the secretary of the treasury, be organized in any place whose population does not exceed 2000. The House passed this measure on December 18. In the Senate a bill very similar to this was drafted by the Finance Committee and reported on December 19. This bill contained a plan for refunding the debt. The secretary of the treasury was authorized to issue gold bonds bearing 2 per cent. interest for outstanding bonds maturing before 1908, and bearing 5, 4, or 3 per cent. interest. The two bills were under discussion when Congress adjourned.

The Comptroller's Proposals.—In his annual report for the year ending October 31, 1899, the comptroller of the currency renewed his recommendation of the previous year that provision should be made for unsecured emergency circulation in order to check the injurious effects of financial panics, this circulation to be taxed so heavily that in ordinary times it would not be issued. The notes would be available only in times of emergency, and the tax, besides causing them to be quickly retired when the panic had passed, would also provide a fund out of which the notes of insolvent banks might be redeemed. Such a provision would in his opinion secure elasticity for the currency, even if the principle of a bond-based currency were retained. The President's idea, embodied in the bill framed by the Republican Caucus Committee, that notes should be issued to the par value of the bonds deposited, was also favored by the comptroller, who, in addition, recommended a taxation of two or three per cent. on the additional 10 per cent. circulation thus allowed. At the same time he favored the reduction or abolishment of the existing tax of one per cent. on the circulation. The comptroller estimates the possible bond-secured emergency circulation at \$30,000,000, and even if the uncovered emergency circulation were not adopted, the changes recommended would be of great public service. He does not think that the issue of notes based on the assets of the bank would be justifiable under normal conditions, but only in times of panic, when it would be a remedy like the use of clearing-house certificates.

CYCLING. The most notable matter of discussion in the bicycling world during 1899 was the question regarding the control of racing. A number of the prominent wheelmen on the track became dissatisfied with the management of the sport as carried on by the officials of the League of American Wheelmen, and entered races under the newly formed National Cycling Association. In spite of the efforts of the former body, it became evident that the National Cycling Association would eventually supersede the league as a racing body. Such was apparently the preference of the great majority of the league's own members, although officially the league resented, and for a time resisted, the entrance of the cycling association into the racing field. Those who favored the retirement of the L. A. W. from the control of track affairs were of the opinion that that organization should devote its time solely to the aims for which it was founded—namely, an active and constant campaign for good roads, and furtherance in all possible ways of the personal and legal interests of wheelmen. It became certain toward the close of 1899 that the L. A. W. would at its annual meeting formally relinquish control of professional and amateur racing. As a result it is believed that the organization will become stronger than ever as a national association for the advancement of general wheeling interests. The membership is now about 10,000.

Several remarkable records were made during the year. Charles M. Murphy, of New York, rode a mile, on June 30, in 57½ seconds, being paced by a locomotive on the Long Island Railroad, making by far the greatest speed ever attained by a machine propelled by man. He rode upon a straightaway, board track, and was sheltered by a wind shield on the locomotive, with great suction power. He lost the pace at one time and dropped behind, but caught up again by a wonderful spurt. Other paced professional races of the year established the following time: One-half mile, 40¼ seconds; one mile, 1.19; two miles, 2.54; three miles, 4.23; four miles, 5.51¾; five miles, 7.12¾. The one-mile record was made by "Major" Taylor, and the others by E. A. McDuffee, who is said to have used wind shields, with a flying start. The six-day race, held in New York in December, was run under new regulations, the riders being allowed to contest only in pairs and not as individuals. Each was allowed to ride not more than twelve out of every twenty-four hours, the total made by both being credited to them jointly. Miller, the winner of 1898, and his partner, Waller, covered 2733 miles, 4 laps, which is 726 miles more than the mileage made by Miller alone in 1898. A number of new amateur track records were made in 1899, the Pacific Northwest contributing to them for the first time. The year showed a remarkable decline in general riding and club membership, affecting even the League of American Wheelmen. Wheeling as a fad having now died out, a healthy growth is assured for the sport, while the bicycle itself is becoming more and more devoted to business uses, one example of which is the equipment of telegraph-boys in New York City with wheels.

CYPRUS, one of the largest of the Mediterranean islands, lying about 40 miles west of the Syrian coast, is a dependency of Great Britain, acquired from Turkey in 1878. It has an area of 3584 square miles, and a population of 221,343, of which 161,360 are Greek Christians and 47,926 Mohammedans. Cyprus belongs to the second class of representative colonies, in which the legislature is partly elective and partly controlled by the governor. The executive and administrative authority is vested in a British high commissioner, with an executive council, and in a legislative council of 18, of whom 12 are elective. Its capital is Nikosia, an inland town of 12,515 inhabitants. Larnaca, population 7593, and Limasol, population 7388, are ports. The foreign trade is good, the principal exports being grain, wine, silk, cotton, hides, wool, stock, fruits, and vegetables; imports: cotton and woollen goods, tobacco, groceries, rice, iron, leather, petroleum, timber, sugar, soap, and copper manufactures. The import and the export values are about equal. The revenue, derived chiefly from tithes, customs duties, excise, stamps, etc., has an annually increasing excess over the expenditures of the island. In 1899 the Imperial government, under the Colonial Loans Act of 1899, advanced £314,000 for harbor railways and irrigation works. The railway will run from the capital, Nikosia, to Famagosta, where a harbor will be made.

DAHOMEY. The French West African dependency of Dahomey, on the Gulf of Guinea, between the British Gold Coast and the Niger Territories, has attracted attention within the past few years by reason of the conflicting claims of France, England, and Germany over a large stretch of country in West Africa, in which was included the hinterland of Dahomey. Dahomey comprises two political divisions, with a total area given in 1898 as about 14,000 square miles, but which was somewhat increased in 1899 by the Anglo-French treaty. Its population is about 600,000. Dahomey was acquired by the French in 1892 through the defeat and dethronement

of the native sovereign. It is divided into, first, a protectorate, the native kingdom under the rule of a local African prince, and, second, a colony proper, comprising the Benin settlements on the coast, and an area of back country. The colony has been united for administrative purposes with French Guinea (*q. v.*), but has been under the direction of a local governor. In 1899 part of French Soudan, which then ceased to be a separate colony, was assigned to the colony of Dahomey, and the colony was placed under the governor-general of French West Africa, at St. Louis. The capital is Abomey, north of the port of Whydah, which with Kotonu is the principal trading town. Grand Popo and Porto Novo are also trading centres. The Dahomé, or natives, carry on the principal agricultural operations. There are exported from Dahomey maize, cattle, ivory, India-rubber, and the finest palm oil. It is reported that the exports for palm oil reached a total for 1899 of nearly 10,000 tons, and about 20,000 tons of palm kernels are said to be exported annually. In regard to the territorial dispute affecting Dahomey, see NIGER TERRITORIES.

DAIRYING. The subject of dairying is one which has received considerable attention within the last few years, as is evidenced by the many radical changes which have taken place in the methods of work. This improvement is especially notable in the United States and in such European countries as Denmark, Holland, and Sweden, where there are many dairy schools and experiment stations for investigation. In Denmark, the leading dairy country of the world, there are about a dozen high-grade agricultural institutes, where courses in dairying are given, besides about one hundred high schools where this subject receives some attention, and about two thousand dairies which receive pupils for practical work. In the United States there are fifty institutions, including agricultural colleges and minor institutions, where courses in dairying are given. The number of creameries in operation in the United States in 1896 was estimated at ten thousand, and about one-fifth, or 300,000,000 pounds of the total butter output for that year was made in creameries.

There is no branch of agriculture in which co-operation has been so extensively practised as in dairying. This has been the means of instilling more business-like methods into the dairy farmers, as well as introducing a spirit of co-operation among farmers which has enabled them to combine their influence in working for better conditions. With the introduction of modern dairy methods much of the old-fashioned drudgery which befell the farmer's wife has disappeared. In many parts of the United States the farmer now brings his fresh milk to the creamery, which is weighed, and a sample is tested for the percentage of cream which it contains. The amount of cream which the milk contains is readily ascertained from this test. He receives credit for the cream, and the skim milk corresponding to the amount due him is taken back to his farm, while in some other instances an agent of the creamery takes the separated cream directly from the farmer's house to the creamery.

Dairy Breeds.—One of the results of practical experience and scientific investigation which has been pretty well established is the proper breed of cattle for dairy purposes. The Jersey and Guernsey are the best butter producers, as they will produce the largest amount of butter fat of the best quality and flavor for the least money. For milk producers, however, the Holstein-Frisian are the best, but their milk is so poor in solid material that it not infrequently falls below the legal standard. On the other hand, the Ayrshire milk is good for consumption, as it is not so rich in fat as the Jersey and Guernsey, or so watery as the Holstein-Frisian. The Ayrshire are especially adapted for general purposes, and are an excellent stock for cross-breeding on account of their rugged constitution. Native cattle are also used for breeding, but it is difficult to transmit their characteristics on account of their mixed nature and lack of prepotency. When bred with a thoroughbred bull, however, a better strain of cattle is produced. All of the characteristics are found in the mixed breeds.

Produce and Feeding.—The amount of butter which an average cow will produce per annum is about 130 pounds, the value of which is considered quite near the cost of keeping. The better breeds of cattle will produce from 300 to 350 pounds, and individuals go higher. In so far as the modification of characteristic products of the various breeds are concerned by feeding, it is generally considered that while the quantity of milk can be increased the quality cannot be modified except temporarily. The generally accepted rations for dairy cattle consists of the following ratio: Proteids, 1; carbohydrates, 5.4, although recent experiments seem to show that a slightly wider ratio is superior.

Dairy Apparatus.—The great changes which dairying is undergoing at the present time and the numerous improvements which are taking place are due largely to the introduction of various types of machinery for handling dairy produce. The original Babcock tester, which consists of a centrifugal method of separating cream in small graduated tubes, would read to about one-tenth per cent., whereas recent modifications and improvements of this tester is capable of giving results equal to one-hundredth per cent. The Babcock tester is universally used by dairy men in testing their cattle. The improvement in mechanical separation has been equally noteworthy.

There are at the present time some half a dozen or more separators on the market, some of which are American inventions and others of European origin. Those most generally in use are the De Lavel, United States, Sharples, and National. Recent experiments have shown that these separators are capable of taking out all but .01 per cent. of the butter fat in the milk. Much improvement is being made in the construction of new churns, and combined churns and butter makers are now on the market, which greatly facilitate the making of butter. Butter made in these appliances requires less manipulation, can be held at a constant temperature, and avoids mechanical losses. A recent European invention is the combined separator, churn, and butter worker. This machine separates the cream from the milk, Pasteurizes it, cools, and churns it.

Milk and Cream Preservation.—Numerous attempts have been made during recent years to preserve milk and cream, but outside of the method of condensation little progress has been made toward absolute sterilization without detriment to the product. Undoubtedly milk and cream can be absolutely sterilized without injuring in the least its flavor, and this, it may be stated, has been accomplished, although the method and apparatus has not as yet been perfected and put on the market. Should a practical method be discovered the dairy industry would be completely revolutionized. The chemical and excessive heating methods of preserving milk are unsatisfactory on account of their rendering the milk unwholesome. Pasteurization of milk and cream, which consists of subjecting it to a temperature of 140° to 155° Fahr., is largely practised for hygienic reasons, and it enables dairymen to handle their products to a much greater distance. Pasteurized cream is now in use to a considerable extent in the United States, which contains 40 to 50 per cent. of butter fat and retails for about 40 cents per quart. This gives a better profit to the farmer than butter. Many improvements are constantly being made in Pasteurization, and the same idea holds good here as in other new dairy apparatus—namely, to make the apparatus do continuous instead of intermittent work.

Quality of Butter.—The price paid for butter varies considerably in the United States. Ordinary butter at the present time sells from 25 to 35 cents per pound, according to the quality, and fancy butter brings as high as 50 cents or \$1 per pound. Pure cultures of bacteria for ripening butter and giving it a flavor and aroma have been in use for some years, and this method is now in vogue in Denmark and other European countries. In the United States, however, this practice has somewhat fallen off, as it has been found that good butter can be made without the aid of inoculation of specific germs. Nevertheless, the use of pure cultures in the United States has brought out the fact that care and cleanliness in the dairy is of the utmost importance in butter making. Among the ferments which have been tried in this country are Hansen's Lactic Ferment, which is used to give a certainty to butter ripening, Conn's No. 41 Bacillus, and the Boston Butter Culture.

Dairy Laws.—Most of the United States of America possess dairy laws for the purpose of protecting the farmer and consumer of dairy products. These laws vary much in the several States, and some of them are very bulky for the reason that old existing laws have not been repealed and replaced by new ones. Space, however, will not permit of their discussion here. It may be stated that these laws cover the milk standard, the constituents of butter and cheese, and special laws for controlling imitations. A full account of these laws, including those of Canada also, can be found in the fourteenth annual report of the Bureau of Animal Industry, Washington, D. C.

DALY, AUGUSTIN, playwright, dramatic critic, and theatrical manager, died in Paris, France, June 7, 1899. He was born at Plymouth, N. C., July 20, 1838. In December, 1859, he began to write for the New York *Sunday Courier*, and for nine years was active in dramatic journalism, acting as dramatic critic not only for the *Courier*, but for the *Evening Express*, the *Weekly Citizen*, the *Sun*, and for a while for the *Times*. His first successful play was *Leah, the Forsaken*, adapted from Mosenthal's *Deborah*, and produced in December, 1862, in Boston, and in the following month at the Winter Garden Theatre, New York, with Kate Bateman as "Leah." His next venture was to add to the task of play adapter that of manager, and soon after he was successful in his presentation of *Taming a Butterfly*, adapted from Sardou's *Le Papillon*, and *Griffith Gaunt*, which he adapted from Charles Reade's well-known novel. His first original drama was *Under the Gaslight*, a New York story, produced in 1866. Thereafter Daly's productions included plays of his own writing or adaptation and plays of contemporary and classic authors. Of the former class may be mentioned *Seven-Twenty-Eight*; *Pique*; *Divorce*; *The Great Unknown*; *Love on Crutches*; *The Railroad of Love*; *The Red Scarf*; *The Last Word*. In the summer of 1869 Daly assumed the management of the old Fifth Avenue Theatre, in West Twenty-fourth street, on the site afterward occupied by the Madison Square Theatre. He continued as manager of the Fifth Avenue until it was destroyed by fire on New Year's Day, 1873. In December of that year he

opened the new Fifth Avenue Theatre. He returned in 1879 from a long trip abroad, in which he had devoted himself to observation and study, and in September of that year he opened Daly's Theatre. This theatre became famous for histrionic talent, scenic effect, and excellence of the plays produced. Almost from the first Miss Ada Rehan has been the leading actress there; in fact, she was in the cast of the first play presented, *Love's Young Dream*, and appeared the first night. Among Daly's many productions in this theatre are the following: *An Arabian Night*; *The Passing Regiment*; *The Country Girl*; *The Wonder*; *The School for Scandal*; *The Recruiting Officer*; *The Inconstant*; *The Belle's Stratagem*; *The Squire*; *Lords and Commons*; *The Great Ruby* (his last production); *The Merry Wives of Windsor*; *A Midsummer-Night's Dream*; *Twelfth Night*; *The Taming of the Shrew*; *As You Like It*; *The Merchant of Venice*; *Two Gentlemen of Verona*; *Much Ado About Nothing*; *Love's Labor's Lost*; *The Tempest*.

Daly's Theatre was long recognized as a dramatic school of high practical value, and positions in his casts were eagerly sought by aspiring members of the profession. Daly's observation of details was remarkable and his discipline was severe, the result of which was to bring out the best qualities of his actors. During his career he was associated as manager with hundreds of well-known actors, among whom the following may be named: G. L. Fox, Mrs. Scott Siddons, E. L. Davenport, Fanny Davenport, George Clarke, James Lewis, Mrs. Gilbert, Clara Morris, Kate Claxton, Sara Jewett, W. J. Le Moyne, George Griffiths, Fanny Januschek, Mrs. John Wood, John Brougham, Charles Coghlan, John Drew, Maurice Barrymore, Edwin Booth, Carlotta Leclercq, E. A. Sothern, Virginia Dreher, Isabel Irving, Maxine Elliott, Henry Dixey, Frank Worthing, Charles Richman, Ada Rehan. Daly's company made several English and European tours, and in 1893 Daly's Theatre, Leicester Square, London, was opened. But the simultaneous management of theatres on both sides of the Atlantic was not profitable.

DALY, CHARLES PATRICK, LL.D., ex-chief justice of the Court of Common Pleas in New York City, died at North Haven, Long Island, September 19, 1899. He was born in New York, October 31, 1816. After attending the public schools for a time he went to Savannah, Ga., where he obtained a clerkship. Becoming dissatisfied he went to sea, and during the next three years visited many prominent ports of the world. One of his voyages took him to Algiers, and he was present at the siege and capture of that city in 1830. Having returned to New York, Daly became a mechanic's apprentice and devoted his leisure hours to study. At the end of his apprenticeship he entered the law office of William Soule, and, though at that time seven years of study were required for admission to the bar, so diligent and successful had Daly been in his work that upon a motion before Chief Justice Nelson the seven-year rule was set aside and the young lawyer was admitted to practice after studying three years. This was in 1839. In 1843 he was elected as a Democrat to the legislature. In the following year Daly was appointed by Governor Bouck a justice of the Court of Common Pleas in New York City, and on this bench he remained for forty-two years. By an amendment to the State constitution the office became elective in 1846, and Daly was elected to the same position, and thereafter was re-elected three times; while from 1858 to the time of his retirement for age in 1885 he was chief justice of the court.

Daly was always known as a just and non-partisan judge. It was his uprightness that brought upon him the displeasure of the "Tweed ring," which attempted to defeat him for renomination in 1871 when his second term was about to expire. Then came, however, the exposure of the ring, and Daly was the nominee of both the Democratic and the Republican party; it is said that every vote cast in the city of New York for the judiciary that year was cast for him. During the Civil War he was a staunch supporter of President Lincoln's administration. He was a member of the State constitutional convention in 1867. Besides his legal fame, Daly gained a reputation for scientific and literary attainments; of him Baron von Humboldt wrote: "Few men have left upon me such an impression of high intelligence on subjects of universal interest." From 1864 to the time of his death he was president of the American Geographical Society, and his annual addresses to the society were valuable contributions to geographical literature. He was an honorary member of nearly all the foreign geographical societies, and a member of several scientific societies in this country. In 1860 he received from Columbia the degree of Doctor of Laws. When he died his library comprised 12,000 volumes. He wrote: *A History of Naturalization and of the Laws in Different Countries*; *The Judicial Tribunals of New York from 1623 to 1846*; *The First Settlement of the Jews in North America*; *The Origin and History of Institutions for the Promotion of Useful Arts by Industrial Exhibitions*; *What We Know of Maps and Map-Making Before Mercator*; *When Was the Drama Introduced in America?*; *History of Physical Geography*; *The Nature, Extent, and History of the Surrogate's Court in New York State*; *Comparisons Between Ancient and Modern Banking Systems*. Be-

sides these he published a number of volumes of law reports and many important legal papers.

DAMS. An immense masonry dam is now being built across the river Nile, at the Assouan cataracts, by the Egyptian government. It is all the more notable because it is located just below the small island on which is the Temple of Philæ. To lessen the danger of injuring the temple, so precious to Egyptologists and lovers of ancient art, the dam is not being carried to so great a height as utilitarian reasons would demand, but nevertheless it will be over 90 feet high. It is nearly 6400 feet, or over a mile, long, 23 feet wide at the top, and about 80 feet wide at the bottom. It is built of granite rubble masonry, and is founded on solid granite rock. The top will be about 10 feet above the level of high water in the reservoir, and will carry a roadway, thus serving as a bridge as well as a dam. The flood-waters will be discharged through sluiceways built in the body of the dam. There will be 180 of these, of which 140 will be about 6½ feet wide and 23 feet high, and 40, placed higher up, will have half as great an area as the lower ones. All of the upper and 20 of the lower sluices will be lined with cast-iron plates, about 1½ inch thick. During the flood season all the sluices will be open, discharging the whole flood-waters of the Nile, which on extraordinary occasions are estimated at 490,000 cubic feet per second. A canal a mile long, with locks giving a total fall of nearly 70 feet, in four drops, will provide for the passage of boats around the dam. The capacity of the reservoir formed by this dam will be about 280,000,000,000 gallons. The water will be collected between November and April, and will be used during May, June, and July, after having flowed down the river for 330 miles, to Assuit, where a diverting dam, or barrage, will turn the water into irrigation canals. This barrage is no mean structure, being over half a mile long, and having 120 openings, each over 16 feet wide, with piers nearly 7 feet wide between them. The structure will be of granite masonry, on a continuous foundation or floor of concrete some 10 feet thick, with a continuous row of cast-iron sheet piling on the upper and the lower side of the concrete. The estimated cost of the Assouan dam, lock, and accessories, including land, is \$6,125,000; of the Assuit barrage, \$2,245,000; which, with \$380,000 for the headworks of the Ibrahimia irrigation canal, make a total of \$8,750,000.

In this country a very high dam is being constructed to form a reservoir for the water-supply of Denver, Col. Its greatest height will be 210 feet, but the site is so ideal, being in a narrow, rocky gorge, that it is only 25 feet long at the base, not over 50 feet long for the first 50 feet in height, and only some 500 feet at the extreme top. The dam will have a water-tight inside face or lining, composed of steel plates, each 5x10 feet in area, ¾ inch thick, coated with asphalt to prevent rusting. These plates will be riveted to steel beams, extending into the rock below and at the sides of the dam. The steel plates, which are placed at an angle of 60° to the horizontal, are backed by 2 feet of concrete, and behind the concrete is 15 feet of carefully laid granite blocks. The bulk of the dam, still further back, is of granite boulders, thrown into place by the force of the blasts which dislodge them from the side of the gorge, or else deposited there from cars running on a temporary bridge. Water will be drawn from the reservoir through tunnels driven through the rock. One of these will be located 110 feet above the bottom of the dam, and the water drawn through it may be used to develop electrical power. The dam will form a reservoir having a width of from a few hundred feet to 1½ miles and a length of 7 miles. The water will be 200 feet deep at the dam, 150 feet deep three miles away, and 50 feet deep six miles up stream. The storage capacity of the reservoir will be 35,000,000,000 gallons. The dam is being built for the Denver Union Water Company by an auxiliary corporation known as the South Platte Canal and Reservoir Company. It is located on the South Platte River, about 48 miles to the south of Denver. Mr. Charles P. Allen is the chief engineer of the company.

Work on the great Croton dam for the water-supply of New York City has been continued throughout the year, and must proceed for a number of years more before it will be completed. Preliminary work is in progress for a large dam across the Nashua River at Clinton, Mass., for the water-supply of the Metropolitan Water District, which includes Boston and other municipalities in that vicinity.

DANFORD, LORENZO, member of Congress, was born in Belmont County, O., October 18, 1829; died near St. Clairsville, O., June 19, 1899. He was educated at the public schools and at Waynesburg, Penn.; was admitted to the bar in 1854, and from 1857 to 1861 was prosecuting attorney of Belmont County. He entered the Union service in April, 1861, and rose to the rank of captain, serving until August, 1864. In this year and in 1892 he was a Presidential elector. As a Republican, he represented in Congress the sixteenth district of Ohio from 1873 to 1879. He was elected again to the Fifty-fourth, Fifty-fifth, and Fifty-sixth Congresses; his term of office would have expired in 1901.

DANFORTH, ex-Judge GEORGE F., was born in Boston in 1819, and died September 25, 1899, in Rochester, where he had practised law for over fifty years. He graduated from Union College in 1840. In 1876 he was the Republican candidate for judge of the Court of Appeals, but was defeated by Robert Earl. Two years later he was renominated and elected, taking his seat January 1, 1879. He retired in 1891. He was a member of the Judiciary Commission in 1892. He continued the practice of his profession up to the time of his death.

DANISH WEST INDIES, three islands—St. Croix, St. Thomas, and St. John—lying to the east of Puerto Rico and belonging to Denmark, have been regarded by naval authorities and others since the Spanish-American war as points of such strategic value as to warrant their purchase by the United States. Toward the close of 1899 it was reported that an unofficial offer had been made by Denmark to sell the islands to the United States for \$3,000,000. In the same month (December) there were rumors that Germany was negotiating for the islands, but later in the month it was announced that that government would enter upon no course that might be regarded as an infringement of the Monroe Doctrine. It was thought in some quarters that the question of purchasing the islands would be brought before the Fifty-sixth Congress. Three times already there have been negotiations between Denmark and the United States for the transfer of the sovereignty of the islands. A treaty to this effect was made by Secretary of State William E. Seward in 1865, but was rejected by the Senate. Again in 1892 and shortly before the Spanish-American war efforts were made in the same direction.

The islands have a total population of 35,156, apportioned as follows: St. Croix, area 74 square miles, population 19,783; St. Thomas, area 23 square miles, population 14,389; St. John, area 21 square miles, population 984. The chief towns are Christianstadt, St. Croix, and Charlotte Amalie, St. Thomas. The inhabitants are chiefly negroes engaged in sugar culture, and sugar and rum are the leading exports. The imports and exports in 1897 amounted to 409,000 kroner (\$109,612) and 136,000 kroner (\$36,448) respectively. It is said that on account of the exclusion of the sugar of these islands from the United States market they have become a source of expense to Denmark.

DARFUR occupies a western portion of eastern Soudan, lying just north of the Bahr-el-Ghazal province, and east of Wadai. Its area is estimated at about 200,000 square miles; population, 1,500,000. England's influence there was settled by agreements with Germany and Italy in 1890-91. England's claim is further strengthened by her position in Egypt as a guarantor of the restoration to the latter power of her authority over the lost provinces of the Soudan. The recent French expedition toward the Nile, resulting in the Fashoda incident, disclosed a purpose of encroachment in the Soudan on the part of France, and resulted in an Anglo-French treaty, signed March 21, 1899. By this treaty the hitherto undefined western limit of the Soudan was definitely fixed, England agreeing not to acquire either territory or influence to the west of this new line of frontier, and France agreeing not to encroach upon the territory to the east.

DARLINGTON, SMEDLEY, ex-member of Congress, died at West Chester, Penn., June 24, 1899. He was born in 1827; in early life he was a school-teacher and newspaper reporter. He subsequently became a successful cattle dealer, and afterward a speculator in oil. He became prominent both in financial and in political circles, and in 1888 was elected to Congress, as a Republican, from the sixth Pennsylvania district.

DARTMOUTH COLLEGE, at Hanover, N. H., founded in 1769, reported in June, 1899, that the academic year just finished was the most prosperous one in its history. The curriculum had been broadened and so altered as to make it more freely elective, the teaching force had been increased, the erection and improvement of buildings had been continued, the endowment of the college had been enlarged, the alumni associations had increased in number, and a general improvement in scholarship standards was to be noted. A chair of modern history was established, to which Justin H. Smith, '77, of Boston, was elected. On September 19 the college received from Edward Tuck, class of 1862, in memory of his father, the Hon. Amos Tuck, class of 1835, who was a trustee of the college 1857-66, a gift of \$300,000, to be known as the "Amos Tuck Endowment Fund," the income from which is to be used exclusively for purposes of instruction. For statistics see **UNIVERSITIES AND COLLEGES**.

DARWINISM. See **ZOOLOGICAL LITERATURE** (paragraph General Treatises).

DASHIELL, ROBERT B., assistant naval constructor, with rank of lieutenant. U. S. N., died in Washington, D. C., March 8, 1899. He was born in Maryland in 1861, and was educated at the Naval Academy, Annapolis. He was recognized as an

expert on ordnance and was the inventor of the breech mechanism, gun mounts, and the ammunition hoist which bear his name.

DATE LINE, INTERNATIONAL. See INTERNATIONAL DATE LINE.

DAUGHTERS OF THE AMERICAN REVOLUTION, a patriotic women's society, was organized in Washington in 1890, and in 1899 had a membership of 27,000 in 492 chapters in 44 States and Territories. There are chapters in Hawaii, in England, and in Canada. Women descended from an ancestor who served in the colonies in military, naval, or civil capacity during the time of the Revolutionary War are eligible for membership. President-general, Mrs. Daniel Manning; corresponding secretary-general, Mrs. Kate Kearney Henry, 902 F Street, Washington, D. C.

DAUGHTERS OF THE KING, organized in the Protestant Episcopal Church in 1885, for the purpose of spreading "Christ's Kingdom among young women," received 968 new members in 1899. President, Mrs. E. A. Bradley; secretary, Miss Elizabeth L. Ryerson, 281 Fourth Avenue, New York City.

DAUGHTERS OF THE REVOLUTION, a women's patriotic society, was organized in New York City in 1891, and has branch societies in a number of the States of the Union. President-general, Mrs. Henry Sanger Snow; corresponding secretary-general, Miss Virginia S. Stirling. Headquarters, 156 Fifth Avenue, New York City.

DAUNT, Major-General WILLIAM, C.B., an officer in the British army, died November 27, 1899. Born March 17, 1831, and educated at private schools, he entered the military service in 1848. From 1854 to 1856 he served with the Ninth Regiment in the Crimea, being present at the siege of Sebastopol. In 1879-80 he took part in the military operations in Afghanistan. He received decorations for meritorious services at Sebastopol and Kabul.

DAVIES, General THOMAS A., was born December 3, 1809; died at Ogdensburg, New York, August 19, 1899. He graduated from the Military Academy at West Point in 1829, and served during the year following at Fort Crawford, Wis., which at that time was a frontier post. He was then appointed quartermaster at West Point and subsequently resigned to enter business in New York. At the outbreak of the Civil War he entered the Union service as colonel of the Sixteenth New York Volunteers, and was ordered to the defence of Washington. In the Army of the Potomac he was placed in command of the second brigade of the fifth division, and was engaged at Centreville. In March, 1862, he was promoted to the rank of brigadier-general of volunteers, and was assigned to the command of the second division of the Army of the Tennessee. General Davies participated in the siege and battle of Corinth, and for "gallant and meritorious conduct" was brevetted major-general of volunteers. He soon after resigned and returned to New York.

DAWSON, Sir JOHN WILLIAM, C.M.G., LL.D., F.R.S., Canadian geologist and naturalist, died November 19, 1899, at Montreal. With his death there passed away one of America's most distinguished geologists. His investigations and discoveries covered the range also of natural history, including mineralogy, botany, and zoology. His discovery of the *Eozoön canadense* in the Laurentian limestone, claimed as the earliest known form of life on the planet, and suggesting for the first time the existence of life during the eozoic period, to which the primitive rocks belong, electrified the geological world. Some geologists still doubt, however, whether the eozoön is an organic structure. His discovery of the *Dendropleuron acadianum* located the first reptile remains found in the coal formation of America. The discovery of the *Pupa vetusta*, the first known palæozoic land-snail, is also inseparably associated with his name. In a monograph published by him in 1873, he raised the number of known species of the post-pliocene fossils from thirty to over two hundred. His *Air-breathers of the Coal Period* is a complete account to date of the fossil reptile and other land animals found in the Nova Scotia coal. His two volumes on the *Devonian and Carboniferous Flora of Eastern North America*, published by the Geological Survey of Canada, and illustrated from drawings by his daughter, are among the most important contributions yet made to the palæozoic botany of North America. His scientific achievements were more noteworthy because attained in the course of an active educational and administrative career. He did not resign the principalship of McGill University until 1893, or after nearly forty years of service. Sir William Dawson was among the last great scientists since Louis Agassiz to combat the Darwinian theory of the origin of species. *The Story of the Earth and Man*, 1872, was one of his earlier important works on this subject. He has been an indefatigable writer, teacher and lecturer for nearly half of a century, his books being many, and his minor articles reaching a vast number. He belonged to many learned societies in America and Europe, and received, besides his doctor's degree from the University of Edinburgh, many honors, including the Lyle medal of the

Geological Society of London. He was created Companion of the Order of St. Michael and St. George, was a fellow of the Royal Society, president of the Royal Society of Canada, and Fellow of the Geographical Society. In 1884 he had conferred upon him the dignity of Knight Bachelor.

DAY, WILLIAM R., ex-secretary of state, was nominated by President McKinley on February 25, 1899, to be United States circuit judge of the sixth judicial circuit. He was born at Ravenna, O., April 17, 1849; was graduated at the University of Michigan in 1870; was admitted to the bar in 1872, and began practice at Canton, O. From 1886 to 1890 he was judge of the Court of Common Pleas; was appointed in 1889 judge of the United States District Court for the Northern District of Ohio, but declined the office on account of poor health. In March, 1897, he became assistant secretary of state; on April 26, 1898, succeeded Mr. John Sherman as secretary of state, and in the following September was succeeded by Colonel John Hay, his resignation being occasioned by his appointment to the chairmanship of the United States commission, which, with the Spanish commission, drew up the treaty of peace at Paris.

DEATHS. See ALCOHOL; VITAL STATISTICS.

DE GOESBRIAND, The Rt. Rev. LOUIS, Bishop of the diocese of Burlington, for many years the head of the Roman Catholic Church in Vermont, died November 3, 1899. He was born in Brittany, France, and was eighty-three years old. On the erection of the diocese of Cleveland, Bishop Rappa appointed Father DeGoesbriand his vice-general and rector of his cathedral. In 1853 he was ordained bishop, and placed over the newly erected see of Burlington, Vt. At that time there were in the State but eight churches and five priests, and no Catholic school or institution of any kind.

DELAGOA BAY indents the eastern coast of Portuguese East Africa. At the northern end on the eastern side of a landlocked inlet is the town of Lorenzo Marques, one of the chief ports of South Africa, and having special importance from the fact that it is the nearest seaport to the Transvaal, being some 52 miles from the Transvaal frontier and 350 miles from Pretoria, with which it is connected by rail. In 1899, at the time of the war between England and the Transvaal, many rumors were circulated in regard to designs on the part of Great Britain upon Delagoa Bay. The route from Lorenzo Marques to the Transvaal was the only route to the latter republic which was not under England's control. The possession of the bay and port by Portugal proved to be a great embarrassment to England and a corresponding advantage to the Transvaal, since its neutrality made it impossible for England to blockade the coast and prevent the shipment of goods to the enemy. The seizure by a British cruiser of a cargo of American flour on board a German vessel occasioned much comment at the time as a transgression of international law, and the United States State Department required its agent to investigate the matter. At the close of 1899 it was rumored that Great Britain had entered into an agreement with Germany and Portugal which would divide between Germany and England the colony of Portuguese East Africa, giving to Great Britain the country around Delagoa Bay, but the truth of this was denied from official sources. The only right which Great Britain possesses in connection with Delagoa Bay is the right of pre-emption. The origin of this was as follows: As far back as 1822 it was reported that an exploring party had secured a concession of Delagoa Bay from a native chief, and on the strength of this alleged concession Great Britain claimed the bay from Portugal. This claim was resisted and was referred in 1875 to the arbitration of Marshal MacMahon, president of the French Republic, who three years later awarded the territory to Portugal. The award contained a provision that the unsuccessful power should have from the successful power the right of pre-emption as against any other state desiring to purchase the territory. Since then there have been many reports that Great Britain had purchased the bay, but in each case they proved to be without foundation, the national pride of Portugal having stood in the way of giving up the bay to a great power. Of recent years the Delagoa Bay Railroad has been the subject of international dispute. This line, extending from Lorenzo Marques to Pretoria, was built by a citizen of the United States, who obtained a concession from Portugal in 1883, and began the construction four years later. He died before the work was finished, and the Portuguese government, taking advantage of the technical invalidation of the contract, confiscated the line in 1889. The shareholders protested, and the governments of England and the United States took up the matter, with the result that Portugal consented to arbitration. A tribunal of arbitration met at Berne in Switzerland, and the case was still pending in 1899. In the meanwhile the road was opened for traffic in 1894.

DELAWARE, an eastern State of the United States, has an area of 2050 square miles. The capital is Dover.

Manufactures.—In the fiscal year ending June 30, 1899, the collections of internal revenue on taxable manufactures aggregated \$221,883. There were 41 single-account cigar manufactories, which used 65,946 pounds of tobacco, and had an output of 3,297,182 cigars. Fruit and grain distilleries in operation numbered 14, and the production of fruit brandy amounted to 1222 gallons. Delaware, the District of Columbia, and Maryland constitute one collection district, and further consolidated details will be found under the latter State.

Railways.—No new construction was reported in 1899, when the total mileage was 350.11.

Banks.—On October 31, 1899, there were 19 national banks in operation, the full number organized. The aggregate capital was \$2,133,985; circulation, \$767,327; deposits \$5,927,484, and reserve, \$1,712,057. The State banks, June 30, 1899, numbered 3, and had capital, \$500,000; deposits, \$1,200,000, and resources, \$2,234,300; loan and trust companies, 3, with capital, \$1,050,000; deposits, \$3,818,039, and resources, \$5,237,355; and mutual savings banks, 2, with depositors, 15,641; deposits, \$4,512,769, and resources, \$5,247,409.

Education.—At the close of the school year 1897-98 there were 14 public high schools, with 47 secondary teachers, 1104 secondary students, and 103 elementary pupils; 3 private secondary schools, with 16 teachers, 229 secondary students, and 177 elementary pupils; 1 public normal school, with 2 teachers and 24 students, and a private one, with 3 teachers and 42 students. Two colleges for men and for both sexes reported 20 professors and instructors, 138 students, 10,500 volumes in the libraries, \$23,000 in scientific apparatus, \$101,500 in grounds and buildings and \$83,000 in productive funds, and \$44,869 in total income. The last published report gave the value of all public school property as \$904,426. In 1899 there were 42 periodicals, of which 6 were dailies, 29 weeklies, and 5 monthlies.

Finances.—The last assessed property valuation available at the time of writing was that reported in 1897, which gives the total assessed valuation at \$77,632,079. The last county valuations available are: Kent, 1897, \$14,282,672; Sussex, 1897, \$10,576,232, and New Castle, 1899, \$46,196,481. On March 1, 1899, the total liabilities of the State were \$819,750; assets, including bank stocks, railroad mortgages, and miscellaneous bonds, \$1,169,419; excess of assets over liabilities, \$349,669.

Population.—As estimated by federal officials, the population on June 30, 1899, was about 188,000.

Whipping-Post Legislation.—The friends of the Delaware Union for Public Good scored a noteworthy advance in the movement for the abolition of the whipping-post, an institution long associated with the penology of the State. Heretofore it has been claimed that, as the county jails of the State were without labor or reformatory discipline, the whipping-post was necessary to deter criminals from other States seeking asylum therein. Under the direction of Chief Justice Love, a bill providing for a State work-house, in which modern prison methods should supersede the old county-jail system, was introduced in two legislatures, only to be defeated in each. At the session of 1899 the bill was again introduced and adopted. Then it was found that the new constitution forbade a State appropriation for such an institution excepting by a three-fourths vote, which it was not deemed wise to risk. Whereupon Judge Love substituted an amended bill, making the proposed institution a county instead of a State one, and secured its passage with an appropriation of \$100,000. When the new work-house is completed the advocates of the whipping-post will have lost their chief argument for its retention.

New Incorporation Law.—Another important measure adopted by the legislature of 1899 was a law for the encouragement of the chartering by the State of corporations representing unusually large combinations of capital or industrial interests. Both Delaware and West Virginia took the cue from New Jersey. From March 10, when the law was adopted, till mid-October, out of all companies incorporated in Delaware, 31 represented an authorized capital of \$250,700,000. The largest were the Union Steel and Chain Company, \$60,000,000; the United States Vehicle and the Federal Sewer Pipe Companies, each \$25,000,000, and the American Grass Twine, American Pneumatic Service, and the Pennsylvania Milk Companies, each \$15,000,000. Of those below the last figure, one was for \$12,000,000, another for \$10,000,000, eleven between that and \$1,000,000, and thirteen for \$1,000,000 each. The incorporating of such companies, which was kept up fairly well through the year, proved a very profitable industry for the State.

Other Legislation.—Besides the legislation mentioned above, the following legislative measures may be noted: A State Board of Agriculture and Horticulture was created, and orchards and nursery stock will be inspected and penalties inflicted upon those selling stock subject to pests, insects or disease. The State Board of

Health was authorized to establish a pathological and bacteriological laboratory to prevent the spread of infectious diseases.

The Deadlock in the Legislature.—The balloting to elect a successor to United States Senator George Gray, whose term of office expired March 3, 1899, began on January 16, with 31 Republicans and 21 Democrats on joint ballot. Senator Gray was nominated by the Democratic members, and John Edward Addicks by the Union Republicans, and twenty-five other candidates also received votes. On March 1, Senator Gray was withdrawn as a candidate on account of his appointment to a United States judgeship. Mr. Addicks was voted for on every day of the contest, beginning with 15 on the first ballot and ending with 21 on the last ballot. In all, 133 ballots were taken, but the legislature adjourned *sine die* on March 13, 1899, with the vacancy unfilled. It has been the custom for the Senate to refuse to honor appointments made by governors after the adjournment of legislatures which have failed to fill senatorial vacancies occurring in the regular way at the end of full terms, and in that case Delaware will have but one senator for the next two years. It is thought that if senators, like governors, could be elected by the direct vote of the people, it would be a great relief, and legislatures could then be chosen to attend to law-making and State business rather than to forward the personal ambitions of candidates for the United States Senate.

State Officers and National Representatives.—Governor, E. W. Tunnell; secretary of state, James H. Hughes; treasurer, L. H. Ball; commissioner of insurance, Edward Fowler; attorney-general, Robert C. White; auditor, J. H. Lingo; adjutant-general, Garrett J. Hart. Supreme Court: Chief justice, Charles B. Lore; associate justices, Ignatius C. Grubb, W. C. Spruance, James Pennewill, William H. Boyce; clerk, William Virdin. The State legislature consists of 21 Democrats and 31 Republicans. Senators: Richard R. Kenney (Dem.), from Dover; the other senatorship (Rep) not yet filled. Representative: John H. Hoffecker (Rep.), from Smyrna.

DELBRUCK, HANS, a political and historical writer, who in 1899 was prosecuted for criticising the German policy of expelling the Danes from Schleswig-Holstein, has been a professor in the University of Berlin since 1885. He was born in Bergen (island of Rügen), November 11, 1848. He studied history in Heidelberg, Greifswald, and Bonn, after which he served in the war of 1870. In 1874 he taught Prince Waldemar of Prussia, the third son of the Crown Prince, until the youth's death in 1879. In 1882 he served in the house of delegates, and in 1885 in the *Reichstag*. He is the author of several books, and has been connected with important journals, including the *Politische Wochenschrift* and the *Preussischen Jahrbucher*.

DELOASSÉ, THÉOPHILE, French minister for foreign affairs, was born in Pamiers, March 1, 1852, and began life as a journalist on the staff of *La République Française*, where he wrote of foreign politics. In 1889 he entered the Chamber from Foix; in 1893 he became under secretary of the colonies; in 1894, minister of the colonies in the Dupuy cabinet, and in 1898 minister of foreign affairs in the Brisson cabinet, and dealt with the difficult question of Fashoda. In 1899 he negotiated an agreement with England regarding the Nile Valley and Central Africa. M. Deloassé was retained as foreign minister in the Waldeck-Rousseau cabinet, formed in 1899. See FRANCE (paragraphs on History).

DEMANGE, CHARLES GABRIEL EDGARD, French lawyer, who, with Labori, served as counsel for Dreyfus in 1899, was born at Versailles, April 22, 1841, where his father, an officer in the French army, was in garrison. After studying at the Lycée of Nancy, young Demange read law in Paris, and was admitted to the bar in 1862. In 1865 he obtained the *prix Lionville*, and from that time forward took the highest rank among the lawyers of the *cour d'assises* and plead some of the most important criminal affairs of the time. M. Demange has also been engaged in notable civil cases. In 1899 his name was brought before the whole world, owing to the Dreyfus affair. See FRANCE (paragraphs on History).

DEMOCRATIC CLUBS, NATIONAL ASSOCIATION OF, organized in 1888, has now a membership of 750,000. President, Chauncey F. Black. Headquarters, Hutchins Building, Washington, D. C.

DENBY, CHARLES, former United States minister to China, was a member of the Philippine commission, whose appointment was announced by President McKinley on January 17, 1899. He was born at Mount Doy, Va., in 1830, and was educated at Georgetown University, from which he received the degree of LL.D. in 1895, and at the Virginia Military Institute. After graduation he taught school for two years, studied law, and in 1852 removed to Evansville, Ind., where he practised his profession. During the Civil War he served in the Union army, and was advanced from lieutenant to colonel of the Forty-Second Indiana Volunteers, and

was later colonel of the Eightieth Indiana Volunteers. On account of wounds he was finally forced to resign his commission. In 1885 President Cleveland appointed him minister to China, in which position he remained until the early part of 1898, when he was succeeded by Mr. E. H. Conger. Mr. Denby had an important part in the negotiations that ended the Chino-Japanese war in 1895. In September, 1898, he was appointed by President McKinley a member of the commission to investigate alleged mismanagement in the War Department during the war with Spain. For an account of the commission appointed to investigate conditions in the Philippines, see UNITED STATES (paragraphs on History).

DENMARK, the smallest of the three Scandinavian kingdoms, is bounded on the north and west by the North Sea, on the east by the Cattegat, the Sound, and the Baltic Sea, and on the south by the German States. Its area, including the Farøe Islands, and the islands of the Baltic Sea, is 15,289 square miles, and it has a population, exclusive of the colonies, of about 2,300,000 inhabitants, almost entirely Scandinavian. Copenhagen, the capital, had a population in 1890 of 375,000, including the suburbs. Other principal towns are Aarhus, 33,308; Odense, 30,277; Aalborg, 19,503; Horsens, and Randers.

Production, Industry, and Commerce.—Dairy farming is one of the chief occupations. Agricultural production along certain lines is not equal to home consumption, especially in cereals, the imports of which exceed the exports. Corn is an article quite largely imported from the United States. The United States consul at Copenhagen reports serious complaints recently made against the inspection of corn leaving American ports. It was charged that certain shipments of corn have included much dust, dirt, sand, and other foreign material, effecting an increase in weight in the shipment, and damaging the corn. Cauliflower seed has recently gained importance as an article of export from Denmark, whose soil and climate favor the production of this plant and seed. The Royal Danish Ministry of Finance in August, 1899, appointed a commission to consider and report on the question whether or not protection, by duties on foreign agricultural products, would be of advantage to Danish agricultural products, and how such protection could be carried out. One of the most interesting questions connected with Danish commerce for 1899 was the great diversion of trade to sources other than Germany, and the possibilities for new trade thus opened up to other countries. It was stated that the recent expulsion of unoffending Danish subjects from Schleswig-Holstein had so stirred the patriotism of the Danes that rather than buy anything German they are gladly paying more for the goods of other countries. A special despatch to the same paper from Copenhagen stated that trade with Germany had already fallen off to the value of \$7,500,000 to \$10,000,000, compared with the previous year. One article—horseshoes—formerly imported into Denmark from Germany, was cited as an example, the value of its importation having fallen off \$250,000. It is now imported from Norway. Norwegian and to some extent Swedish merchants, it is reported, have joined in this trade war. The results offer a good opportunity for foreign countries, including the United States, to make an entrance for goods not now imported. There seems to be an especial future for American trade in Denmark. This country was fifth among the countries exporting goods to the Danes in 1896. In 1897 her place was fourth, supplanting Russia. While the trade of the latter, with that of Great Britain, Germany, and Sweden and Norway, increased little or not any, the import trade from the United States almost tripled in value in 1897. In the amount of goods exported to the United States from Denmark, this country advanced from seventh to sixth place in importance, supplanting France. As a sure sign of the increasing business relations thus noted, the United States Consular Reports for September, 1899, stated that the Copenhagen Bourse has been instructed by royal decree to quote the rate for three days' sight-drafts on New York every Tuesday and Friday. The exchange rate on places in the United States has never before been publicly quoted in Denmark. The expansion of the Danish merchant marine has been an important factor in the increase of American trade. An increase of 49 vessels, with a net tonnage of 50,000, was made to the merchant marine for 1898 alone, and nearly half of this increase was placed on the routes between Denmark and the United States. The decrease in the Danish fleet for 1898 was 17 steamers of 7000 tons net, but none of them was on an American line. The Danish merchants have for many years complained about the Danish weights and measures in use, as they do not agree with those ruling in other countries. A bill was introduced into the Danish Diet late in 1898 recommending the introduction in Denmark of the metric weights and measures system.

Finance.—The estimated revenue for the year 1898-99 was 68,568,723 kroner; the expenditure, 68,430,032 kroner; the abstract for the budget of 1899-1900 shows 68,162,192 kroner for revenue, and 67,970,912 kroner for expenditure.

Army and Navy.—The Danish army may comprise all able-bodied men who are 22 or more years of age. Such men are liable to serve for eight years in the regular

army and its reserve, and for eight years in the extra reserve. The strength of the army in 1899 was 800 officers and 9000 men, with a war footing of 1350 officers and 58,600 men, or, including the Citizens' Corps of Copenhagen and Bornholm Island, 63,300 men. By the working of changes begun in 1894, it is expected that by 1910 Denmark will have an effective force of 83,000 men. The Danish navy is maintained for coast defence purposes. Its fleet consisted in 1899 of 4 coast defence armorclads; 1 turret-ship, 1 barbette-ship, 1 torpedo-ship, 6 third-class cruisers and gun-vessels, 7 gunboats, and a flotilla of 14 first-class and 20 second-class torpedo-boats. There are also building at Copenhagen two armored ships, of 3470 tons each.

HISTORY.

Labor Interests.—The chief event of the year 1899 was the occurrence of one of the most extensive lockouts of recent years. It involved in the course of the summer some 35,000 men, and before it came to an end the number rose to 50,000, an extraordinary figure when compared with the population of Denmark. Among the general causes of the lockout may be mentioned the fact that the good industrial conditions that had prevailed for some years in Denmark provided the workmen with means for a struggle like this, at the same time that it gave them confidence in their own strength. During the last few years the work of organization has been going on among them until they have achieved a greater degree of solidarity than prevails among their employers. Their critics have blamed them for a desire to show their power, and to interfere unwarrantably with the management of business. Strikes have been frequent during recent years, and many of them have resulted in an increase of wages. This is said to have encouraged the workmen to take an aggressive attitude. In April, 1899, several unions of joiners went on a strike over a matter of wages, but without consulting their central committee. The latter, however, took charge of the affair and entered into an arrangement with the committee of employers regulating the rates. The members of the unions now refused to accept this settlement, whereupon the employers and master joiners declared a lockout of the workmen belonging to the unions. The central committee of the workmen tried anew to bring about a settlement, but the federation of joiners in Copenhagen refused to submit. The employers now published a statement of their position. They were ready to consider the means of putting an end to the lockout, but only on condition that certain principles should be accepted by the workmen. The chief of these principles were that any agreement concluded between the central committees of employers and workmen should be accepted by both sides; that the employers, master joiners, and directors should have the right of controlling the work and fixing the number of operators in their shops, and that foremen employed under special contract cannot belong to any labor union. These demands were indignantly rejected by the workmen, and the lockout continued in force. It extended to fourteen branches of the building trades. Its effect in Copenhagen was most striking. Buildings were left half finished, and many a large business came to a standstill. But in spite of the long duration of the lockout, there was no evidence of violence, and no occasion for the authorities to interfere. It was estimated that in Copenhagen alone from 26,000 to 27,000 women and children were supported at the expense of the union committees. The workmen found sympathizers among the other classes, and a number of prominent men of letters called meetings of the idle laborers, and induced them to pay visits to the museums and art schools of the city. The workmen's unions which were not involved in the lockouts turned over a large part of their earnings to the support of those without employment. On the whole, the event bore striking testimony to the unity and excellent organization of the federations, and the lockout added little, if anything, to the burden of the city's charity administration. The employers lost heavily through their inability to fulfil building contracts. Several efforts were made toward conciliation. A common committee, made up from the central committees of employers and workmen, served as a court of arbitration, but without results. The employers refused to depart from the essential conditions above stated, and the workmen would not accept these terms. In the summer of 1899 several of these conciliatory attempts were made without success. The employers now extended the lockout to several other branches of industry. After this there was a tendency toward compromise, in spite of the threat of a general strike which was made by the socialistic press. At last, on September 4, the two parties to the dispute agreed upon the terms of peace. These terms were favorable to the employers, although they were expressed in such a manner as not to offend the workmen. The principles of the agreement were as follows: First, every settlement concluded between the central committees of the two parties must be accepted by all the federations on each side; second, the employers shall have the right to direct and distribute work and to fix the number of workmen employed in every instance; third, foremen employed under special contract shall not be obliged to belong to the workmen's unions.

Parliamentary Affairs.—In the summer of 1899, M. Hoerring, the premier, influenced by the wishes of the majority in the chamber of deputies, replaced the unpopular ministers of the interior and war by new members. M. Bramsen, a former deputy, became minister of the interior; Colonel Schnack became minister of war, and M. Hoerring assumed the portfolio of justice in addition to that of finance, which he already had. The chief matter to come up before this ministry is the question of reform in judicial procedure. According to the fundamental law of the kingdom, the administration of justice must be separated from the executive department according to certain rules set forth by law, and it was further provided that publicity and oral procedure should be introduced as soon as possible, and that juries should be employed in criminal and political trials. These requirements were repeated in the revised fundamental law of 1869, but in 1899 they were still inoperative. In 1892 a committee of jurists published projects of reform dealing with the functions of judicial officers and the organization of procedure in criminal and civil cases. These matters were still awaiting settlement at the close of 1899. The old question of the respective rights of the *Landsting* and *Folkething* was prominent in 1899. According to the Danish constitution, the *Landsting*, or senate, which represents the conservative interests, has about the same rights as the *Folkething*, whose members are directly elected. Nevertheless, for many years the cabinets appointed by the king represented the Right, which was the majority in the *Landsting* alone. For nineteen years the cabinet of M. Estrup ruled, though supported only by a parliamentary minority. The succeeding cabinet, that of Reedtz-Thott, was a compromise and rather weak body. Latterly the Radicals and Socialists have become the dominant element in the chamber of deputies, and make the most of their opportunity for attacking the policy of the government. The Hoerring cabinet has shown a willingness to govern so far as possible in accordance with the wishes of both parties, but the hostility of the Radicals was evident as illustrated in 1899 by the discussion on the budget. In 1898 the cabinet had authorized the minister of war to appropriate the sum of 500,000 kroner to the fortification of Copenhagen without waiting for parliamentary sanction. When the chamber of deputies met in 1898 it condemned the action of the government, and in 1899 the debate on the subject was renewed. The matter, however, was not regarded seriously, and in general it was thought best to postpone discussion to October, 1900, when the report of the government on its disbursement of public funds would offer the fit occasion for a criticism of its policy. The subject of old-age pensions came up for discussion in 1899 in connection with a new measure supported by the Socialists. The existing law granted a pension to every person sixty years of age who is unable to procure the means of subsistence, provided such person has not committed a crime or been on the poor rates, and that his poverty be not the result of the giving of his property to his parents. The commune in which the aided person is a resident pays the pension, but one-half of the expenses of the communes are paid by the state. The criticism of the law has been that it gives money to the idle, and that it removes from the poor incentives to saving. The new bill would have greatly added to the amount of pensions. The debates on the measure resulted in much criticism of the existing law, but its fate was undecided at the close of the session.

DENNERY, or D'ENNERY, ADOLPHE PHILIPPE, one of the most prolific playwrights of the century, died in Paris, January 25, 1899. He was born of Jewish parents in Paris on the 17th of June, 1811. He attempted painting and journalism, but finally turned to dramatic work, in which he was eminently successful. His first work, written in collaboration with Charles Desnoyer, and entitled *Emile, ou le Fils d'un Pair de France*, was produced in 1831. His dramatic works, many of which were written in collaboration with other litterateurs, numbered in all about two hundred, and included comedies, vaudeville sketches, and dramas. There were times in 1862 and 1863 when five of his plays were being presented at the same time in as many Parisian theatres. In the latter part of his career he devoted some time to business and to theatrical management. Among his best known works are: *La Changement d'Uniforme*; *Une Cause Célèbre*, in collaboration with M. Mallian; the libretto of Massenet's opera *Le Cid*, in collaboration with Ed Blau and Louis Gallot; *Don Cesar de Bazan*, in collaboration with M. Dumanoir; and, together with M. Jules Verne, the dramatic versions of *Michael Strogoff* and *Le Tour du Monde en quatre vingt jours*. Among other collaborators with Dennerly were Alexandre Dumas, Gustave Lemoine, Grangé, Dugué, Plouvier, Dartois, Decourcelle, Foucher, Bresil, and Brisebarre.

DENTAL ASSOCIATION, NATIONAL, formed 1897, is composed of delegates, permanent members, and honorary members, and had in 1899 a membership of 500. President, B. Holly Smith, Baltimore; secretary, Emma Fames Chase, St. Louis, Mo. General meeting for 1900. Old Point Comfort, Va., June 26-29.

DEPEW, CHAUNCEY MITCHELL, LL.D., long prominent as an orator and railroad president, was elected as a Republican on January 18, 1899, to succeed Mr. Edward Murphy, Jr., Democrat, in the United States Senate, the vote of the joint convention of the legislature being 111 to 83. Mr. Depew was born in Peekskill, N. Y., April 23, 1834, graduated at Yale in 1856, and two years later was admitted to the bar, and in 1859 began practice in Peekskill. In 1861 and 1862 he was elected assemblyman, and in 1863 secretary of state. He was made attorney for the New York and Harlem Railroad in 1866, and for the New York Central and Hudson River Railroad in 1869, and in 1875 became general counsel for the entire Vanderbilt system of railways. He became second vice-president of the Central in 1882, and three years later succeeded to the presidency, which position he retained until 1898, when he took the place of the late Cornelius Vanderbilt as chairman of the entire Vanderbilt system of railroads. The presidency of the Central was conferred upon Mr. Samuel R. Calloway, president of the Lake Shore and Michigan Southern. Since 1860 Mr. Depew has been active in Republican politics, and in 1888 was a candidate for the presidential nomination. Senator Depew has a wide reputation as an able orator and clever after-dinner speaker. His term of office in the Senate will expire March 3, 1905.

DERMATOLOGICAL ASSOCIATION, AMERICAN, organized in 1876, had 41 members in 1899. Next annual meeting, Washington, D. C., May 1-3, 1900. President, Henry W. Stilwagon, M.D., Philadelphia; secretary, F. H. Montgomery, M.D., 100 State Street, Chicago.

DÉROULEDE, PAUL, the French politician, journalist, and Nationalist leader, who, in 1899, was arrested with Marcel-Habert and Millevoje for having incited disorder on the occasion of President Faure's funeral in Paris, is the nephew of Émile Augier, and was born in Paris, September 2, 1846. After receiving his education in the Lycée Louis le Grand, he travelled extensively in Europe and began to write. His drama, *Jean Strenner*, was represented at the Théâtre Français in 1869, and his *Hetman* at the Odéon in 1877. In 1882 he founded the Ligue des Patriotes, to unite Frenchmen in a desire for revenge. He tried to arouse enmity against Germany in Russia in 1883, and in 1884 supported General Boulanger. In 1889 he entered the Chamber, but was expelled in 1890 and resumed his literary work. Again he wrote a play, *Bertrand Du Guesclin*, which was patriotic and which found representation at the Ambigu in 1895. He was a violent anti-Dreyfusard, and early in 1899 was arrested and imprisoned for seditious conduct when Loubet was elected president of the French Republic. In 1899 he also published *Histoire d'Amour*. Two volumes, *Chants du Soldat* (1872 and 1875), became extremely popular in France. They were inspired by experiences at Sedan, where Déroulède was wounded, and by the Loire campaigns, in which he also fought. M. Déroulède is regarded as "the finest specimen of the French Chauvinist."

DESCHANEL, PAUL EUGÈNE LOUIS, president of the French Chamber of Deputies, and one of the most distinguished Socialists of the hour, was born in Brussels, February 13, 1859. He was educated at the Lycée Ste. Barbe and the Lycée Condorcet; was secretary to Marcère and Jules Simon when they were ministers of the interior; was sous-préfet of Dreux, Brest, and Meaux; and in 1881 ran for parliament, but was defeated. In 1885 he was elected from Eure-et-Loire as a moderate Republican, and immediately distinguished himself as an orator. The Sultan of Turkey decorated him with the Grand Cross of the Medjidie, and made him Grand Officer of the Osmanieh in 1883 after his speech on French interests in the East. In 1889 he was returned, and in 1891 he visited the United States on official business. In 1898 M. Deschanel was chosen by the Moderates to oppose Henri Brisson, and was elected. He is a frequent contributor to the *Débats* and *Revue Politique*, and has written several books. These include: *La Question du Tonkin*, Paris, 1883; *La Politique Française en Occanie*, with preface by M. de Lesseps, 1884; *Les Intérêts Français dans le Pacifique*, 1885; *Orateurs et hommes d'États*, 1888; *Figures de femmes*, 1899; *Figures littéraires*, 1889, and *Questions actuelles*, 1891. His last work is *La République Nouvelle*.

DESIGN, NATIONAL ACADEMY OF, founded 1826, in 1899 had 98 members. The academy maintains an art school, has a library of works on art, and holds two annual exhibitions, spring and autumn, at Fourth Avenue and Twenty-third Street. In 1899 the art school was moved to a temporary building at the new site, One Hundred and Tenth Street and Amsterdam Avenue. President, Frederick Dielman; corresponding secretary, Harry W. Watrous, 58 West Fifty-seventh Street, New York City.

DEWEY, GEORGE, Admiral of the United States Navy. The hero of the battle of Manila was in the fall of 1899 more prominently before the public than any other American in official life. He received a popular welcome upon his return to this

country, such as had never before perhaps been accorded any American army or navy officer.

Significance of the Dewey Celebrations.—Americans held Dewey in high esteem not merely because he entered the mined harbor at Manila and sank the Spanish fleet, but because by his subsequent official conduct he showed himself a diplomatist of a high order. He made himself popular by remaining in the Philippines, in spite of ill health, long after the surrender of Manila, because he felt that his presence was required there. Besides the personal qualities of the admiral, the Dewey festivities celebrated the new position in world affairs which it was felt his victory had given to America, an aspect of his work which unquestionably increased the enthusiasm with which the newly created admiral of the United States Navy was received.

The Return of Admiral Dewey from Manila.—It was nearly a year and a half from the entrance of the American fleet into the harbor of Manila before Admiral Dewey was detached from the squadron and started on his return to the United States. When, finally, he decided to come back by way of the Suez Canal, rather than overland from San Francisco, as the West had desired, the chronicles of his progress were cabled from every port he touched, from Manila, through Ceylon and Gibraltar to New York. Notwithstanding this, he arrived in New York two days before he was expected.

Celebration at New York.—Preparations elsewhere in the country were quite overshadowed by the extraordinary preparations at New York. The *Olympia* anchored in the lower bay of the harbor in the early morning of Tuesday, September 26, and the commander was at once greeted by the formal salutes due his rank. During the day he was welcomed by Rear-Admiral Sampson, of the fleet, and Rear-Admiral Philip, commandant of the navy-yard, and by the city's committee, while all over the country his arrival was made known by bells and whistles. On Wednesday he passed the harbor forts and placed the *Olympia* at the head of the waiting war-ships of Admiral Sampson's squadron. On Thursday visits were received from a large number of officials, including Governor Roosevelt and General Miles. During the afternoon Commander Baird, who had fought with Dewey under Admiral Farragut at New Orleans, presented him with the faded blue flag which Farragut had flown from the flag-ship *Hartford* on that occasion. On Thursday evening 1,200 singers of the People's Choral Union came to the *Olympia*.

The formal entertainment of Admiral Dewey by the city of New York began on Friday, September 29, and continued through September 30. These days were declared legal holidays by the city and by Governor Roosevelt for the State. Mayor Van Wyck visited Admiral Dewey on Friday morning to offer him the "freedom and unlimited hospitality of the city of New York," and to present to him a jewelled badge which the city had voted him. In the afternoon the great naval parade took place. The *Olympia* headed the line, leading the battle-ships and cruisers of Sampson's squadron, with other war-ships, escorted by nearly 400 yachts and excursion boats. The admiral walked the bridge of the flag-ship. The vessels sailed from the anchorage at Staten Island across the harbor and up the Hudson River to Grant's Tomb, where a salute in honor of the dead soldier was fired. Rounding the old school-ship the men-of-war anchored in mid-stream, and for two hours the various escorting vessels passed in review. The war-ships were illuminated in the evening and elaborate displays of fireworks were shown at various points about the Hudson and East rivers and New York Bay. The words "Welcome Dewey" shone in electric lights from the span of the Brooklyn Bridge. Over a million visitors are estimated to have been in the city on this day, and as many more on Saturday.

Saturday was the day of the land parade. In the morning Mayor Van Wyck presented a loving cup to Admiral Dewey in the name of the city. In a speech of acceptance the admiral called his captains about him and presented them to the mayor and audience as "the men who did it." In the land parade there were 31,000 men. Many naval and military officers, including General Miles and four rear-admirals, followed the admiral and Mayor Van Wyck in the line of carriages. The *Olympia* men led the main procession; Governor Roosevelt commanded 10,000 soldiers of the New York National Guard, and as many soldiers from other States followed the line of march. The celebration closed on Saturday night with an entertainment given to the *Olympia's* men at the Hotel Waldorf-Astoria.

It has been said that the pageant and decorations incident to the Dewey reception were superior to those of any similar fête ever held in this country. The keynote of the decorations was harmony, the central and enduring figure in the scheme being the creation of wood and staff known unofficially as the Dewey Arch. This monument was designed and executed by a group of eminent New York artists, who donated their work and time. A committee of well-known men from the Mural Society, headed by John La Farge, supervised the decoration of houses along the route. The arch, with its flanking pilasters, was planned by Charles R. Lamb in collaboration with a special committee of the National Sculpture Society, its prototype

being the Arch of Titus. The heroic group, "Sea Victory," surmounting the arch one hundred feet above the street, was designed by J. Q. A. Ward, and four other most striking groups were designed, respectively, by Philip Martiny, Daniel C. French, Charles H. Niehaus, and Karl Bitter. Most of the leading sculptors of the city are represented by the strikingly fine work on remaining portions of the arch or on the columns whose approaches accentuate the proportions of the main structure. The matchless beauty of the Dewey Arch gave rise to a public desire for its perpetuation in marble, and a popular subscription had already gained such proportions at the close of 1899 as to make it probable that New York would shortly possess a monument equal in dignity to and even more elaborate than the Washington Arch. See ARCHITECTURE.

Reception at Washington.—If the New York ceremonies were unprecedented in the history of the metropolis, so the Washington ceremonies, it has been said, were unprecedented in the history of the capital. On the Monday following the admiral's reception at New York, that officer was received at the White House by President McKinley and his cabinet, and on the following day escorted by them in public procession to the Capitol—an honor said never to have been paid before to any American. Eight or more State governors, with their staffs, also joined in escort. A sword, voted to him by Congress, was tendered him at the Capitol. Secretary Long and the President making addresses. On the same evening President McKinley gave one of the largest dinners in the history of the White House, covers for eighty persons being laid. Other events of the week at Washington were the admiral's formal acceptance of the house presented to him by the people through popular subscription, and his detachment, at his request, from the *Olympia*.

Receptions to Dewey in His Own State and Elsewhere.—The ceremonies at New York and Washington were followed by receptions given in honor of Admiral Dewey by his native town and State, by entertainments at his college, and in several cities, including Boston. At Montpelier, Vt., the place of his birth, Dewey reviewed on October 12 a parade in his honor, at which time he was presented with a jewelled badge by the State of Vermont. On the 13th Dewey laid the corner-stone of Dewey Memorial Hall at Norwich University, Northfield, where he had been a student in former days. On the same evening he was received by an assemblage of 25,000 people in Boston, and escorted by 10,000 war veterans to his hotel. The following morning he was escorted to the Common, where 25,000 school children sang patriotic melodies. At the city hall he received from Mayor Quincy a jewel-studded watch, the gift of the city of Boston. The *Olympia* men marched once more in the parade of the afternoon, and Admiral Dewey attended a banquet in the evening, returning to Washington on October 16, to take up his permanent residence there. The public receptions to Admiral Dewey might have continued during a still longer period had not his health required that he should retire for a time. Invitations other than those accepted were numerous, among the places planning entertainments in his honor being a number of Western and Southern cities.

The Dewey House and the Incident of its Transfer.—The gift of a house, which Admiral Dewey through a sense of delicacy had for a time hesitated to accept, brought about the only unpleasant incident in the relations of the admiral with the American people. Admiral Dewey had, some weeks after the close of his receptions throughout the country, been quietly married, his bride being the widow of General W. B. Hazen and the sister of John R. McLean, Democratic candidate for governor of Ohio. As a compliment to his wife Dewey transferred to her the deed of the new house. His action was greatly misunderstood by some of the contributors to the fund with which the house had been purchased. A not unnatural reaction from the abnormal excitement incident to Dewey's return and his reception in this country set in. The papers were for a time filled with protests against the transfer. Mrs. Dewey at once deeded the house to George Goodwin Dewey, the son of Admiral Dewey by the latter's first marriage. The newspaper agitation on the subject did not fairly represent intelligent public opinion.

As a Presidential Candidate.—Appreciation of the hero of Manila did not take the form of celebrations alone, there being widespread talk in the press, for a time, as to his possibilities as a Presidential candidate. He was mentioned principally as a candidate for the Democratic party, but as no one seemed to be certain that he was a Democrat, and as he stood for things which Democrats seemed unlikely to support, but especially because Admiral Dewey refused to consider any suggestion of the kind, the subject was not seriously discussed during the rest of the year.

DOUKHOBORTS, or the **DOUKHOBORS**, are a Russian sect which resemble the Friends, or Quakers, in refusing to take up arms in warfare or to render military service. Hence they have been relentlessly persecuted by Russia, who banished 15,000 of them to Siberia in 1799. The Doukhobors, who call themselves the "Universal Brotherhood Christians," are communists, and do not believe in a personal God. They emphasize the quality of brotherly love and are apparently con-

sistent in their living, impressing every one with their honesty, industry, and gentleness. In 1868 about 15,000 members of this sect returned from Siberia to Russia, where they have subsequently undergone punishment, imprisonment, and further exile. In 1895 they made a final refusal to enlist in the military service of Russia, and thereby brought upon themselves excessively harsh and cruel treatment. Some of the more humane Russians interceded in their behalf at this juncture, and obtained permission from the Czar for the Doukhobors to emigrate at their own expense. The first company to go out from Russia was colonized in Cyprus, through the efforts of English and Russian sympathizers in England. The site of that settlement proved an unwise selection, owing to the climatic conditions, to which the colonists were unaccustomed, and Canada was selected as the place for future colonizations, and the eventual destination of the Cyprus settlers. The first settlement in Canada was recently made, three shiploads of immigrants having arrived. The party came in chartered vessels, which sailed from Batoum, on the Black Sea. Among those who had actively interested themselves in the Russian Doukhobors was Tolstoy, and his son was in charge of one of the divisions of the emigrating party. Seven thousand Doukhobors are now settled in Canada, and it is probable that one or more additional settlements may yet be made. It appears to be the opinion of observers that these people are a valuable acquisition to the country, being law-abiding and conservative, and of prepossessing appearance and manners. They are thrifty in habit also, although their present condition is one of poverty. Those in charge of the movement call for contributions to aid the Doukhobors in recovering the outlay made for transportation and in settling in their new homes. Their value as members of a community seems to be well shown by the fact that various efforts have been made toward inducing them to settle in parts of Canada elsewhere than where they are now located.

DIALECT SOCIETY, AMERICAN, organized in 1889 to investigate dialects in the United States and Canada, has now a membership of 300. Publishes *Dialect Notes*. President, Lewis F. Mott; secretary, O. F. Emerson, Western Reserve University, Cleveland, O.

DIAMONDS have been found at several points along the glacial moraines of the western and northwestern States, and reasoning from the glacial scratches as indicating the direction of the ice-sheet which formed these moraines, Hobbs shows that they probably all came from a region to the east of James Bay, in the Canadian wilderness. The presence of diamonds has been noted from time to time in the gold placer deposits of California, and Turner enumerates six different counties comprising twelve localities.

DIELMAN, FREDERICK, American artist, who in 1899 was made president of the National Academy of Design, was born in Hamburg, Germany, December 25, 1847. He was brought to the United States at an early age, and after graduation at Calvert College went to Munich to study under Diez at the Royal Academy. In 1876 he opened his studio in New York, and in 1883 became a National Academician. He designed the mosaic panels of "Law" and "History" in the Congressional Library, has illustrated a number of books, and paints portraits, as well as historical and genre pictures.

DIET AND FOOD. See **FOODS**.

DINGLEY, NELSON, Jr., Republican member of Congress from the second Maine district, died in Washington, D. C., January 13, 1899. He was born at Durham, Me., February 15, 1832. After his graduation at Dartmouth in 1855 he studied law and was admitted to the bar, but left the profession in 1856 to become editor and proprietor of the *Lewiston Journal*, with which he maintained a connection until the time of his death. He was a member of the lower house of the Maine legislature in 1862, 1863, 1864, 1865, 1868, and 1873, and in 1863 and 1864 was speaker. He served as governor of his State in 1874-75, and in September, 1881, was elected to the Forty-second Congress to fill the vacancy occasioned by the election of Mr. William P. Frye to the United States Senate. Dingley was a member of the next Congress as a representative-at-large, and was re-elected to the succeeding Congresses up to and including the Fifty-sixth. He gave much attention to questions of American shipping and the protective tariff, and his work in Congress was ably and conscientiously performed. The present tariff schedule, which has been in force since 1897, was framed by him. He was a member of the commission that met at Quebec in August, 1898, and later at Washington, for the adjustment of differences between the United States and Canada, and at the time of his death he was chairman of the House Committee on Ways and Means. Dingley was recognized not so much as a man of legislative genius as one of untiring industry and unquestioned sincerity.

DIPHTHERIA. Expressions of doubt as to the efficacy of antitoxin are becoming rarer. Few points are better proved theoretically or practically than the value of diphtheria-antitoxin. During 1899 reports from various parts of this country and

from Europe agree in the statement that the former mortality of this disease has been about halved. The mortality from diphtheria in Denver, Col., before the introduction of antitoxin averaged 36.4 per cent. in 6 years, while since its introduction the mortality has been 11.57 per cent. in 4 years, in a total of 1177 cases. Of 607 cases treated with antitoxin the mortality reached 4.95 per cent. In San Francisco the mortality among 144 cases treated with antitoxin was 11.11 per cent. In Chicago the cases of true diphtheria treated by the Board of Health with antitoxin showed a mortality of 6.7 per cent., against a previous mortality of 35 per cent. without antitoxin. The death-rate from diphtheria in Paris has been reduced from 72.8 to 12 per 100,000 of population; in Berlin, from 125.7 to 32.4 per 100,000; in New York, from 187.5 to 45.1 per 100,000. The great reduction in the number of cases of diphtheria in New York in 1899 is ascribed to (1) the general use of antitoxin, which diminishes the severity of the cases, and thus diminishes likelihood of infection; (2) the employment of antitoxin as an immunizing agent; and (3) the more careful inspection of the schools. See SERUM THERAPY and VITAL STATISTICS.

DIPPEL, ANDREAS, German tenor, born in Cassel, Germany, November 30, 1866. He was educated at the Gymnasium of Cassel, and was employed in a banking-house for several years. He studied music in Berlin, Milan, and Vienna, and made his first appearance in Bremen in 1887, as the Steersman in *The Flying Dutchman*. Mr. Dippel has sung in Beyreuth, London, St. Petersburg, and Vienna with success, and added to his reputation in New York in 1890-92 and in 1898-99. He sings in several languages, and has a large repertoire, including Siegfried, Walter in *Die Meistersinger*, Erik in *The Flying Dutchman*, *Lohengrin*, *Tannhauser*, and many tenor rôles in the Italian and French operas.

DISARMAMENT. See HAGUE CONFERENCE.

DISCIPLES OF CHRIST, also known as the Campbellites, are a division of the Baptists. A "Jubilee Convention" was held in Cincinnati in October, which had an attendance of nearly 20,000 delegates. The Disciples of Christ reported for 1899 an increase of 210 churches and 42,781 communicants, and an increase in value of church property amounting to \$1,059,264. The total number of ministers in 1899 was 6339, with 10,298 churches and 1,118,396 communicants.

DISPENSARY ABUSE. New York City takes the lead in practical legislation to correct the abuses of dispensary management. In accordance with the bill passed by the State Legislature, April 18, 1899, and signed by the governor on the same day, the old system passed out of existence on October 1. The new law defines a dispensary as any person, corporation, institution, association, or agent whose purpose it is, either independently or in connection with any other, to furnish at any place or places, to persons non-resident therein, either gratuitously or for a compensation determined without reference to the cost or value of the thing furnished, medical or surgical advice or treatment, medicine or apparatus, provided that the moneys used by and for the purposes of said dispensary shall be derived wholly or in part from trust funds, public moneys, or sources other than the individuals constituting said dispensary. A license is necessary, and each applicant for license must take oath to the fact that the dispensary is for the public benefit; no school of medicine is obligatory, but the State Board of Charities is empowered to examine every dispensary and to move the revocation of any license which does not conform to law. No dispensary shall be conducted in a drug store or tenement house, and no person shall advertise a dispensary except one duly licensed. Violation of the law is a misdemeanor punishable by fine from \$10 to \$250, and the same penalty will be visited on any person who obtains dispensary relief by false representations. The new law will not impede any of the regular dispensaries now in existence, but it will wipe out several hundreds which have been conducted for private gain. The new law was carefully considered by the medical and pharmaceutical societies and received their approval before being placed on final passage.

The State Board of Charities has framed rules for the government of the dispensaries. Hereafter no dispensary can obtain a license until it has satisfactorily answered a list of searching questions. It is recommended that at least two women be appointed on all boards of managers in institutions treating women and children, and that both visiting and assistant physicians and surgeons be appointed for a term of 3 years, with the object of attracting young and active practitioners into the service. The new rules adopted by the board provide for a registrar and for a matron, and insist that the sexes must be separated in waiting and treatment rooms. While all emergency and evidently needy cases are to receive immediate attention, it will be the duty of the registrar when in doubt as to the financial ability of the applicant to institute an inquiry, in large cities preferably through the charity organizations, and keep a record of the result. Applicants will be admitted only after signing the required declaration, and all pass-cards must contain the penal provision of the law—namely, that disobedience of the rules established is a misdemeanor, punishable by

a fine of not less than \$10 or more than \$250. No patient may be utilized for clinical demonstration without his consent. These rules have been put into practice, and some dispensaries have been obliged to take out new licenses under the law.

DISTRIBUTION. See ZOOLOGICAL LITERATURE (paragraph Special Treatises).

DISTRICT OF COLUMBIA. The District of Columbia and the city of Washington being co-extensive are here treated jointly.

Commerce.—In the fiscal year ending June 30, 1899, the imports of merchandise aggregated in value \$192,414, an increase in a year of \$14,517; exports, none.

Railroads.—The steam railroad mileage remained stationary during 1898, and the total direct construction in 1899 was 24.88 miles.

Banks.—On October 31, 1899, there were 12 national banks in operation and 7 in liquidation. The active capital aggregated \$3,027,000; circulation, \$1,211,881; deposits, \$19,971,363, and reserve, \$7,993,583. The loan and trust companies, June 30, 1899, numbered 3, and had capital, \$3,250,000; deposits, \$12,244,228, and resources, \$16,708,410. The exchanges at the United States Clearing-house in the year ending September 30, 1899, aggregated \$117,384,285, an increase of \$16,457,623 in a year.

Education.—At the close of the school year 1897-98, the school population was 72,420; enrolment in public schools, 44,698, and average daily attendance, 34,383. There were 1107 teachers, 117 buildings used for school-houses, and public school property valued at \$3,750,000. The revenue was \$1,251,655; expenditure the same, and teachers' salaries aggregated \$769,150. There were 5 public high schools, with 122 teachers and 2956 students; 19 private secondary schools, with 135 teachers, 838 secondary students, and 1238 elementary pupils; 2 public normal schools, with 15 teachers and 539 students, and 2 private ones, with 18 teachers and 61 students. Normal training was also given in two colleges. Six colleges and universities for men and for both sexes reported 3 fellowships, 169 scholarships, 413 professors and instructors, 2723 students, 138,700 volumes in the libraries, \$96,500 invested in scientific apparatus, \$4,377,500 in grounds and buildings, and \$1,279,075 in productive funds, \$392,610 in total income, and \$43,073 in benefactions. In 1899 the Monastery and College of the Holy Land, established by the Franciscan Friars of the Holy Land, and located near the Catholic University of America, was dedicated with more than usually imposing ceremonies on September 17; and on October 12 the new College of the Holy Cross, which forms a part of the Catholic University, was also dedicated.

Municipal Utilities.—Official reports show a total of 263 miles of streets, of which 191 miles are improved, 383 miles of sewers, and 360 miles of water-mains. The water system has cost \$9,000,000, and has a capacity of 346,400,000 gallons, and the average daily consumption is 50,000,000 gallons. Street cleaning costs about \$170,000 annually, and street lighting, by gas, \$166,000; by electricity, \$60,000. The police force of 565 men costs annually \$630,000, and the fire department, of 217 men, \$280,000.

Finances.—On July 1, 1899, the total funded debt was \$15,888,200, including stocks and bonds for \$3420, on which interest has ceased. The total assessed valuation for 1899 was \$196,587,846, an increase in a year of \$5,550,904. Estimates for the maintenance of the government during the fiscal year 1900-01, sent to Congress in December, 1899, called for an appropriation of \$7,657,773 for the District.

Population.—As estimated by federal officials the population on June 30, 1899, was about 300,000.

DODD, MOSES W., a well-known retired publisher of New York City, died at his home there April 9, 1899. He was born in Bloomfield, N. J., November 11, 1813, and graduated from Princeton in 1837. He then entered the Princeton Theological Seminary, but ill-health compelled him to relinquish his studies, and in 1839 he formed a partnership with John S. Taylor, who at that time was one of the leading publishers of New York. The following year Mr. Taylor withdrew from the business, which was then carried on by Mr. Dodd. He published many works of a theological and religious nature. In 1870 he retired from the business, which has since been directed by his son, Mr. Frank H. Dodd, the firm name since 1876 having been Dodd, Mead and Company. For more than fifty years Mr. Dodd was the ruling elder of the University Place Presbyterian Church.

DOMESTIC ANIMALS. See ZOOLOGICAL SOCIETIES (paragraph American Association for the Advancement of Science).

DOMINICA, a possession of Great Britain, the largest of the Leeward Islands (*q. v.*), and constituting a presidency of that colony, has an area of 291 square miles and a population (1891) of 26,841. A large part of the inhabitants speak a French patois. The capital is Roseau (population about 4500), and the second town in importance is St. Joseph. The government is directed by a council of 6 official and 6 non-official members, nominated by the governor of the colony. The public

debt in 1899 was £70,900. Other statistics of finance and statistics of commerce have been:

	Revenue.	Expenditure.	Imports.	Exports.
1896.....	£24,905	£25,189	£64,477	£51,438
1897.....	23,610	24,061	54,074	47,416
1898.....	24,569	24,648	31,346	63,912

The aggregate entrances and clearances in foreign shipping in 1897 was 407,460 tons.

DOMINICAN REPUBLIC. See SAN DOMINGO.

DOW, LORENZO, born in Paris, Me., in 1825, died October 12, 1899. Mr. Dow was best known on account of his inventions. At the time of his death he was active president of the Dow Composing Machine Company, of New York City. During the war he invented a water-proof cartridge, which was sold by the millions to the federal government. During the last fifteen years of his life he devoted his attention to the improvement of typesetting machinery, the most successful of his inventions in this line being his composing machine. Mr. Dow graduated in 1848 from Wesleyan University, and went soon afterward to the Pacific coast, where he became identified with the early history of Virginia City and a number of other mining towns. He later became mayor of Topeka, Kan. After the Civil War Mr. Dow spent several years in South America, where he acquired interests in gold mines and hard lumber forests. He returned to this country to become identified with the development of silver mining and with the railroad and irrigation systems of Colorado.

DRAINAGE. See MINING ENGINEERING (paragraph Drainage).

DRAMA IN 1899. *American and English.*—Several new American plays of importance were produced during the year. *The Rev. Griffith Davenport*, by James A. Herne, which had only twenty-eight representations, is the most distinctive and original of these. It is a drama of the Civil War, rich in the delineation of character, negro and other. The principal figure, the preacher Davenport, is a Northern sympathizer living in the South. His patriotism, dislike of slavery, and sense of duty lead him to express opinions contrary to those of his family and neighbors. He is forced to go North, and is asked by the Federals to guide their army into Virginia, his former home. His wife, who has followed him North, protests, but after an impressive scene of hesitation he answers the call of his country, and she goes back to her people in the South. The play is another striking example of the author's refinement and simplicity of feeling, and independence and yet skill in theatrical construction. Like many of the original plays of the year, the *Rev. Griffith Davenport* is adapted from a novel, *An Unofficial Patriot*, by Helen H. Gardener. Produced at the end of 1898, but having its first New York representation in January, 1899, *Nathan Hale*, by Clyde Fitch, is based on a well-known incident in American history. Nathan is a schoolmaster and afterward a spy in the patriot army. He is taken prisoner and identified by his emotion on being brought face to face with the girl he loves. When confronted with his immediate execution he says the historic words: "I only regret that I have but one life to give to my country." It is a dramatic, simple, almost bare presentation of a strong situation. The method contrasts strikingly with the more detailed and unconventional one employed in the *Rev. Griffith Davenport*. Based on American history also is Clyde Fitch's *Barbara Frietchie*, which has, however, nothing essentially to do with the name. Like many of Fitch's plays, it is a mixture of romance, melodrama, and elements more nearly approaching tragedy. Barbara, a young Southern girl, loves a Union soldier, and uses a musket to save him from a rebel sharpshooter. But her lover, wounded, is brought into her house, where he dies. She takes the Union flag, which he has worn next his heart, and stands on a balcony in sight of the rebels. Stonewall Jackson makes his famous remark, adapted to the necessities of the play, a jealous lover shoots and Barbara dies. Conveniently mentioned here, though of little dramatic importance, is *The Cowboy and the Lady*, also by Clyde Fitch. This play deals ostensibly with Western ranch life, but is almost a burlesque, partly unreal comedy and partly exaggerated melodrama. An interesting play from many points of view is *Becky Sharp*, adapted from Thackeray's *Vanity Fair*. It was written by Langdon Mitchell, a young American dramatist, with a view to presenting the character of Becky, a character which Mrs. Fiske has so completely made her own that the play has, although a genuine, yet partly an ephemeral interest. In spite of the opposition to Mrs. Fiske of the theatrical syndicate, *Becky Sharp* was one of the great successes of the season. *Peter Stuyvesant, Governor of New Amsterdam*, by Brander Matthews and Bronson Howard, was an unsuccessful attempt by American dramatists to draw on the increasingly interesting material of American history. *Little Italy*, a one-act play, by Horace B. Fry, presented by Mrs. Fiske, has for a setting the poor Italian quarter

of New York, and in its simplicity of passion recalls *Cavalleria Rusticana*. *Sherlock Holmes*, founded on Conan Doyle's book, by William Gillette, is the cleverest of melodramas. In spite of the perfect technical construction of *Sherlock Holmes*, most of its interest is due to the acting and personality of Mr. Gillette in the title rôle. The play is a fine example of his individuality and skill as a playwright, often shown before in war drama and farce. David Belasco, the author of some well-constructed melodramas, turned his hand this year to farce in *Naughty Anthony*. It deserves mention merely as a rare case of a logically built farce, but like the ordinary farce, of which untold numbers are produced every year, it has no intrinsic interest. *Ben-Hur*, based on Lew Wallace's novel, and arranged for the stage by William Young, is a fine example of the great spectacles which have grown so rapidly of late in popularity and mechanical splendor. The play has no connection, of course, with permanent drama, but its combination of picturesque costumes, piquant and gorgeous ballets, and marvellous scenery is most noteworthy. Of the important English plays of the year many have been produced also in America. To begin with these: *Miss Hobbs*, by Jerome K. Jerome, is a light comedy satire of the "new" woman, whom the "old" man vanquishes in the time-honored fashion. It proved very popular with society audiences. *The Tyranny of Tears*, by Haddon Chambers, was one of the best comedies of the year. Its theme is simple and typical: marriage infelicities of a gentle but insistent kind. A young husband is interrupted in his work by the necessity of amusing his wife; his bachelor friends give him up after his marriage; his useful secretary rouses the wife's jealousy, and she employs all her art of tears to get the girl dismissed. The husband, urged by his last remaining friend, makes a stand, however, and the wife runs away to her father's house. The single night that she is away, the husband and his old friend sit up late, talking and drinking. In the morning they try to restore their physical comfort by the bachelor device of champagne at breakfast, the play here pointing to the ludicrous insufficiencies of bachelorhood. The dialogue throughout shows genuine humor, the comedy is easy and sure, based upon a mature treatment of life. In this respect it differs strikingly from R. C. Carton's *Wheels Within Wheels*, which belongs to the drama of epigram directed mainly against marriage. The situation is the conventional one of a good-natured but disillusioned woman compromising herself for the sake of a married friend, but all the characters talk glittering unrealities—the sort of thing which is best done in English in the plays of Oscar Wilde and George Bernard Shaw. *The Degenerates*, by Sydney Grundy, has a plot somewhat similar to that of *Wheels Within Wheels*. In this play, however, there is no attempt to be smart. The characters are decayed members of English society without energy enough for epigram, and the play, as an unimpassioned transcript of some dead aspects of that society, has a kind of realism. Mrs. Langtry plays a part which has a striking resemblance to some of the incidents of her own life. Contrasting with these plays are adaptations of romantic novels by the author of *The Degenerates*. Sydney Grundy's *The Black Tulip* and *The Musketeers* are dramatizations of the novels of Alexandre Dumas. Another play based on Dumas's *Les Trois Mousquetaires*, is Henry Hamilton's *The King's Musketeer*, produced by the Sothorns. The material of Dumas's novels is so dramatic that little but transcription is necessary to get some kind of theatrical effectiveness, and all these plays were consequently popular. On account of the special conditions under which Israel Zangwill's play was produced, *Children of the Ghetto* was a comparative failure, although it deserved success. It is a picture of Ghetto life and characters, with fine wit and poetry in the dialogue, of quite unusual literary merit. It is so faithful to the types of the Ghetto Jew that publications representing the well-to-do Jewish community protested against the play as a humiliating exposé, while the journals of the Ghetto also found the play realistic, but the life portrayed interesting and even beautiful. *Robespierre*, although a French play, was written for Sir Henry Irving by Victorien Sardou, translated by Lawrence Irving, and produced in London. The tyrant of the Revolution unwittingly condemns his own son to death, afterward tries to save him, is overthrown by the committee of citizens, and dies by his own hand. There are some dramatic scenes, but the points of the play are spectacular—the aristocrats awaiting the guillotine, the fête of the Supreme Being, in which Robespierre addresses the blood-drunk worshippers and is accused by his son, the scene where Robespierre and Clarisse watch the tumbrils as they pass for their son's body, Robespierre confronting the ghosts of his victims, and the meeting of the committee. Henry Arthur Jones's latest play, *Carnac Sahib*, a military melodrama, was a failure. *Osborn and Ursyne*, by "John Oliver Hobbes," a tragedy in verse, had literary charm and fineness. *The Only Way*, a dramatization of Dickens's *Tale of Two Cities*, by Freeman Wells, was one of the big melodramatic successes of the year. *Grierson's Way*, by H. V. Esmond, portrays, in a vein somewhat like Ibsen's, a character at once fine and weak. *A Royal Family*, by Captain H. Marshall, is a pretty and fanciful light comedy. In *The Gay Lord Quex*, by Arthur W. Pinero,

there is the intellectual grace and comedy of his two preceding plays, *The Princess and the Butterfly* and *Trelawny of the Wells*, without their looseness of construction, and the effective building of *The Second Mrs. Tanqueray* without the "problem" element. As in *The Profligate*, a man with a past is betrothed to a young girl, but the subject, instead of being treated seriously, is shown in a comic light.

Drama in France.—Farce and analytic drama of society have been preponderant in the year's production. *Georgette Lencunier*, by Maurice Donnay, which plays about the conventional French situation, was a success largely because of its essentially modern and Parisian spirit, interpreted by that characteristically French artist, Mme. Réjane. *Le Torrent*, also by Donnay, is clever, too, but sombre. The plot would indicate a didactic purpose, although the purpose is not clear. An unfaithful wife, about to give birth to her lover's child, is advised by a friend to run away with the lover and throw down the gauntlet to society. A priest counsels her against it. She finally tells her husband, who drives her from the house, and in despair she throws herself into the river. *Le Berceau*, by Eugene Brieux, is a protest against divorce when there are children. A woman divorces her unfaithful husband and marries again. The presence of the child in the new ménage is a source of irritation and unhappiness. When the child is sick the first husband, the father, comes, and over the cradle the parents feel they might still have been together, while the new husband sees the force of the bond. *Le Vieux Marcheur*, by Henri Lavedan, portrays an old rake and the companions with whom he surrounds himself. *Plus Que Reine*, by Emile Bergerat, was fairly successful in Paris, where Coquelin played the part of Napoleon. It is described by French critics as merely a series of tableaux. When Julia Arthur produced it in New York it was a flat failure. *La Conscience de l'Enfant*, by Gaston Devore, is a "problem" play. A conscientious father wants his daughter to divorce her unfaithful husband. But the wife and her young daughter take the husband's side against the old man, the wife from passion, the child from a sense of duty. *La Nouvelle Idole*, by M. de Curel, is a philosophical drama which was played at Antoine's *Theatre Libre*, and enthusiastically praised by the critics. The problem is: Can a scientist sacrifice several lives in order to save thousands? A physician experiments with cancer virus on dying people in the hospital, among others a girl supposed to be dying of consumption. She recovers from consumption, but succumbs to cancer. The wife of the physician calls him an assassin; he decides to kill himself. But first, in the interest of science, he inoculates himself with the virus, after which he discusses the moral of the question with a physiologist. *Les Truands*, by Jean Richepin, is a romantic historical play somewhat in Corneille's manner, its motive a struggle between passion and duty. A very successful light comedy was *Ma Bru*, by Fabrice Carré and Paul Bilhaud, dealing with the ever-present mother-in-law. A successful farce was *La Dame de Chez Maxim*, which was also successfully produced in the United States. A complicated literary failure by an eminent man was *Le Lys Rouge*, by Anatole France.

Drama in Germany.—The year in Germany has produced little important drama. There has been nothing from Germany's great dramatist, Gerhart Hauptmann, since *Fuhrmann Henschel*. Hermann Sudermann has produced one play during the year, *Die Drei Reihersfedern*, which, interesting as literature, did not succeed on the stage. This play, which is intensely symbolistic, marks in Sudermann's work a growing tendency away from his earlier naturalism. The idealism of *Moriturus* and *John the Baptist* is accentuated in *Die Drei Reihersfedern*. The drama shows that in striving for the idealistic unreal, one may miss the idealistic real. Prince Witte, longing always for the invisible queen promised him by the "burial woman," ignores the real woman at his side until it is too late, and she is dying because he burned the last heron's feather to satisfy his burning longings, although he knew that when he did it his ideal must die. *Herostrot*, by Ludwig Fulda, is a tragedy in five acts. A fatherless boy is brought up by his blind mother to long for fame, but he has no power to do great things, and seized by nihilistic mania, burns the altar in his native city. The play was not very successful, not being in Fulda's real field, which has been described as "the world in which one chats." More in his familiar style is *Schlaraffenland*, a fairy tale of the land where good living is the main thing, and *Die Zecche* (one act). Of almost the value of an original work is Fulda's beautiful translation of *Cyrano de Bergerac*. Max Halbe, who since he wrote *Die Jugend*, has produced several failures, appeared with *Die Heimatlosen*. It portrays the various characters in a Berlin family pension kept by a Frenchwoman. A twenty-year-old girl runs away from her mother because she must marry a bore if she remains at home. She believes, too, in her artistic future, but she finds she has not much talent and less energy. She admires a man with no soul, but with energy, and is seduced and deserted by him. She jumps out of the window just as her mother comes to take her home. *Der Probekandidat*, by Max Dreyer, is a skillfully constructed play representing the conflict between the desire for freedom of

conscience and the feeling for authority. The idealism of religious liberty, as in Schiller, and in early-century plays like *Uriel Acosta*, is here suggested. *Hans*, by the same author, is a genuine comedy, supposed to be in Dreyer's best vein. "Il est grand dans son genre, mais son genre n'est pas grand" has been applied to characterize Dreyer's quality. A professor lives with his daughter on an island in the North Sea. A girl with a past comes into their life. The professor and the new-comer fall in love with each other. The professor, to whom her past matters not, will marry her, but she refuses until the professor's daughter also asks her to join the family. *Die Grossmamma* is a very successful new play of Dreyer's. *Der Goldene Käfig*, by Felix Philippi, is the story of a prince who wants to get out of his golden cage in order to do something in the world. But the idea is not sustained to the end, the play developing along the lines of a conventional love-story. Successful with people and critics were Arthur Schnitzler's three one-act plays, *Paracelsus* (in the style of Hans Sachs), *Der Gefährte* (a play on marriage), and particularly *Der Grüne Kacader*, a scene during the French Revolution in a low tavern, in which revel actors, actresses and aristocrats. This play attracted the attention of the censor. *Pauline* and *Agnes Jordan* are two serious plays by Georg Hirschfeld. *Kain*, by a young playwright, Ernst Pranger, is a modern study of insanity handled with psychological depth. *Neigung* is a "problem" play by J. J. David. After thirty years of married life, love is destroyed between husband and wife through the daily grind of poverty. Nevertheless the daughter marries a poor man, in spite of her mother's warning. *Die Liebesheirat*, by Frau A. Baumberg, is a play based on the effect of the cares of life on married happiness. See GERMAN LITERATURE.

Henrik Ibsen's new play, produced in December at Copenhagen, *When We Who Are Dead Awake*, is one of the most symbolistic of the master's works. A sculptor is inspired by a beautiful woman, who loves him, to do a great work of art. He lives for his art and rejects the woman, who becomes a woman of the world. He marries unsympathetically. Years afterward he meets the model again, and realizes that he has lost his chance for happiness by seeking the ideal of art. She scorns the great work of art with which she inspired him. It is real children she longed for. Recognizing their mistake, they die together.

DRAWBRIDGE. See BRIDGES.

DREDGES. Dredging machines or dredges, for excavating rock or earth under water, are of various forms, the most common of which are the clam-shell dredge, the dipper dredge, the continuous bucket chain dredge, and the suction dredge. The dipper dredge is especially adapted for excavating very hard material like hard-pan or blasted rock. The clam-shell and bucket dredges work best in moderately soft, tenacious material, like clay, and the suction dredge is especially efficient for excavating sand, silt, and similar soft materials.

During the year there has been at work on the Buffalo (N. Y.) breakwater construction a clam-shell dredge having a bucket capacity of 10 cubic yards. This machine is taking material from a depth of from 60 to 70 feet below the surface of the water at the rate, when operated at its full capacity, of 4000 cubic yards per day. As indicating to some extent the size of this dredge, it may be noted that the clam-shell bucket weighs, empty, 15 tons, and will hold full a load of 40 tons of clay, and the machinery is of such power that it will handle one bucket-load per minute in 65 feet of water. Two large suction dredges were begun during the year, to be employed on the New York harbor improvements. (See HARBOR IMPROVEMENTS.) These dredges will have steel hulls, and each will have sufficient force to pump sand through tubes at the rate of 40,000 tons an hour. The hoppers of each dredge are to have a capacity of 3000 tons of wet sand. The measurements of these dredges are: length, 320 feet; beam, 47 ft. 10 in.; depth, 20 ft. 6 in., and draft, loaded, 16 ft. 4 in. For pumping the sand each dredge will have two centrifugal pumps with 16 inches suction and delivery pipes, each pump being worked by a triple-expansion engine. During the year a chain-bucket dredge of large dimensions was built for the Karachi Port works in India. This dredge is 236 feet long, 42½ feet beam, 16 feet depth of hold, and 1250-ton hopper capacity. Another notable European chain-bucket dredge was put in operation during the year in Vladivostock harbor, Siberia. This dredge is 162 feet long, 33 feet wide, and 12½ feet draught. The hull is of steel. Actual tests showed this dredge to have a capacity of 457 cubic yards excavation per hour in compact clay. A suction dredge built for use on the river Volga in Russia is constructed in two parts, which can be operated as separate dredges or combined into one large dredge. Each part of this dredge has the following dimensions: length, 216 feet; width, 33½ feet; depth, 9 feet, and draught 4 ft. 8 in. A notable feature of this dredge is that it is propelled by electric power. In America the largest dipper dredge ever built was put in operation during the year on the Great Lakes. The hull dimensions of this dredge are: length, 132 feet; beam,

42¼ feet; depth, 13½ feet. The dipper capacity is 8¼ cubic yards, and the dipper weighs 16 tons. The guaranteed capacity of this dredge is from 5000 to 6000 cubic yards per ten-hour day.

DREYFUS, ALFRED. See FRANCE (paragraphs on History).

DROZ, NUMA, a former president of the Swiss confederation, and a distinguished statesman of Switzerland, died December 15, 1899, at the age of 55 years. M. Droz was born in the canton of Neuchâtel. His political career began in 1869, when he became a member of the Grand Council. He directed successively the various departments of public instruction, the interior, agriculture and commerce, and foreign affairs, and was finally chosen president of the Federal Council. He secured the enactment of the Swiss law regulating the protection of literary property, and he was one of the negotiators of the Franco-Swiss commercial treaty, concluded in 1882. He was not directly elected to the presidency of Switzerland, his occupancy of that office having come about through the death, by suicide, of President-elect Auterwert, with whom he had run as vice-president. The death of M. Auterwert occurred a few days before the appointed inauguration day.

DRY DOCKS. The most notable incident of 1899 in this line of civil engineering was probably the decision of the United States government to add four docks of the largest size to its navy yard facilities at Boston, Mass., Portsmouth, N. H., League Island, Penn., and Mare Island, Cal. Described without technicalities, a dry dock or graving dock is a masonry or timber-lined basin connecting with the harbor waters, and having approximately the form of a ship's hull, into which a vessel can be floated, and which can then be closed and emptied so as to leave the bottom of the vessel dry and available for cleaning and repairs. In Europe it is the almost universal practice to line these basins with stone or concrete masonry, but in America a timber lining has been adopted more extensively than masonry. Two of the new docks to be built by the United States—those at Boston, Mass., and Portsmouth, N. H.—will be masonry, and the other two will be timber docks. The accompanying figures show the principal dimensions of some of the leading foreign and American dry docks:

London-Blackwall, 471x65x23 feet; Tilbury, 846x70x35 feet (can be divided); Liverpool, New Canada Graving Dock, 925x94 feet, and 565x70x22.4 feet, and 768x60x22.10 feet; Birkenhead, 750x85x26.7 feet; Belfast, 800x80x25.8 feet; Glasgow, 880x83x26.6 feet; Southampton, 660x91x32.6 feet; Plymouth, 464x80x22 feet; Hull, 550x65x21.6 feet; Leith, 410x70x21 feet; Barrow, 500x60x22 feet; Newcastle, 550x80x26.8 feet; Cardiff, 618x62x27 feet; Newport, 520x65x32 feet; Barry, two docks, 747x60x28 feet (divided), and 610x65x29 feet, in construction; Antwerp, 459x81x23 feet; Bordeaux, 540x72x27 feet; Dunkirk, 622x68x26 feet; Genoa, 622x68x26 feet; Bremerhaven, 700x80x31 feet; Sydney, 640x66x20 feet, and 608x84x32 feet; Buenos Ayres, 587x65x26 feet; Chili, 617x87x30 feet; Portsmouth, N. H., 350x90x25 feet; Boston, Mass., 367½x60x25.8 feet; New York, N. Y., 459.8x85x25½ feet, and 338¼x66x25¼ feet, and 626¾x105¼x29 feet; League Island, Penn., 459.8x85x25½ feet; Norfolk, Va., 302¾x60x25 feet, and 459¾x85x25½ feet; Port Royal, S. C., 459x97x26 feet; Mare Island, Cal., 459x80½x27½ feet; Puget Sound, Wash., 618½x92.6x30 feet. Of the eleven American docks last named three only are built of masonry.

Compared with these existing dry docks, the new American docks present the following principal dimensions:

	Timber Docks.		Masonry Docks.	
	<i>Ft.</i>	<i>In.</i>	<i>Ft.</i>	<i>In.</i>
Length on coping.....	750	..	750	..
" " floor.....	726	..	726	..
Width on coping in body.....	180	..	144	6
" " at abutment.....	101	3	101	9
Width on floor in body.....	80	..	80	..
" " at entrance.....	101	..	100	..
Depth, coping to floor.....	39	3	39	3

It will be seen from the figures that while a number of foreign dry docks now built exceed in size the new United States docks, yet the latter average up well in size with foreign docks as a whole, and they exceed greatly in size any of the dry docks now in operation at American navy yards. Perhaps the most notable feature in connection with the new American docks, aside from their size, is that two of them will be constructed of masonry. At the present time a timber dock can be built for about 25 per cent. less money than a masonry dock, but engineers are quite

unanimous in the opinion that this greater cost of masonry docks is compensated for by their lower cost for repairs and their far greater durability, strength, and safety. Only one of the new timber docks has been contracted for, and the contract contains the provision that its construction may be changed to masonry should the government desire. The Bureau of Yards and Docks of the Navy Department strongly urges that all four docks shall be built of masonry, and it is quite possible that Congress may be influenced to appropriate the extra money to enable this superior construction to be adopted in place of the two timber docks now planned for.

In addition to the four new dry docks mentioned above, the United States has under construction a floating dry dock, which is claimed to be the largest ever constructed. In form a floating dry dock is practically a rectangular box of steel construction mounted on steel pontoons. One end of this box is provided with an entrance which permits a vessel to be floated into it. To sink the box below the water surface so that vessels may enter it, the pontoons are partly or wholly filled with water. After the vessel is inside and securely blocked up, the water is pumped out of the pontoons, and their buoyancy lifts the box out of the water, leaving the vessel's hull dry. A reversal of these operations sinks the pontoons and box below the water surface and enables the vessel to be floated out again. The new government floating dock is 525 feet long, 52 feet high, and 100 feet wide, and has a lifting capacity of 15,000 tons. It is now being built at the yards of the Maryland Steel Company, at Sparrows Point, Md., and, when completed, it will be towed to its location at Algiers, La. When empty and being towed the dock has a draught of 4 feet of water.

DUGGAN, Bishop JAMES, of the Roman Catholic Church, died March 27, 1899, at St. Louis. Bishop Duggan had been a patient for nearly thirty years in a sanitarium, but before that he had been a prominent officer of the church. Fifty years ago he was the associate and friend of Archbishop Kenrick, who had looked upon him, it is said, as his successor. He was born in Ireland in 1825, and came to the United States when young. After many years of service of various ranks, at St. Louis, he became in 1857 coadjutor archbishop, with the title of Bishop of Antigone, and was nominated soon afterward as Bishop of Chicago.

DUNKARDS (otherwise known as Tunkers or German Baptists), a denomination of Christians, comprise: (1) the German Baptists (Conservatives), with 2480 ministers, 820 churches, and 90,000 church members; (2) the German Baptists (Old Order), with 150 ministers, 100 churches, and 3500 members; (3) the German Baptists (Progressive), with 231 ministers, 160 churches, and 15,000 church members, and (4) the Seventh-Day Baptists (German), with 5 ministers, 6 churches, and 194 communicants. The entire Dunkard denomination includes (1899) 2866 ministers, 1086 churches, and 108,694 church members. The headquarters of the missionary and publishing activities are at Elgin, Ill. A national conference was held at Roanoke, Va., in May, and in the summer a congregation was organized for the first time in Montreal. The Progressive Brethren opened a college in Ashland, O. The next annual conference will be held at North Manchester, Ind., in June, 1900.

DUNNE, FINLEY PETER, was born in Chicago, July 10, 1867; he was educated at the public schools, and began his business career as a newspaper reporter in 1885; he was city editor of the *Chicago Times*, 1891-92, and on the editorial staff of the *Chicago Evening Post* and *Times-Herald*, 1892-97. His two books, *Mr. Dooley in Peace and in War* (1898), and *Mr. Dooley in the Hearts of His Countrymen* (1899), have been received with great favor, not only in this country, but in England, where he spent the summer of 1899.

DURAN, ÉMILE AUGUSTE CAROLUS, French painter, born in Lille in 1858, studied under Souchon, at the academy in Lille, and in Paris, and, gaining a scholarship, went to Italy. He has also lived in Spain. In 1899 he succeeded Puvis de Chavannes as president of the New Salon. His works include "La Prière du Soir," "L'Assassine," "St. Francis of Assisi," "The Lady with the Glove," and many portraits. Mr. Carolus-Duran visited the United States in 1898 and 1899. "Christ Upon the Cross" was much admired at the Salon of 1899.

DUTCH EAST INDIES, classified as territory directly under the government of the Netherlands, as vassal lands, and as confederated lands, comprise Java and Madura, almost all of Borneo, Sumatra, part of New Guinea, the Riau-Lingga archipelago, Celebes, Billiton, Banca, the Molucca archipelago, and the small Sunda islands. The total estimated area is 736,400 square miles, and at the close of 1897 the population, though not definitely determined, was placed at 34,090,000. The figures for several of the divisions were as follows: Java and Madura, 50,554 square miles—population, 25,697,701; Sumatra, 161,612 square miles—population, 3,209,037; Celebes, 71,470 square miles—population, 1,997,860; Borneo, 212,737 square miles—

population, 1,180,578; Lambok and Bali, 4065 square miles—population, 1,044,757; Riau-Liugga islands, 16,301 square miles—population, 107,861; Molucca islands, 43,864 square miles—population, 399,208. In 1896 the persons of European blood numbered 67,156, of whom five-sixths were Dutch. The religion of the natives is for the most part Mohammedan.

The administrative and executive authority of the Dutch East Indies is vested in a governor-general, assisted by a council of five members. Since July, 1893, the governor-general has been C. H. A. van der Wyck. There are many districts in the interior of Borneo, Sumatra, Celebes, and other islands in which the Dutch sovereignty is merely nominal, and some of the smaller islands are administered by their own princes, who, however, are subject to the directions of a Dutch Resident. In the islands there is a colonial army of 1359 officers and 41,750 men. The local revenues are made up chiefly from taxes, monopolies, and customs duties; the principal items of expenditure are army, navy, and general administration. The revenue and expenditure for 1898 were 139,412,904 guilders and 154,519,438 guilders respectively. The budget estimates for 1899 were: Colonial revenue, 115,666,550 guilders; Holland revenue, 17,075,964 guilders—total, 146,085,944 guilders; colonial expenditure, 116,600,742 guilders; Holland expenditure, 29,485,202 guilders—total, 132,742,514 guilders. The value of the guilder in United States currency is \$0.402. The leading exports are sugar, rice, coffee, tea, indigo, tobacco, cinchona, and tin. The total imports and exports in guilders for 1895 were 161,530,294 and 225,087,810 respectively; for 1896, imports, 168,348,633; exports, 199,630,711. At the Dutch East Indian ports there entered in 1895, 3633 vessels, aggregating 1,508,040 tons; in 1896, 3905 vessels, aggregating 1,603,620 tons. All but a small proportion of this tonnage was carried in steamers. The total length of railway lines open for traffic in the islands at the close of 1896 was 1112 miles; there were 6699 telegraph lines and 109 stations. The number of post-offices is about 300.

DUTCH GUIANA, or SURINAM, a South American possession of the Netherlands, lies between the British and French Guianas, on the west and east respectively, and has the Atlantic Ocean on the north and Brazil on the south. The country consists of sixteen districts, the total area of which is 46,060 square miles, and the population at the beginning of 1897, exclusive of negroes living in the forests, was about 64,372. Paramaribo, with about 30,000 inhabitants, is the capital. The executive authority of Dutch Guiana is vested in a governor, who is assisted by a council comprising, besides himself, three members and the attorney-general; all are appointed by the crown. The representative body of the country, with the exception of four members appointed annually by the governor, is elective in the proportion of one representative for each 200 electors. There are three cantonal and two circuit courts, besides a superior court, all of whose members are nominated by the crown. Complete religious toleration prevails. At the beginning of 1897 religious sects had the following numbers: Moravian Brethren, 25,421; Roman Catholics, 11,773; Hindus, 9698; Reformed and Lutheran, 8974; Mohammedans, 2681; Jews, 1250. Besides a normal school and two schools controlled by the Moravian Brethren and the Roman Catholics, there have been reported (for 1896) 19 public schools, with 2283 pupils, and 35 private schools, with 4847 pupils. For defence and the maintenance of order there are a small militia, civic guard, garrison, a few guard-ships, and a small number of vessels of the Dutch navy. The chief sources of the local revenue are customs, excise duties, and taxes on real and personal property; there is necessary an annual subvention from the Netherlands government. Statistics of finance and trade in guilders are:

Local revenue	Subvention.	Expenditure.	Imports.	Exports.
1896.	5,335,180	4,391,728
1897. .2,017,700	229,000	2,245,000	5,635,161	5,241,671
1898. .2,141,000	207,000	2,348,000

The value in United States currency of the guilder, or florin, is \$0.402. The chief products are cacao, sugar, bananas, coffee, maize, rice, rum, molasses, and gold. The output of gold in 1896 was 846,366 grammes. The arrivals at the ports in 1897 were 248 vessels of 107,153 tons and the clearances 253 vessels of 108,988 tons. Internal communication is effected largely by river navigation.

DWIGHT, TIMOTHY, who resigned the office of president of Yale University in 1899, was born in Norwich, Conn., November 16, 1828. After graduation at Yale in 1849, he studied theology and was tutor there until he went to Bonn and Berlin, where he studied in 1856-58. In the latter year he became professor of sacred literature and New Testament Greek at Yale Theological Seminary. He held this chair until 1886, when he became president of Yale University, which post he filled for thirteen years. Yale gave him the degrees of D.D. and LL.D.

EARTHQUAKES. The *Monthly Weather Review* gives the earthquakes for the first six months of 1899 as follows: Nicaragua, 2; Chile, 1; Haiti, 1; Cuba, 1; New Hampshire, 1; California, 9; New Mexico, 1; Washington, 1; Illinois, 2; Virginia, 2, one of which was quite violent; North Carolina, 1; Indiana, 1; Kentucky, 1; New York, 1. Several severe earthquakes occurred during the year. Thus, on the 6th of August a very hard one was felt at Messina, Italy. The city of Mexico on January 24 experienced the severest shock that it has ever felt, and the same one was noticed over the entire republic, and the day following a slight one was felt in California. Late in December a series of violent earthquake shocks occurred in the Caucasian region of Russia, affecting thirteen villages and completely destroying six, with a loss of life which was reported to reach 800. A paper by F. de Montessus de Ballore, on the earthquakes of Mexico and Spanish America, divides the latter region into six seismic centres, which in the order of their decreasing seismicity, together with the total number of recorded shocks, are as follows: Central America, 2059 shocks; Northern Andean region, 1385; Central Andes, 2884; Southern Andes, 2956; Atlantic coast of South America, 2956; Antilles, 157.

EAST AFRICA is the term applied to the British, German, and Portuguese possessions on the eastern coast of Africa, extending from Abyssinia on the north to the British colony of Natal on the south. See the articles **EAST AFRICA, BRITISH**; **EAST AFRICA, GERMAN**; and **EAST AFRICA, PORTUGUESE**.

EAST AFRICA, BRITISH, is an enormous territory, embracing over 1,000,000 square miles, and extending from Zanzibar, on the Indian Ocean, in a northwesterly direction, to the Upper Nile Valley. The Indian Ocean and Italian possessions bound it on the east, German East Africa lies to the south, French Congo and the Congo Free State bound it on the west, and on the north it touches the Egyptian Soudan. The entire territory includes three important divisions, known as (1) the **EAST AFRICA PROTECTORATE**, (2) the **UGANDA PROTECTORATE**, (3) the **ZANZIBAR PROTECTORATE**, which see for details upon these sections. British East African control is of recent date. German and Italian agreements with England in 1886, 1890, and 1891 defined the northern and southern boundaries. In 1886 the dominions of the Sultan of Zanzibar, which had formerly included the entire coast, were limited to a ten-mile strip from Cape Delgado to the Ozi River. In 1888 the Imperial British East Africa Company acquired jurisdiction over the coast from the Umba to Kifini. Control was later extended to the equatorial lakes in the interior, and in 1892 its sway extended as far as Lake Albert Edward and Uganda. The company was dissolved in 1895, and the three British protectorates mentioned were extended over its territories.

EAST AFRICA, GERMAN, with a coast line on the Indian Ocean of about 620 miles, and an area of about 380,000 square miles, lies between British East Africa on the north, British Central and Portuguese East Africa on the south, and British Central Africa and the Congo State on the west. It has a population of 4,000,000, including 1000 foreigners, of whom 700 are Germans. The region is administered by an imperial governor at the capital, Dar-es-Salaam. Bagamoyo, Saadani, Pangani, Kilwa, and Tanga are, with the capital, the principal coast cities. The products of the country are coffee, tobacco, cotton, corn, ivory, caoutchouc, gum, and copra. The imports, including cottons, ironware, rice, oil, and spirits, amounted at the latest date obtainable to about \$2,250,000; the exports, consisting principally of ivory, rubber, gums, corn, sesame, and copra, amounted to about \$1,000,000. Half the goods imported came from India and Great Britain, and about two-sevenths from Germany. The territory is naturally a productive one, and Germany has established several experiment stations and taken other steps toward developing its agricultural and trade possibilities. Among minerals there are coal, iron, and salt, and some gold. There are also valuable forests. A railway connects Tanga with Pongwe, an extension of which is being pushed toward Karagwe, a Central African state mainly under German influence. Especial attention was directed to German East Africa in 1899 by the visit of Mr. Cecil Rhodes to the German Emperor, for the purpose of negotiating for the right-of-way for telegraph and railway lines across the territory. Mr. Rhodes's special mission to Berlin was regarding the extension of the proposed "Cape to Cairo" Railway (*q. v.*) across German territory. During the past year the German government has made two important appropriations connected with the development of this possession. Early in March estimates were approved whereby the government will acquire, at a cost of 2,000,000 marks, the Usambara Railway, running from Tanga, and will complete its extension to Karagwe. An appropriation of 630,000 marks was made also for the construction of a floating dock at Dar-es-Salaam, which will be of great importance to Germany in Indian and Pacific waters.

EAST AFRICA, PORTUGUESE, fronts on the Indian Ocean, and lies, roughly, between German East Africa on the north and British South Africa on the south, being bounded on the west by British Central and British South Africa and the

Transvaal. Its area is 301,000 square miles, and its population something over 3,100,000, mostly natives. It is divided into the large districts of Mozambique and Lourenço Marques, and the smaller districts of Zambesia, Inhambane, and Gaza. The colony is administered by a royal commissioner, appointed for three years. Two important railroads extend westward from the coast, one from the port of Lourenço Marques to Pretoria and Johannesburg, in the gold and diamond regions of the Transvaal Republic, and one, farther north, from the port of Beira to the British territory known as Rhodesia. Through the influence of these railroads their Portuguese termini are becoming important ports of entry. The Zambesi River and Lake Nyassa also are becoming important highways of trade, especially for the transfer of ocean freight into the interior of the continent. Mozambique is developing an important trade with the continent and with the island of Madagascar. The value of the goods received at the various ports of Portuguese East Africa is reported as reaching the value of \$25,000,000 per annum. Two-thirds of this represents the transit trade intended chiefly for the mining regions of Johannesburg, Kimberley, and Rhodesia. The imports, 1897, at Mozambique, were £151,823, exports £160,571; at Lourenço Marques, £784,000 imports, £38,000 exports, £2,660,000 transit trade; Beira, £578,500 imports, £35,460 exports, £205,320 transit trade. The chief imports are clothing, food-stuffs, and liquors; the chief productions and exports are oil nuts and seeds, caoutchouc, and ivory. Machinery, bread-stuffs, clothing, and mining requisites make up the transit trade. The Manica and Sofala gold region is administered by the Mozambique Company; the Nyassa Company controls the region between the Rovuma, Lake Nyassa, and the Lurio, and the Zambesia and Mozambique sugar companies develop trade in other regions. Three steamship lines connect Lourenço Marques with New York. The exports to the United States, 1898, amounted to \$15,343, and the imports to \$2,897,657.

EAST AFRICA PROTECTORATE, a protectorate of British East Africa (*q. v.*), extends inland, from the Umha and the Juba, on the Indian Ocean, to the borders of the Uganda Protectorate. It has an estimated population of 2,500,000, including 13,500 Asiatics and about 400 Europeans. It is administered by a commissioner and consul-general, and is at present divided into four districts, the Coast Province, Ukamba, Tana-land, and Juha-land, under sub-commissioners. A large portion of the protectorate is still unorganized. Mombasa, the capital, has a fine, improved harbor, and has become an important trade centre. It is connected with the island of Zanzibar by cable and with the port of Lamu by telegraph. The construction of a railway, together with a telegraph line, was begun late in 1895 to connect Mombasa with Lake Victoria Nyanza, the distance being 670 miles. A report, made in July, 1899, shows good progress in the work thus far. Some 280 miles had been constructed up to March, 1899, at an expenditure of £1,945,281, or about \$9,465,737. The road was pushed some 80 miles farther by the close of November, 1899. Another piece of work, important to the capital and state, is the Macupa bridge, 1383 feet in length, connecting Mombasa, across an arm of the sea, with the mainland. This bridge, which was built within two years, was opened on July 8, 1899, and was named the Salisbury Bridge. The imports of this protectorate had a value in 1897-98 of 4,464,827 rupees, and included cotton cloths, provisions, brass, wire, beads, etc. The exports were 1,087,266 rupees, and consisted of ivory, rubber, cattle and goats, copra, gum-copal, and hides. The rupee was in 1890 equal to \$0.404 United States currency.

EASTWOOD, BENJAMIN, a well-known retired Episcopal clergyman, died in Pawtucket, R. I., January 26, 1899. He was born in Lancashire, England, July 4, 1825; prepared for the ministry at the Berkeley Divinity School and was ordained in 1846. For a time he was connected with the Wesleyan movement, but returned to the Episcopal Church, and coming to the United States was rector at Plymouth and Torrington, Conn. In 1873 he accepted a call to Pawtucket, where he was actively engaged as rector for twenty-five years. He wrote *Trials and Triumphs Among the Lowly and Cranberry Culture*.

EATON, DORMAN B., a lawyer of New York City, and for many years a prominent advocate of civil service reform, died December 23, 1899. He travelled abroad several times in pursuance of civil service studies, and was appointed by President Grant in 1873 a member of the first National Civil Service Commission. A fellow-member was George William Curtis. In 1877, at the request of President Hayes, Mr. Eaton again visited England. The result of that labor was a report upon the English service, published by order of Congress, which is considered the foundation of the present federal civil service system. Mr. Eaton later presented a report to Congress upon the New York post-office and custom house, comparing the results under the spoils system with those under the merit system, which was then beginning to be enforced in those offices. In drafting the Pendleton act, the first service measure toward federal service reform, he took a prominent part, and was a member of the first commission, under Presidents Arthur and Cleveland. In municipal

reform also he was active. In 1866 he drafted the law for creating a Metropolitan Board of Health, and the law establishing the police courts of New York City. At the joint solicitation of the Senate and House of Representatives in 1874-75, he prepared a code of laws for the District of Columbia. He was born at Hardwick, Vt., in 1823, and was graduated from the University of Vermont and the Harvard Law School. His law partner in New York City was the late George Kent, author of *Kent's Commentaries*. Among Mr. Eaton's works on political and municipal subjects are *The Independent Movement in New York*; *Civil Service in Great Britain*, and various magazine articles. He is the author also of a number of treatises on law. By his will Mr. Eaton gave \$100,000 each to Harvard and Columbia Universities for chairs in the science of government and in municipal government respectively.

ECONOMIC ASSOCIATION, AMERICAN, organized in 1885, has about 600 members; president, Arthur T. Hadley, president of Yale University; secretary, Professor Charles H. Hull, of Cornell University. It held its fourteenth annual meeting at Cornell University, December 27-29, 1899. President Hadley's address continued the same subject as he treated at the meeting in December, 1898. He then discussed "the relation of economics to politics," the general purport of his paper being that the economists should strive to regain the influence in practical political affairs which they had formerly possessed. The title of his paper at the 1899 meeting was *Economic Theory and Political Morality*, and it dealt with certain general criticisms that had been made on the position he took in his last annual address. These criticisms were based on the view that in modern society the individual is so completely a feature of his environment and of the class to which he belongs that the claim to a wider outlook—that is to say, to an understanding of the interests of society as a whole—is either pharisaical or hypocritical. President Hadley maintained that the economist should aim to disassociate himself from class interests and to consider the welfare of the whole community, and he did not think that such an aim was impossible of realization in spite of the great difficulty in the way. He characterized the doctrine that competition between classes made for progress as wholly false. Class antagonism was not the material out of which civilization was formed, but society advanced by means of competition within classes and not competition between classes. He pointed out that the benefit of competition did not accrue to the persons immediately interested, but to the whole community. The modern civilized community attempts to regulate the struggles for existence where such struggles are against the current standard of morality, and on this point he concluded that "the success of competition, so far from warranting us in the adoption of a system of political morality and the theory of political progress, based on advocacy of class interests, proves rather the advantage and even the necessity of subordinating those interests to a wider common good." Competition has broken down in the industrial world and can no longer be utilized with advantage. We are no longer willing to make such sacrifices for individualism as would be involved in the reduplication of enormously expensive plants. The competition of even twenty-five years ago would be disastrous in certain lines of manufacture. Thus, the industrial world has become to some extent a centralized system in which comparatively few are intrusted with the productive powers which were at one time scattered among many. Thus, the power both for good and evil on the part of controllers of industry has greatly enhanced, and we have those phenomena of monopoly which seem to call for legal restraint. There is no longer the same reliance placed in individual initiative to correct abuses of power, and we are trusting more and more to the interference of the public authority. There is a tendency to subordinate class interests to the general welfare, and the ideal of economists should be this wider sphere of work and thought. The same breakdown which he finds in competition he sees in the principle of representative government. The great fault of representative systems is that the member of the legislature does not represent the country as a whole, but is a mere spokesman for local interests. Hence, legislative action became a tissue of compromises without any bearing upon general political welfare. Unless there is a reaction this tendency is certain to produce bad results. The mere competition of political groups within a nation without consciousness of national ends cannot tend toward progress. Neither the statesman nor the economist can limit his views to class interests.

The discussions of the association have assumed a far more practical tone than formerly. In the meeting of 1898 the scope and methods of the census were discussed, and the criticisms upon the methods employed in previous censuses had very important results. Several of the authors of these critical papers were placed in charge of divisions in the census bureau, and it was evident in 1899 that the new census would be carried out, so far as possible, in accord with the principles which were embodied in these discussions. In the meeting at Ithaca practical questions of public policy held the leading place. The most important discussion was that on

trusts. Papers were read by Professors Ely, Emery, Durand, and Sherwood, and the practical side of the question was presented by Hon. C. S. Fairchild, formerly secretary of the treasury, and Mr. James B. Dill, who has been associated as counsel and director of some of the largest industrial corporations. As to the practical expedients, both Mr. Fairchild and Mr. Dill agreed that a great safeguard would be a well-prepared plan of publicity. It was argued that there was real danger involved in the excessive capitalization of trusts, and that the results were, in the first place, excessive fluctuations of securities and the element of speculation on account of inaccurate information; in the second place, the improper payment of dividends out of capital accounts; and in the third place, the creation of artificial capital by an arbitrary raising of the prices or by depreciation of wages. It was urged by Mr. Dill that these tendencies would be injurious to all the corporations and to the country at large. He proposed that provision should be made by legislation for voluntary incorporation and for publicity. As a result of this he maintained that the honest company would at once incorporate under this act, while those which had something to conceal would not seek incorporation and the consequent publicity. As to what this publicity should consist in Mr. Dill proposed that it should be limited to such matters as the public had a right to know—that is, that it should be reasonable, and that it must also apply to all corporations similarly situated. It should be given only to stockholders, but when it was once distributed among them it would be easily accessible to the outside world. Against this view it was urged that attempts in the past to secure publicity had failed. Other points brought out in the discussion were the enhanced demand for managing ability in connection with the growth of trusts and the suggestion was made that it was not capital which limited the development of industry in our day, but that it was the scarcity of this organizing talent. Again, the crushing out of the small competitor, with its injury to a spirit of independence and personal initiative, was emphasized. For a further discussion of this topic see the article TRUSTS.

An important feature of the meeting was the preliminary report of the Committee of Colonies. This was appointed in the meeting of December, 1898, for the purpose of obtaining information in regard to the fiscal methods and economic conditions of typical modern colonies with the object of using it as a basis for suggestions as to the principles which might apply to the government of the new dependencies of the United States. As a result of a preliminary study of the colonies of the different countries the committee reported the following general suggestions:

First. The finances of each colony should be managed exclusively for the sake of the colony and for its development, and not for the advantage of the mother country.

Second. No uniform system of detailed fiscal management for a number of colonies in different parts of the world can be established. Each colony must be considered by itself and its system must be adapted to its conditions.

Third. Each colony should, as far as possible, be made self-supporting; but the mother country may well sustain the colony's credit or make advances to be repaid at a later date.

Fourth. In undeveloped colonies whose inhabitants are not capable of managing important public works, such as railways, canals, telegraph systems, etc., these improvements may well be owned by the government and managed by government officials rather than by private companies.

Fifth. The selection of sources of revenue must in each case be determined in accordance with the economic and social conditions of the colony.

Sixth. Where the colony is so situated that the development of trade with foreign countries is the chief economic consideration, import duties should be very low or practically non-existent.

Seventh. In colonies of undeveloped economic resources the chief reliance for general government income should be on a system of internal revenue taxes. Excise duties should be levied primarily on a few articles of general consumption, like alcoholic drinks, opium, and rice. When any colony has decided advantages in the production of some specially favored commodities, like sugar, tobacco, hemp, etc., it may be desirable to impose business licenses or similar duties on them. It is even a question whether low export duties on such commodities may not advantageously be employed in exceptional cases.

Eighth. It is undesirable to utilize an octroi or a system of taxes on consumption for local purposes. Local revenue should, in most cases, be derived in a large measure from real estate, business licenses and kindred specific taxes.

Ninth. In the administration of fiscal affairs natives, wherever possible, should be utilized as officials. It should be fully understood, however, that in the last resort the desires of the United States government, expressed by the proper authority, are to be paramount and its decisions final.

Tenth. As long as any of the colonies have not attained modern industrial con-

ditions, it may be advisable to continue as far as may be possible native customs during the period of transition. For example:

It is quite possible that for some time to come the system of farming out the revenue to contractors, especially to native chiefs, should be retained.

Eleventh. For the proper administration of the fiscal system in any of the dependencies of the United States it is absolutely essential to establish a civil service, which is beyond question, as respects the ability and honesty of its personnel.

Twelfth. In those dependencies where it is difficult to secure an adequate supply of efficient native labor, the question of the admission of foreign laborers should be seriously considered. While there may be sufficient justification for the exclusion of Chinese workmen from the United States, it by no means follows that they should be excluded from the Philippines.

ECONOMICS, HOSPITAL. See NURSES, TRAINED.

ECUADOR, an equatorial republic of South America, is bounded on the north and east by Colombia, on the south by Peru, and on the west by the Pacific Ocean. The capital is Quito.

Area and Population.—The country, comprising sixteen provinces and one territory, has an area of about 120,000 square miles, and a population, according to the last official estimate, of 1,271,861; of these about 100,000 are whites (Spanish descent), 300,000 mestizos, and 870,000 Indians. Ecuador has unsettled boundary disputes with both Peru and Colombia; the controversy with the latter country concerns the region on the left bank of the Napo River. The most populous provinces are Pichincha (205,000) and Azuay (132,400), and the least populous are Esmeraldas (14,558) and Oro (32,600). The principal cities, with their estimated populations, are: Quito, 80,000; Guayaquil, 50,000; Cuenca, 25,000; Riobamba, 12,000; Loja, Ambato, and Latacunga, each about 10,000.

Government.—The constitution, dating from 1884 and modified in 1887 and 1896, vests the chief executive authority in a president, who is elected by a popular vote for a term of four years and is assisted by a cabinet of five members, responsible with himself to the congress. The president, cabinet, and seven others constitute a council of state; the chairman of this council is the vice-president, who is elected for four years in the same manner as the president, but two years later than the latter, so that he holds office during parts of two administrations. The president is Señor Eloy Alfaro; his yearly salary is 12,000 sucres. The legislative power is vested in a congress of two houses, the senate and the house of deputies. Senators are chosen by direct vote for terms of four years, there being two senators from each province and one-half of the entire number retiring every two years; deputies are elected in the same manner for terms of two years, the number being based on the proportion of one deputy for every 30,000 inhabitants. The congress convenes annually on the 10th of June. Legal electors must be Roman Catholic, able to read and write. Provincial administration is directed by governors appointed by the federal government. The Galapagos Islands, owned by Ecuador, are administered territorially. Besides inferior courts, which try both civil and criminal cases, there are courts of appeal, comprising six superior courts at different places, and the Supreme Court at Quito. Consular courts are established at Quito, Guayaquil, and Cuenca.

Army and Navy.—The regular army, comprising infantry, cavalry, and artillery, numbers 3341 officers and men, and the national militia is reported to number about 30,000 men. The so-called navy amounts practically to nothing, consisting of a torpedo launch and a transport, the complement being about 130 men.

Finance.—The revenue is derived chiefly from customs duties, about 70 per cent. being attributed to this source; other items of revenue are taxes on cacao, white rum, real estate, and tobacco, and monopolies on salt and gunpowder. The estimated revenue for both 1897 and 1898 was 9,093,551 sucres, and the estimated expenditure 11,005,141 sucres.

The foreign national bonded debt amounts to about \$3,372,916; arrangements for the purchase of these bonds, owned chiefly by English capitalists, have been made by the Guayaquil and Quito Railway Company. At the end of 1896 the internal public debt was about 7,500,000 sucres.

Since Ecuador has no mint, its coin (silver) is minted in Birmingham, England; Philadelphia, United States; and Lima, Peru. The silver coinage for 1895, 1896, and 1897 amounted to 1,895,558 sucres. The estimated amount of silver in circulation is about 3,000,000 sucres; about two-thirds of this, however, is controlled by two banks at Guayaquil. On October 1, 1899, the sucre was worth \$0.436 in United States currency. There are two banks of issue, the Bank of Ecuador and the Commercial and Agricultural Bank; other banks are the Mortgage Bank and the Territorial Bank.

An attempt is being made to effect the adoption of the gold standard in Ecuador. In November, 1898, a law was enacted, which within two years is expected to place the country on a gold basis. Up to the present time the monetary standard has been

nominally bimetallic, but practically monometallic, since there is no gold in circulation and the silver is irredeemable. The present circulation, however, is almost entirely paper issued by the banks and is redeemable only in silver. "The effect of the newly enacted law, it is believed, will be the redemption of the paper money, which will remain the circulating medium, in gold."

Industries and Commerce.—Ecuador is essentially an agricultural country; there are good prospects for mining ventures, but the industry has not been developed. Among the important products are cacao, coffee, rice, rubber, hides, cinchona bark, vegetable ivory, and tamarinds, all of which to some extent are exported. Other products are various fruits along the coast, and in the interior sugar, cereals, and cabinet and dye woods. The exploitation of rubber is important, being an industry that is remunerative and well adapted to Ecuador. Some attention has recently been given to the planting of rubber trees, as the available supply of wild trees is being speedily exhausted. According to a report of the British consul at Guayaquil, the exports of rubber from that port in 1897 amounted to 590,400 pounds, valued at \$229,831; in 1898, 932,400 pounds, valued at \$454,102. A large porportion of the rubber export that recently went to the United States is now sent to London and other European ports.

Cacao is the product of first importance, Ecuador being the greatest cacao-producing country in the world. The cultivation of cacao is carried on chiefly in the five coast provinces, where the estimated number of trees is placed at 47,200,000; other districts, however, it is said are suitable to the cultivation of this product, and as there is little difficulty in finding a market for it, the cacao acreage in Ecuador will probably increase considerably. The production has been increasing since 1836, and the cacao trade advances at the rate of about 5 or 6 per cent. a year. The reported amount received at Guayaquil in 1896 was 15,327 tons; in 1897, 14,800 tons; in the latter year the total crop was said to be 331,584 quintals (16,579 tons), but a later report placed it at 22,000 tons; the total crop for 1898 was 421,793 quintals (21,089 tons). The entire cacao production of the world, excepting that of Mexico and the Central American states, which satisfies little more than local demand, was reported to be 75,680 tons, of which all but 11,210 tons was produced on the American continent; the 22,000 tons of Ecuador came from the five provinces, as follows: Los Rios, 12,000; Guayas, 4000; El Oro, 3000; Manavi, 2200; Esmeraldas, 800. The cost of cultivating cacao is comparatively small, the net profit being, it is said, from 40 per cent. to 50 per cent. a year; in 1898 the price per 100 pounds at Guayaquil was from 25 sucres to 30.5 sucres (\$12.17 to \$14.84).

The mining industry is almost limited to the taking of gold, though it is known that the country is rich in copper, lead, iron, and coal. Besides the washings of the Indians, gold is taken chiefly at Zarama in the province of Oro, and at Esmeralda; silver is found at Pillzhum in the province of Cañar. Petroleum also exists, but is little utilized. Manufacturing industries are undeveloped, though there are flour-mills, saw-mills, tanneries, distilleries, and sugar, cotton, and hat factories. The principal imports are cotton, textiles, and provisions. The only manufactured article exported to any appreciable extent is straw hats. In 1897 the imports were valued at 18,004,048 sucres and the exports at 31,025,382 sucres respectively.

Shipping and Communications.—Besides about 2000 small river and coasting vessels of from 5 to 80 tons that entered and cleared at the port of Guayaquil in 1897, there entered 192 vessels, aggregating 265,208 tons, and cleared 192 vessels, with the same total tonnage. More than one-half of these was British.

There are few actual roads in Ecuador; for the most part they are merely bridle-paths. There is one highway built for 115 miles from Quito toward Guayaquil, a little more than one-fourth of the distance between the two cities. Communication in the agricultural districts west of the Andes is carried on with some success by river navigation; there are about 17 steamers of American and native build, and a large number of small boats and canoes.

Ecuador has one railway in operation; it connects Durán, opposite Guayaquil, with Chimbo, 58 miles distant. Work on the construction of the Guayaquil and Quito Railway was begun on July 16, 1899. The contract for building this road was made in June, 1897, between the government of Ecuador and Mr. Archer Harman, of New York, and was approved by the congress in November, 1898. The officers of this company are Americans and the board of directors consists of fifteen Americans, three Englishmen, and three citizens of Ecuador. The cost of the road, which the government secures, is placed at \$17,532,000. The distance to be covered, formerly given as 404 miles, is now said to be about 350 miles. Quito is connected by telegraph with the cities of Colombia and with Guayaquil; the total length of telegraph lines in the country is about 1242 miles, and there are about 60 telegraph stations. A telegraphic ocean cable touches at Guayaquil.

Religion and Education.—The state religion is Roman Catholic and other churches are excluded. Primary education is free and nominally compulsory. The primary

schools number 1088; secondary, 35; schools for higher education, 9; the latest report available places the number of pupils at 68,380, and of teachers at 1498. There are technical and commercial schools in Guayaquil and Quito, and in the latter city also a university with a reported enrolment of 32 professors and 216 students.

Fire in Guayaquil.—On November 27, 1899, a large conflagration in Guayaquil destroyed property valued at more than 1,500,000 sucres. Among the buildings burned were the customs house, with all its contents, the San José church, the school, or college, of San Vincente, with the museum of natural history, the bureau of physics and chemistry, and the astronomical observatory.

An Insurrection.—A revolutionary movement, seemingly inspired by the Clerical party, began in the fall of 1898 against the government of President Alfaro, and on December 1 of that year he was given dictatorial powers by the council of state. From the beginning the government party seemed to be the stronger. The decisive battle was fought at San Aucaja on January 24, 1899, when the insurgents were defeated. Tulcan, a stronghold of the rebels, or Clericals, was then taken, and early in March a proclamation of amnesty was issued by President Alfaro; according to this proclamation, amnesty was offered, not to the leaders of the rebellion, but to other insurgents who within thirty days would lay down their arms. It was reported that later in the month order was fairly well established. Far in the interior, however, it was said that the position of Protestant missionaries was still hazardous.

Confiscation of Church Property.—In the fall of the year President Alfaro, the unswerving enemy of the Clerical party, caused no small consternation by his success in having a law passed confiscating all church property to the state; this includes mines, valuable city holdings, and sugar plantations. The law provided that the property be placed under the management of a board of trustees, appointed by the president, and that the proceeds be applied to the support of the state schools. Insurrection was threatened, and the Catholic monastic orders began to convey to laymen, for fictitious considerations, the titles of their property.

EDGAR, Sir JAMES DAVID, K.C.M.G., D.C.L., speaker of the House of Commons in the Dominion Parliament since 1896, died at his home in Toronto, Ontario, July 31, 1899. He was born at Hatley, Quebec, August 10, 1841; was educated at Lennoxville and Quebec, and was admitted to the bar in 1864. In 1872 he was first elected to the Dominion Parliament, sitting for Monek, Ontario; in the following two years, during the crisis caused by the Pacific scandal, he was the Liberal whip. From 1884 he represented the riding of West Ontario in Parliament. He became a Queen's counsel in 1890 and was knighted in 1898. He was a member of the editorial staff and a director of the *Toronto Globe*, and in 1889 was chiefly instrumental in effecting the passage of the copyright act. Besides numerous political pamphlets and several works on Canadian law, he wrote: *The White Canoe; This Canada of Ours, and Other Poems; Canada and its Capital*, 1898.

EDMUNDS, PAUL CARRINGTON, ex-member of Congress, died at his home in Halifax County, Va., March 12, 1899. He was born in Halifax County, November 1, 1836; was educated privately until he entered the University of Virginia. He graduated in law at William and Mary, practised for two years at Jefferson City, Mo., and returned to his native county, where he thereafter resided. He was elected to the State Senate in 1881 and 1884; in the latter year was a delegate to the Democratic National Convention at Chicago. He served as a Democrat from 1889 to 1895 in the Fifty-first, Fifty-second, and Fifty-third Congresses.

EDUCATIONAL ASSOCIATION, NATIONAL, held its thirty-eighth annual convention at Los Angeles, Cal., in July, 1899. The three subjects of greatest interest discussed were continued education of adults after the brief period of school life, school administration, and college entrance requirements. Among the important papers delivered before the convention were a discussion of an *Educational Policy for Our New Possessions*, by Dr. W. T. Harris, commissioner of education; and *Usefulness of Universities*, by President D. S. Jordan, of Leland Stanford Junior University. The joint committee of the departments of secondary and higher education, formed in 1895, to investigate the matter of college entrance requirements, reported that "the principle of election should be recognized in secondary schools." Professor O. T. Corson, of Columbus, O., was elected president for the ensuing year. The association has about 2000 active and 8000 associate members, and a permanent invested fund of about \$65,000.

EDUCATION IN THE UNITED STATES. The year 1899 in the United States was marked by events of some importance in higher education. Three of the greatest universities in the United States inaugurated new presidents. Most popular interest was shown in the installation of Professor Arthur Twining Hadley as president of Yale University on October 18. The Rev. Dr. W. H. P. Faunce was made president of Brown University on October 17, and Professor Benjamin Ide Wheeler

was made president of the University of California on October 25. Dr. George Harris was installed as president of Amherst College on October 11, and Miss Caroline Hazard was made president of Wellesley College for women on October 3. The increase of attendance at the various schools and institutions of higher learning is noticeable, and is regarded as a gratifying index of increasing popular prosperity. A statistical account of this increase is given under the title *UNIVERSITIES AND COLLEGES (q. v.)* Two notable features in the educational progress of the year 1899 are: First, the recognition of the importance of co-ordination in the whole system of physical and mental training from the earliest years. An expression of this widespread interest in the general problems is seen in the number of literary works of the first importance on the theory of education which have appeared in the United States. Among them are the *Discussions on Education* of the late General Francis A. Walker, who was president of the Massachusetts Institute of Technology; *Talks to Teachers on Psychology*, by William James, professor of psychology in Harvard University; *Psychology and Life*, by Hugo Münsterberg, Professor James's colleague; *Letters to a Mother*, by Miss Susan E. Blow; *The Meaning of Education*, by Professor Nicholas Murray Butler, of Columbia University; and *The Psychologic Foundations of Education*, by Dr. William T. Harris, the United States commissioner of education. The second important point in the history of education in this country during the year is the continued effort which is being made in many States of the Union to sever the connection between politics and the administration of the public schools, and to organize the latter on a systematic and independent basis. It has been pointed out that a great aid in this direction is the gradually increasing interest taken by women in school problems. The most noticeable advance in separating education from politics has been seen in the reform agitation taking place in New York, Boston, Chicago, San Francisco, Milwaukee, St. Louis, Philadelphia, Baltimore, Buffalo, Detroit, and Toledo. Though the efforts of the reformers have met with defeat, as in Chicago, it is believed that defeat is not final, but that eventual victory is only postponed.

The total enrolment in schools and colleges, both public and private, during the year 1897-98 was reported as 16,687,643, this being an increase of 432,550 over the previous year. Not included in these figures are the pupils of various miscellaneous schools, such as evening schools, business and Indian schools, reform and benevolent institutions, etc., the total enrolment of such being 485,292. Hence the grand total is 17,172,935. In the public elementary schools the average length of the school term reached 143.1 days in 1897-98. The total expenditures for the public elementary or common schools in 1897-98 was \$194,020,470. The statements made in this paragraph are taken from the last report of the United States commissioner of education, and the following tables are either copied or compiled from the same report

Total number of pupils and students of all grades in both public and private schools and colleges, 1897-98.

NOTE.—The classification of States made use of in the following table is the same as that adopted by the United States census, and is as follows: *North Atlantic Division*: Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, and Pennsylvania. *South Atlantic Division*: Delaware, Maryland, District of Columbia, Virginia, West Virginia, North Carolina, South Carolina, Georgia, and Florida. *South Central Division*: Kentucky, Tennessee, Alabama, Mississippi, Louisiana, Texas, Arkansas, and Oklahoma. *North Central Division*: Ohio, Indiana, Illinois, Michigan, Wisconsin, Minnesota, Iowa, Missouri, North Dakota, South Dakota, Nebraska, and Kansas. *Western Division*: Montana, Wyoming, Colorado, New Mexico, Arizona, Utah, Nevada, Idaho, Washington, Oregon, and California.

DIVISION.	Pupils receiving elementary instruction (primary and grammar grades).		Pupils receiving secondary instruction (high-school grade) *	
	Public	Private (largely estimated).	Public.	Private (in preparatory schools, academies, seminaries, etc.)

* Approximate.

Commercial Education has in the last few years been carried on in several European countries. In Germany a commercial course was offered for the first time in the University of Leipsic in 1898, and others are now projected for Rhenish Prussia and for Magdeburg; and it is proposed to select consuls from the graduates of such schools. The Italian government aids in the support of a commercial school at Venice; and in Belgium consuls are selected from the higher commercial schools of Antwerp. In May, 1899, an international congress of commercial education was held at Venice.

In the United States commercial education began as early as 1840. In 1890 there were 263 business schools, with 78,920 students, which in 1894 had grown to 518 schools and 115,748 students; but in 1898 there were only 337 commercial schools and 70,950 students, the decrease being explained by business depression and the commercial courses offered in public high schools. There were in that year 172 universities and colleges, with 5869 students taking commercial or business courses. The most prominent institutions giving commercial courses are the Wharton school of finance of the University of Pennsylvania, the college of commerce of the University of California, and the college of commerce and politics, of the University of Chicago. There were 1108 public high schools giving commercial education to 31,633 students in the United States in 1898. The latest report of the commissioner of education contains the following table, showing the number of students in commercial courses in five classes of institutions in the United States for the year 1897-98:

In universities and colleges.....	5,869
In normal schools.....	5,721
In private high schools and academies.....	9,740
In public high schools.....	31,633
In commercial and business colleges.....	70,950

Total for United States.....123,913

Dental Education in the United States.—This country has led the world in the art of dentistry, its dentists having an enviable reputation both in America and in foreign lands. The specialization of dentistry was recognized in the United States as early as 1840 by the foundation of the Baltimore College of Dental Surgery. In 1884, when dentistry was first taught in the University of Berlin, in Germany, there were twelve dental schools in the United States. The dental schools of this country have a more centralized control than any other branch of education, being directed by the National Association of Dental Examiners, the National Association of Dental Faculties, and the National Dental Association, an association of practitioners. The last-named society has passed the following resolutions, which secure uniformity in the American dental colleges: "Each dental college, in order to be placed on the list of recognized colleges, must have a teaching faculty composed of at least six individuals, and said faculty must teach the following branches: Operative dentistry, dental pathology, dental prosthetics, and oral surgery; also the six branches: Anatomy, physiology, general pathology (fundamentals), materia medica and therapeutics, and general surgery. Their students must also be taught the subjects of chemistry and bacteriology in laboratories adapted to the purpose and under suitable instructors. Each college must possess, in addition, suitable lecture rooms, a well-appointed dental infirmary, and a general prosthetic laboratory, and must also furnish, in this way, systematic instruction to its students. It is inadvisable for a member of an examining board to be connected with a dental college in any capacity whatever." There are at present in the United States 52 colleges of dentistry recognized as being "of good standing" by the Association of Dental Faculties.

Education of the Colored Race.—For the year 1897-98 the total enrolment in the public schools of the sixteen former slave States and the District of Columbia was 5,620,553, the number of white pupils being 4,113,811, and of colored pupils, 1,506,742. The average daily attendance in the white schools was 2,659,809, or 64.66 per cent. of the white enrolment, and the colored schools 916,833, or 60.85 per cent. of the colored enrolment. The total expenditure for public schools in the year 1897-98 was \$31,217,479, and the part of this spent for public schools for colored children was estimated at about \$6,575,000. For the education of colored youth above the primary grade there are about 180 schools in the United States. From some of these institutions statistics are not available. To 161, however, the following figures apply:

Teachers and students in institutions for the colored race in 1897-98.

Normal Schools.—All the States but Wyoming and Nevada have public normal schools. The States having 5 or more are: New York and Pennsylvania, 15 each; Massachusetts, 10; West Virginia, Wisconsin, North Carolina, and Mississippi, 7 each; Alabama, 6; Ohio, Iowa, Minnesota, and Missouri, 5 each. The following table shows the number of normal schools of various classes, with the number of normal students:

CLASSES OF INSTITUTIONS	1895-96.		1896-97.		1897-98.	
	Institu- tions.	Students.	Institu- tions.	Students.	Institu- tions.	Students.

Manual Training Schools.—In 1896 there were 121 cities of 8000 population and over in whose public schools manual training other than drawing was taught; in 1898 the number of such cities was 146. For the year 1897-98 there were reported to the commissioner of education 114 schools distinctively for manual or industrial training, an increase of 15 over the preceding year. Of these schools, 24 were industrial schools for Indian children. For the Indian schools there were employed 272 teachers, and the attendance was 4790—2705 boys and 2085 girls.

Summary of statistics of manual and industrial training schools in the United States in 1897-98.

	Number of schools.	Different teachers of manual and industrial training.			Different pupils who received manual and industrial training.			Expenditure for manual and industrial training during 1897-98 for 86 schools.				
		Male.	Female.	Total.	Male.	Female.	Total.	For teachers.	For materials.	For new tools and repairs.	For incidentals.	Total.
United States.....	114	507	438	945	19,152	11,531	30,683	\$440,572	\$108,068	\$36,508	\$85,109	\$669,247

Education of the Blind.—The number of schools reported for 1897-98 was 36, with 383 teachers and 3744 pupils—1942 males and 1802 females. Among the courses pursued, the following may be mentioned: Kindergarten, by 467 pupils; vocal music, by 1952; instrumental music, by 1893; industrial, by 2131. The total expenditure for the support of the schools was \$707,435. The value of grounds and buildings was \$6,060,900 and of scientific apparatus, \$83,815. The total number of volumes in the libraries was 89,641.

Education of the Deaf.—The number of schools for the deaf reported for 1897-98 was 105, with 1100 instructors and 10,878 pupils. These pupils were apportioned as follows: State public schools, 9832; private schools, 483, and public day schools, 563. The total expenditures for support of the State public schools were \$2,208,704; the value of their grounds and buildings was \$11,175,933, and their libraries contained 94,269 volumes. The amount expended for the support of the public day schools was reported at \$41,675. Of the pupils in the State public schools, 3205 were taught by the "combined" system, 2946 by the oral, and 3616 by the manual, and 670 in the kindergartens.

Education of the Feeble-Minded.—In 1897-98 there were reported 29 schools, with 1049 instructors and 9232 pupils. The instructors were apportioned as follows: In school departments, 259; in industrial departments, 180; caretakers of inmates, 610. Of the total number of pupils, 1749 were enrolled in music departments and 943 in the kindergartens. Of the whole number of schools, 19 were State public schools, with 8866 inmates. The expenditures of the State public schools in 1897-98 were \$1,414,451 and the value of their grounds and buildings \$4,922,537. The 10 private schools, with 366 pupils, were distributed as follows: Connecticut, Illinois, Maryland, and Michigan, 1 each; Massachusetts and New Jersey, 3 each.

Reform Schools.—The number of schools reported in 1897-98 was 87, with 518 instructors and 18,080 pupils in the industrial departments and 23,501 pupils in the school departments, while the number of inmates, 19,771 white and 3267 colored. "The number committed to the institutions during the year was 12,773, and the number discharged was 12,003. When discharged from the schools all could read and write, and a large number had received the equivalent of a common-school education." The value of the grounds and buildings of these institutions was \$18,631,147; the total expenditures for the year amounted to \$4,116,322, of which \$569,555 were on grounds and buildings and the remainder for support.

EGYPT. A country of northern Africa, under the nominal suzerainty of the Turkish Sultan, but practically a dependency of Great Britain; bounded on the north by the Mediterranean Sea, on the east by Arabia and the Red Sea, on the south by the extensive tract known as the Egyptian Soudan, and on the west by Tripoli and the Libyan desert in the French Sahara country.

Population and Area.—In regard to the population of Egypt, including not only native residents, but tribes of nomads, a large colony of European settlers, and a floating population of foreigners, it has been possible only in recent years to obtain anything like an accurate estimate. However, the number of inhabitants has gradually increased under the improving social and other conditions of the past hundred years. Thus, Napoleon placed the population at about the beginning of the century at 2,500,000, when the people were degraded under a few royal masters. Fifty years later, as nearly as can be learned, the population was 4,500,000, and in 1875 it was 6,000,000. In 1897 a fairly accurate census was made under British supervision, and gave the population of Egypt between Wady Halfa and the Mediterranean as 9,750,000. There were 9,008,000 native Egyptians; 40,000 inhabitants from other

Ottoman states, and 574,000 Bedouins, of whom 89,000 were nomads and the rest "semi-sedentary." Foreign residents, numbering 112,500, comprised 38,000 Greeks, 24,500 Italians, 19,500 British (including 6500 Maltese and 5000 military), 14,000 French (including 4000 Algerians and Tunisians), 9000 Austrians, 1400 Russians, 1300 Germans, and a remainder divided among 10 nationalities. Some 200 Americans only live in Egypt. The capital, Cairo, has 570,000 inhabitants; Alexandria, the commercial centre, has 320,000; and Tanta, the largest inland delta town, has 57,000. Zagizig and Mansurah have 3500 each; Port Said, 4200; Suez, 17,000, and Ismailia, 7000. In Upper Egypt, Assiat has 42,000 and Keneh 24,000 inhabitants.

The area of Egypt proper, including the oases in the Libyan Desert, between the Nile and the Red Sea, and El Araish in Syria, excluding the Soudan, is about 400,000 square miles. The area of the Soudan, recently recovered by Egypt, with British co-operation, from the Mahdi, is considerably more than twice as large. Though Egypt proper has twice the area of France, habitable Egypt, stretching from the second Nile cataract to the Mediterranean, with a width along the river of five-eighths of a mile to 14 miles, is scarcely as large as Belgium, embracing but 10,500 square miles. This fertile strip practically supports the Egyptian population, and upon this fact Mr. F. C. Penfield, former United States diplomatic agent and consul-general to Egypt, has based his estimate that Egypt has a density of population of 928 to the square mile, as compared with Belgium, 540; Great Britain, 315; Germany, 224, and France, 186. To make this statement credible, he explains, in his recent book, *Present-Day Egypt*, that in Egypt practically every acre not belonging to the desert is under cultivation, sometimes producing three crops a year. It is this fact which makes it possible for 928 persons to the square mile to be supported.

Commerce and Production.—The wonderfully fertile valley of the Nile produces an annually increasing amount of cotton, sugar, and cereals, and agriculture will be still further benefited by the irrigation system soon to be completed. The commerce of Egypt is in consequence already larger than that of any other division of the continent, excepting British South Africa. The bulk of the commerce of Egypt, in particular the imports, is in the hands of Great Britain, although other countries are making a strong effort toward securing a part of the valuable Egyptian trade. Italy and Belgium have been especially active in this direction. The latest results of the efforts of Italy to procure an Eastern market for her goods is the establishment of a display house at Port Said, wherein are shown the cotton products of the Lombardy looms, the porcelain and glassware of Milan, the silk goods of Como, etc. This enterprise, established in August, 1899, took orders during the first two months to the amount of \$7720. Among other prominent departments of foreign trade are the cotton piece-goods imports, handled almost wholly by German and French firms. In woollen goods France, Italy, and Germany are strong competitors with England; America imports considerable machinery, and locomotives. In August the great Atbara bridge, for the railroad of Khartoum, was opened. The contract for this bridge had been given to an American firm, which offered to deliver the material in 42 days at a cost of \$31,629, whereas the best English offer was for delivery in 6½ months at a cost of \$51,044. This American award created much discussion in trade circles, and was resented by English firms, who believed that the contract should have been given to a British concern irrespective of the advantages afforded by foreign offers. The past few years have been marked by unusual activity in engineering works in Egypt. The great Nile dam, discussed below, has been supplemented by the construction of bridges, light railroads, and factories, especially concerns for the rapidly developing sugar industry. France, Germany, Belgium, England, and America furnish the railroad supplies. The electric trade is increasing, and there is a growing demand for pumping machinery, due to government permission to irrigate in Upper Egypt.

Egyptian imports for 1898 amounted to £11,309,049 and the exports to £12,100,308. Imports have steadily increased in recent years. Great Britain, the greatest importer into Egypt, supplies goods to the amount of 3,536,425 Egyptian pounds (the Egyptian pound being \$4.943); the amount supplied in 1897 from the United States was about 118,072 pounds. The principal imports are cotton manufactures, valued at 3,526,666 Egyptian pounds in 1897; cereals and vegetables, 1,196,409; wood and coal, 1,178,954; metals and metal goods, 1,128,867; spirits, oils, etc., 636,303; tobacco, 521,518; animals and food products, 374,848. Of the exports, which include cotton, cotton-seed, cane sugar, beets, onions, skins, drugs, and natural woods, the largest trade is that in raw cotton, valued in 1897 at 8,989,445 pounds. Cereals exported were worth 2,389,630 pounds; provisions and drugs, 645,928, and skins and leather goods, 89,244. Poor growth in the interior somewhat reduced the cotton crop of that year, but the trade in that product continues to increase annually, particularly with the United States, and has more than doubled in the last two decades. Indeed, the production of Egyptian cotton and sugar-cane may in time become a serious menace to the United States cotton and sugar trade. The cotton crop is wholly exported, and

KONGO FREE STATE

BRITISH EAST AFRICA

produces nearly \$60,000,000 a year. Of this the United States already buys \$4,000,000 worth, in spite of the extent of her own Southern cotton fields. In addition, the cotton crop of the Nile valley reduces more and more each year the dependence of British manufacturers upon the cotton producers of the United States. Ex-Consul-General Penfield says: "An average year's crop is now equal to 1,100,000 bales of 500 pounds each, sold in foreign markets at 2 cents per pound in excess of quotations for good American upland cotton. It is its fibre, nearly an inch and a half long, that gives Egyptian cotton its peculiar value, and the magical fecundity of the Nile soil permits the harvesting of a crop averaging five hundredweight to the acre. This is twice the production of the American acre and the Egyptian has no dread of frost, while he pays his labor only 15 to 18 cents per capita. His prosperity is assured so long as the Southern planter accepts the opinion that long-fibre cotton can be grown only on the Nile, and that European manufacturers will always be content to use the American common staple." He quotes as a conservative estimate the statement that within five years Egypt will produce a million and a third bales of cotton. (See COTTON AND THE COTTON INDUSTRY.) While Lower Egypt is devoted to cotton culture, Middle and Upper Egypt are largely given over to the cultivation of sugar, an Egyptian product of superior quality, which brings into the country nearly \$10,000,000 a year. Of this article also the United States is a liberal buyer. The cultivation of sugar-cane in Egypt is developing greatly, and much European capital is being invested at the present time in the erection of crushing factories supplied with the most highly perfected machineries. Large tracts are also being opened up to the growing of breadstuffs.

Irrigation and the Suez Canal.—The great dam now building at Assuan, on the Nile, is of course the greatest irrigating project of Egypt—it may be safely said that it is one of the most colossal engineering feats of any country. It has been aptly spoken of as a modern addition to the ancient Egyptian engineering tasks represented by the pyramids and the obelisks, and it is interesting to note that it is being built from the very quarries whose rock was used for the obelisks. The Assuan dam will raise the waters of the Nile nearly fifty feet and create in the midst of an African desert a lake 150 miles in length. Water will be forced by side canals through many thousands of acres, 2500 square miles being rescued from the Libyan and Nubian deserts alone. The financial benefits of this great irrigation system will fully supplement the increased agricultural production caused by it. The benefits include not only the regulation of the flooding of the Lower Nile valley and the increased amount of land watered elsewhere, but the indirect effect on railroad and foreign trade interests. The financial benefits will mean, according to present estimates, an increase of production by 25 per cent. and the addition of \$10,000,000 annually by the development of cotton culture alone. The added irrigation, it is claimed, will permanently benefit Egypt to the total amount of \$100,000,000, the estimate including the resulting sale of water, the tax on land rendered fruitful, the sale of reclaimed public lands, and the indirect revenue accruing from the country's increased prosperity and from the development of customs and railroad income. (For some details of construction see the article DAMS.) The Suez Canal, the other modern Egyptian enterprise of magnitude, again proved its value as a naval waterway by the operations of the Spanish and American fleets in 1898. It incidentally turned renewed attention to the need of a Nicaraguan or Panama route between the Atlantic and Pacific. In commenting upon the meagre American representation among commercial vessels using the Suez Canal, Consul Penfield has reported that in contrast, though American trade apparently had derived no benefit, the United States government had paid an immense sum during 1898-99 in tolls for war-ships, transports, and men, *en route* to or from the Philippines. The amount was more than had been paid the canal by this country during the previous twenty years. The fact that there was a canal for use when the emergency arose was made an argument for United States government construction of the Nicaraguan Canal. The development of Suez traffic was given as follows: For 1871, 1876, 1881, 1886, 1891, and 1896—steamers, 765, 1457, 2727, 3100, 4206, and 3407 in number for those respective years; receipts, 7,595,385, 27,631,455, 47,193,880, 54,771,075, 83,421,500, and 79,652,175 francs.

History.—The most important matter in the history of Egypt during 1899 was the reconstruction of the Soudan. A convention providing for the administration of the Soudan was signed by representatives of Great Britain and Egypt on January 19, 1899. This placed the Soudanese provinces under the Egyptian and British flags, and entrusted their government to a governor-general, who was to have the supreme military as well as civil command, and was to be appointed and removed by the Khedive, with the consent of the British government. The country was to remain under martial law with the exception of Suakim. The slave traffic was prohibited, and the importation, sale, and manufacture of firearms and distilled liquors was to be restrained. On January 21 Lord Kitchener was appointed governor-general. The

newly acquired territory was divided into seven provinces, of which four were under purely military rule—namely, Omdurman, Fashoda, Sennar, and Kassala, and three were to retain their own administration—namely, Assuan, Wady-Halfa, and Suakim—these three having been continuously under Egyptian rule. Early in January Lord Cromer, the British diplomatic agent in Egypt, announced to an assembly of sheiks that henceforth they would be under the sovereignty of Great Britain, and that the sole representative of the Queen and of the Khedive was the Sirdar. The instrument of government vests in the governor-general absolute power in the administration of the Soudan, and gives him control over every kind of property situated in the region. It further states that no Egyptian law or decree shall apply to any part of the Soudan unless it be sanctioned by the governor-general. In the course of the debate on the address from the throne in the British Parliament, the government was taxed with having made the Soudan a part of the British Empire. Lord Salisbury replied that England's authority over the possessions of the Khalifa rested on two titles—namely, the fact of conquest and the fact that the Soudanese provinces were clearly a part of the Egyptian possessions. England had secured by conquest complete political power over the Soudan, and was heir to all the authority formerly possessed by the conquered power. There was much adverse comment in France upon this settlement of the affairs of the Soudan. The French accused the British government of bad faith, and declared that it had seized territories for itself under the pretense of regaining them for Egypt. In February, on the occasion of the introduction of a supplementary army estimate for additional expenditures, including among other things the cost of the Omdurman expedition, there was some sharp criticism of the government's forward policy in Egypt, and the Liberal leader, Sir H. Campbell-Bannerman, protested against the aggressive attitude marked by the operations in the Soudan. And when a motion was made pursuant to a request of the Queen that a sum not exceeding £30,000 should be granted to Lord Kitchener, there were some adverse comments on the latter's conduct in connection with the treatment of the Madhi's tomb. The violation of that tomb, while admitted as in some degree justified as a preventive measure against fanaticism, was denounced as unworthy of a civilized power. It was defended by the government on the ground that to have allowed the tomb at Khartoum to become a focus of superstition would have imperilled the safety of the European officers who were left in command of the native troops. The military operations against the Dervishes continued during the early part of the year. Before the close of 1898—that is, on December 26—a battle was fought between a Soudanese regiment and one of the few remaining Dervish chiefs, resulting in the killing of 500 Dervishes and the capture of 1500 prisoners. The Khalifa, with a considerable body of followers, was still in the field, but the efforts to bring on a battle failed. Early in the autumn an expedition under the Sirdar found him at Jebel Gedir at the head of some 5000 men, but he fled without a battle. A little later a new expedition started out, and on November 25 the column under Colonel Wingate came up with the Khalifa's forces near Gedil, about 170 miles south of Omdurman, and won a complete victory, killing the Khalifa and his principal emirs, and taking some 9000 prisoners. Osman Digna, one of the ablest foes of England and Egypt, escaped capture, as he had done many times in the past. The overthrow of the Khalifa destroyed the last remnant of the Mahdi's power, and enabled the Sirdar to announce that "the Soudan may now be declared open."

Early in the year there was much discussion over England's supposed intention to increase the influence of Egypt by modifying the mixed tribunals. It will be remembered that in the interest of foreign powers, after the English occupation of Egypt, an international character was imparted to the tribunals, before which foreigners were brought to trial. The term of these courts was for five years, and they were renewable at the end of each five-yearly period. The British government proposed to the Khedive that they should be continued for only one year. France and Germany agreed to this, but on the understanding that the prorogation should not be repeated. The Egyptian government requested a renewal of the quinquennial arrangement, and this was granted, thus putting an end to all apprehensions in the matter. The important events in the industrial and commercial history of Egypt have been described in preceding paragraphs. For some discussion of the international aspects of Egyptian affairs, see the article FRANCE, which also contains an account of the convention of March 21, defining the limits of the two powers in the valley of the Upper Nile. See also GREAT BRITAIN; ARCHÆOLOGY; and ZOOLOGICAL STATIONS.

ELBERT, SAMUEL H., former governor of Colorado, died November 27, 1899. He was appointed governor of Colorado, then a Territory, in 1873. He was born in Ohio in 1833, graduated from Ohio University, practised law in Nebraska Territory, of whose legislative council he became a member in 1860, and in 1862 was appointed secretary of Colorado Territory for four years. He resumed the practice of law after the expiration of his term of office, and in 1875 was elected a judge of the Colorado Supreme Court.

ELECTRICAL ENGINEERING PROGRESS. The year 1899 was one of unprecedented prosperity in all branches of the electrical industry. While there was a substantial increase in the export trade in electrical machinery and supplies, the great bulk of the output was consumed in the United States. As indicating the extent of the electrical industry of this country, it may be noted that prominent authorities have estimated the total amount of capital employed in it at about \$3,250,000,000. Considerable progress has been made toward cheapening the development and transmission of electric current, and, aside from the field of pure invention, this will probably continue to be the direction of the greatest progress in electrical engineering for several years to come. In electric lighting a noteworthy development was recorded in the increased use of the long-burning, enclosed arc lamp for street lighting. Progress in electric power development was chiefly along the line of increased centralization through large plants operating with large units and in long-distance transmission of power. The use of aluminium for transmission lines in place of copper increased substantially during the year. The street railway service of the United States is now performed almost entirely by electric traction, and a very considerable development has been recorded during the year in electric motor vehicles for city cab and carriage traffic. In telegraphy the principal progress of a noteworthy character has been in telegraphing without wires. See the article **WIRELESS TELEGRAPHY**. The progress in telephony has been chiefly in the direction of a more extensive and general use of the telephone. See **ELECTRIC LIGHT AND POWER**; **ELECTRIC RAILWAYS**.

ELECTRICAL ENGINEERS, AMERICAN INSTITUTE OF, at the close of the fiscal year, April 29, 1899, reported a total membership of 1133, a net gain of 35. There were 5 deaths during the year, and 19 resignations were received. The treasurer's report showed a cash balance on hand of \$5068.38. The Institute holds monthly meetings at 12 West Thirty-first Street, New York City, and prints its transactions monthly. President, Arthur E. Kennelly, Philadelphia, Penn.; secretary, Ralph W. Pope, 26 Cortlandt Street, New York City.

ELECTRICITY used for thawing frozen water pipes. See **WATER-WORKS**.

ELECTRIC LIGHT AND POWER developments during the year have shown steady progress along established lines rather than marked departures in practice. The tendency has been consolidation, both of companies and of heretofore separate plants of the same company. In Brooklyn, for instance, a number of companies have combined recently and two immense generating stations have been built by the Edison Electric Illuminating Co., where three-phase current of 6600 volts is produced. One of these stations serves an area of 120 square miles, the current being transmitted by underground lines to ten sub-stations, from which points currents of different character, to suit the varied wants of consumers, are distributed, the current being changed by transformers to such lower voltages as may be required. By means of this plan central stations may be located at the most advantageous points for generating current, instead of near centres of distribution, thus effecting all the economies due to favorable sites, such as low ground rents and conditions favorable to receiving coal. In addition, all the latest devices for handling coal and ashes may be employed to greater advantage in large than in small stations. Whether the auxiliary power at such stations should be steam or electrical seems to be still an unsettled question. Where water-power instead of steam is used, the single, large generating station may be even more economical, and it is here that the recent developments in long transmissions, noted farther on, come into play. The generating station having been located in accordance with its particular needs, there is more freedom in the choice of sites for distribution stations.

Consolidations are not confined to electric lighting alone, but include both this and electric street railways. In fact, the tendency is for all plants furnishing light, heat, and power to come under one management, as witness the New York Gas, Electric Light, Heat, and Power Company, which controls by ownership six other light and power companies, and has an authorized capitalization of \$72,000,000, divided equally between stocks and bonds. The Monongahela Light and Power Company, with general offices at Pittsburg, Penn., now has plants at Braddock, Homestead, McKeesport, Duquesne, and Wilkinsburg.

The whole city of Buffalo began to be lighted by electricity from Niagara Falls in 1899, and during the year an extension of the great water-power electric plant at the Falls was begun, which will increase its capacity from 50,000 to 100,000 horsepower.

Long-distance transmission of electric current and high voltages are keeping pace with each other in their rapid increases in magnitude. Louis Bell, Ph.D., in the latest edition (1899) of his *Electric Power Transmission*, gives a table of facts

regarding over fifty lines in the United States and Canada operating at 10,000 volts or more, a number of them being over 25 miles in length. Eleven of these are operating at or above 20,000 volts. Nearly all the generators are of the two or the three-phase type, the cycles ranging from 25 to 133 per second, but generally being about 60. Dr. Bell says that "with well-designed glass or porcelain insulators of the quality now obtainable there is little danger of puncture or serious leakage up certainly to 20,000 volts. With the best commercial insulators, carefully tested previous to installation, even this very high voltage may be doubled without likelihood of serious trouble, provided climatic conditions are good."

The building of long transmission lines is due to the desire to make water-power available for lighting and power purposes in distant centres of population. The longest line of the sort yet built supplies current to Los Angeles, Cal., through a little over 80 miles of six No. 1 copper wires (about 9-32 inch in diameter). The water-power is developed from mountain streams east of San Bernardino, known as Santa Ana River and Bear Creek. The water is brought to the power house through about 2½ miles of tunnels and timber flumes, there being 18 tunnels, with a total length of 11,555 feet, the longest being 2074 feet, and 20 flumes, with a total length of 2662 feet. A 30-inch steel penstock supplies 82-inch Pelton impulse water wheels under an effective head of 723 feet, or 314 pounds per square inch. The wheels are direct-connected to four 750-kilowatt generators, running at a speed of 300 revolutions per minute and delivering current at 750 volts. This current is transformed to 33,000 volts for transmission. The capacity of the station early in 1899 was 4000 horse-power, but it can be increased to 6000 horse-power.

Alternating-current generators are rapidly replacing the direct type, the current, if desired, being changed subsequently at the distributing stations by means of rotary converters. In a few instances special transformers, devised by Elihu Thompson, have been installed recently to supply alternating arcs in series from a constant potential.

Storage batteries, or accumulators, are gaining in favor and use, accumulating current during hours of light load and delivering at the "peak" of the load, thus saving in cost of installation of the power plant as well as in operating expenses.

The use of enclosed arc lamps with alternating currents is still on the increase, as are also alternating arc lamps in series. Increased voltages for incandescent lighting are also being employed, going up to 220 or 440 volts.

The Nernst electric lamp has aroused great interest, but is still in the experimental stage. Alternating current is passed through a small rod of great insulating power at ordinary temperatures, but which gives a brilliant light at high temperatures. As the rod must be warmed independently by a match or otherwise before it can be lighted, a practical difficulty remains to be removed before its adoption on a commercial scale can be expected, besides which other practical difficulties exist.

The high price of copper during 1899 and the comparatively low price of aluminium has resulted in the use of the latter metal for several important transmission lines, one being at Snoqualmie Falls, Wash., and another at Hartford, Conn. At Hartford the price of copper wire was 19¼ cents per pound when the material for the line was bought against 15¼ cents per pound for the aluminium.

The number of central electric lighting stations under private ownership in the various States of the Union early in 1899 is given in the accompanying table:

Central Electric Lighting Stations in the United States Owned and Operated by Private Corporations, Firms, and Individuals. (From the American Electrical Directory for June 30, 1899.)

* Direct current incandescent.

† Alternate current incandescent.

Allowing about the same rate of increase for public as for private plants, the total number of central stations early in 1899 would have been 2710. By the close of the year it is probable that the number had increased to 2800. Many cities, it should be remembered, have two or more central stations. There has been a strong movement for municipal ownership of electric lighting plants for a number of years past. Thus far Detroit possesses the largest plant of the kind, and Chicago is the largest American city in which municipal ownership has been tried. Only a part of Chicago is yet lighted by the city plant, but if the proposed plan of utilizing the water-power at the lower end of the drainage canal is carried out by the city, all the streets of Chicago may eventually be lighted from municipal works.

Some very practical points regarding city lighting contracts were brought out at the last meeting of the American Society of Municipal Improvements by Mr. D. Hunter, Jr., chairman of the committee on electric lighting. He suggested that the meter system be made the basis of charges for arc street lighting, instead of a fixed sum for lamps of 1200 or 2000 nominal candle-power, using 330 or 480 watts, respectively, burning a certain number of hours. Under the old system a city rarely knows just what it is getting, the candle-power often running low and there being many outages. With the meter system the company would be anxious to maintain a full, constant current, as its remuneration would be increased thereby.

ELECTRIC STREET RAILWAYS are now in the decided majority in the United States, as is shown by the accompanying table. Of 1121 street railways in operation early in 1899, 966 were electric and the remaining 155 were divided as follows: Horse, 103; steam, 31; cable, 21. It is expected that the cable roads will soon disappear entirely; likewise all but the short, unimportant horse railways where local conditions do not warrant the installation of power stations. About one-fourth of all the horse

lines are in New York State, including also one-third of the mileage and 9863 of the 11,888 horses reported for the whole country. Deducting the New York State figures from the total, we have 80 lines, 400 miles of track, and 2025 horses for the rest of the country, or 5 miles of track and 25 horses per line. The bulk of the New York State mileage is in the Manhattan borough of the city of New York, and will soon give way to electric traction. Further progress, with changes from horse to electric lines, outside of New York City, will be comparatively slow for the reasons already stated. The figures for street railways operated by steam will also show a great falling off soon with the adoption of the third-rail electric system for the Manhattan Railway Company of New York. This company and the Brooklyn Elevated Railroad Company together have 113 miles of track and 433 locomotives out of the 620 miles of track and 614 locomotives shown in the table for steam lines. The total capitalization of the street railways of the United States was nearly \$1,600,000,000 when the table was compiled, but the figures are not given separately for the different classes of roads.

Dismissing from further consideration here all street railway lines except surface electric (see RAPID TRANSIT), it may be noted first that the overhead trolley continues to be almost universally employed in this country, outside of New York (Manhattan borough) and Washington. In New York the open-slot underground conduit system is being extended with rapidity, and in Washington nearly the whole city mileage is so equipped. Abroad the overhead system continues to be the one generally employed, the city of Glasgow, after a careful investigation, adopting it for its new electric railways in preference to the conduit system. Feeder wires, however, for the new lines of large railways with their immense high-tension current-generating stations are being placed underground. In road-bed construction permanence and stability are kept prominently in view. Some incline to the substitution of concrete beams or blocks for wooden ties, but this has by no means become an established practice. Cast-welded joints are being made with apparent success, and electric-welded joints are still being tried here and there. As a matter of good engineering practice, and because of the pressure brought to bear by the officials of municipalities and gas and water companies, increasing attention is being given to the bonding of rail joints to the end that the current may return to the power house through the street railway system, instead of through gas and water mains. The officials just named are vitally interested in this matter on account of its relation to electrolysis of gas and water mains, which may lead to their failure, with most serious results. Where the cast or electric-welded joints are not used the rail joints are bonded with copper wire.

An overhead trolley at one side, instead of over the centre of the car, was recently substituted for a conduit system at Blackpool, England. The side trolley was used to lessen the disfigurement of the streets by overhead construction, only one line of poles being required. The conduit system was abandoned because sand drifted into it in dry weather and water entered it at other times, the road being along a beach.

Trials were made in 1898 and 1899 of a through transportation system on country roads and electric street railways. The system was invented by Joseph C. Bonner, of Toledo, O., and was first tried in that city during the latter part of 1898. Heavy wagons, of three to seven tons carrying capacity, fitted with wide tires, are shifted at transfer points to special street railway trucks, the trucks being run under the wagon, the wheels of the latter extending down nearly to the ground, outside the truck wheels. One or more of these loaded trucks are hauled by a motor car, bringing in commodities from the country districts or the villages traversed by suburban lines. The wagons are hauled to the loading or transfer points by the farmers or others making use of them, and are provided for at the other end by the company owning the special trucks. The service at Toledo was not continued long, partly because there was not enough business to warrant it; but on January 1, 1899, the system was put on trial between Detroit and Pontiac, Mich., which are some 25 miles apart. Three wagons were used and two trains run each way daily. In Ireland the Bessbrook and Newry Electric Railway is used for ordinary wagons, as well as motor cars, the wagons being brought to and taken from the line by horses and being attached to the cars while in transit on the railway. The line is 3 miles long, rises 180 feet, and has a 3-foot gauge. The track is of steel T-rails, with a lower line of steel rails just outside the T-rails, on which the wagon wheels run. The road cost about \$78,000. It has been operated for 16 years, and is mentioned in conjunction with the Toledo and Detroit experiments to show another method of attaining the same general end.

An automatic block system for single-track electric railways, using turnouts for cars going in opposite directions, was put in operation late in 1898 by the Lowell (Mass.) Suburban Electric Railway. Each car as it advances into a block (the length of track between turnouts) cuts off the current from a section of the trolley wire on the turnouts at each end of that block, so no other car can enter until that

one leaves the block. When the car leaves one block it restores the current to its turnouts and cuts out the current from the next set of turnouts.

Of the notable accidents caused by electric cars running away since the introduction of electric traction, the following may be mentioned. Where fatalities resulted the deaths ranged from 1 to 18, the latter number being killed at Cohoes, N. Y., on September 5, 1898. The greatest number of persons recorded in the list as injured was 66, at Lawrence, Mass., on August 11, 1892, there being a couple of deaths in addition. The number of injuries in the Cohoes accident was 12. The worst electric railway accident in 1899 was near Bridgeport, Conn., on August 6, when 29 persons were killed and a dozen or more seriously injured by a car leaving the rails as it was going onto a trestle, running some 80 feet on the ties and plunging down, striking bottom side up, the heavy motors crashing through the floor and adding to the death and injury. As the car ran 80 feet on ties, proper guard rails would doubtless have prevented the accident. The car, it is said, was running at a high rate of speed down a 3 per cent. grade just before it reached the trestle. Other accidents in 1899 showed the need of the more extensive use of power brakes, instead of relying on hand brakes alone. Progress in this line until quite recently has been very slow, owing to the newness of the field and the expense involved. Even now it costs from \$150 to \$200 to equip a single car with power brakes, but the yearly capital and operating charges on equipments at this rate are insignificant compared with the damages to life and property caused by a single bad accident. Air or electric brakes are being introduced in this country, but only a beginning has been made compared with the progress abroad, where the municipal authorities are generally quite rigid in their requirements regarding safety devices.

A feature of German practice that may be mentioned is the use of the overhead trolleys in the suburbs and storage batteries in the densely populated districts, the batteries being carried as dead weights in the suburbs and charged from the lines before leaving the overhead system. Thus far the only important line employing storage batteries in this country is the Chicago Electric Transit Company, which for about two years has operated storage-battery cars over some 25 miles of track.

What will be the largest electric railway power station in the world is now being built by the Third Avenue Railroad Company at Two Hundred and Sixteenth Street and Ninth Avenue, New York. There will be 16 Westinghouse vertical, cross-compound condensing engines, with generators mounted on the shaft between the cylinders. Each engine will be of about 4500 horse-power normal capacity, making a total of 72,000 horse-power, which can be raised to a maximum of 100,000 horse-power or more. There will be 60 Babcock and Wilcox water-tube boilers, adapted for 200 pounds pressure, placed in two tiers. All the coal will be handled by machinery from the boats to the furnaces, and the ashes will be handled in like manner. The chimneys or smoke-stacks will have a total height of 200 feet above the lower boiler-room floor. There will be 4 stacks of brick for the first 102 feet, then of riveted steel courses for 98 feet, the steel portion being self-supporting, 12¾ feet in diameter, lined with brick. The chimney draughts will be supplemented by 8 large exhaust fans. There will be as many electric generators as engines (16), since they are of the direct-connected type. The current will be distributed to the lines from five or more transformer sub-stations. This big station extends from Two Hundred and Sixteenth to Two Hundred and Eighteenth Street and from Kingsbridge Road to the Harlem River dock, its outside dimensions being 246 x 325 feet. About 15,000 piles, 40 feet long, 2½ feet centre to centre, were driven for the foundation, around and above which will be 7 to 8 feet of concrete. Dr. Louis Duncan is chief engineer of the Third Avenue Railroad Company. Of scarcely less interest than the 72,000 horse-power (normal) power station of the Third Avenue lines is the station of the Metropolitan Street Railway Company, also of New York, with a normal capacity of 45,000 horse-power and a possible maximum of 75,000 horse-power for short periods. It will contain 87 Babcock and Wilcox boilers, arranged in three tiers and having an aggregate maximum capacity of 69,400 horse-power; 11 Allis engines, with an economic horse-power of 4000 each, direct connected to three-phase generators, furnishing currents of 6000 volts. The power house is 201 x 279 feet, occupying the block bounded by First Avenue, the East River, Ninety-fifth and Ninety-sixth Streets. This station, like the Third Avenue, has a pile and concrete foundation, the concrete being 5 feet deep. One of the largest brick chimneys ever built will serve the station. It has a total height of 353 feet, and rests on a solid block of concrete 85½ x 88 feet in area and 20 feet deep. The first 15 feet of the chimney in height is pyramidal in plan, with the corners cut off, diminishing from 55 feet square to 40 feet. In the next 65 feet, or at a point 80 feet high, it diminishes to a square of about 39 feet, where it begins to change to a circular section, attaining such a section at the 95-foot point. It continues circular in section to the top, tapering ⅝ inch per foot of height, until at 317 feet above the ground it is 26 feet in outside diameter. Here the ornamental

top begins, extending on to the full height of 353 feet. Mr. M. G. Starrett is chief engineer of the Metropolitan Street Railway Company.

A struggle for municipal ownership of the street railways of Detroit attracted great attention throughout the country in 1899. The movement was defeated by a court decision to the effect that the constitutional prohibition of the use of State funds for internal improvements in Michigan made it illegal for a city to construct street railways, since the legislature could not authorize a city to do what the State itself was not allowed to do. After this decision a plan was set on foot to have the street railways acquired by a company organized in the interests of the city, but this was finally dropped. A commission appointed by the city estimated the value of the unexpired portions of the various street railway franchises at an aggregate of \$8,000,000, or about the same as the value of the physical plant. An article by Mr. Edward E. Higgins, published in the *Street Railway Journal* for October, 1899, entitled *Financial Characteristics of the Large City Transportation Systems of the World*, presents statistics for 30 cities and centres of population of 500,000 or more, including all but eight of such centres in the world. The table includes the mileage of track, passengers carried, car miles run, capitalization, gross receipts, and operating profits, most of these several heads being subdivided. The figures presented are ably discussed by the author. See ELECTRIC LIGHT AND POWER; RAPID TRANSIT.

ELECTROLYSIS. See WATER-WORKS.

ELECTRO-THERAPEUTIC ASSOCIATION, AMERICAN, held its ninth annual meeting in Washington, D. C., September 19-21, 1899, under the presidency of Dr. F. B. Bishop, of Washington. Officers elected: President, Francis B. Bishop, M.D., Washington, D. C.; secretary, John Gerin, M.D., Auburn, N. Y.

ELEMENT. See CHEMISTRY.

ELEVATED RAILWAYS. See RAPID TRANSIT (paragraph Elevated Railway).

ELEVATORS. The modern steel skeleton tall building of America owes its possibility very largely to the development of the high-speed passenger elevator. Without this means of transportation the upper floors of such buildings would be practically useless. In some of the great New York and Chicago tall buildings the number of passengers carried each day by elevators numbers into the tens of thousands. To carry this traffic rapidly, safely, and cheaply, plainly requires an exercise of mechanical ingenuity in the elevator design and construction which is of no mean proportions. American elevator practice excels that of any other country, and some of the most notable elevator installations in foreign countries have been made by American manufacturers of this apparatus. See TALL BUILDINGS.

The modern high-speed passenger elevator is usually operated by hydraulic or electric power, and it consists (1) of a rectangular car which moves up and down between guides in a shaft or well having door openings into each floor, and (2) of the mechanism necessary to give this car its up and down movement. Such elevators are usually designed to run at a maximum speed of 600 feet per minute, but may be run at any less speed the operator may desire. Safety from accident is provided for in various ways. Broadly considered, modern elevator safety devices may be divided into two classes: (1) Clutch devices, which are thrown into operation when the car exceeds a certain speed, and stop the car by seizing hold of or gripping guides fastened to the walls of the elevator shaft, and (2) air-cushion devices, whose purpose is to break the shock of a falling car so that injury will not result to its passengers. Elevator safety grips are of various forms, and the successful ones are nearly all owned or employed by the firms which build elevators. The general principle upon which these devices operate is nearly the same, whatever their individual forms may be. A governor is placed on the elevator car whose speed varies with the speed of the car. When a certain speed is exceeded this governor actuates a mechanism which throws the clutch into operation. The older and most commonly used form of air-cushion consists essentially of making the lower portion of the elevator shaft tight so that the car falling into it acts as a piston in a cylinder, and is brought to a slow stop by the compression of the confined air. In one of the largest installations of this form of air-cushion, the closed shaft begins at the third story and is 50 feet deep. The total travel of the car is 287 feet, which makes the ratio of the depth of the air-cushion to the distance of travel as 1 to 5.74. In a display test, which was made with the cushions, a car weighing 2000 pounds was allowed to drop the total 287 feet, and it came to a complete stop without breaking eggs and incandescent electric lamp bulbs, which were placed on the floor of the car. A more recent form of air-cushion, which was first brought prominently to public attention in 1899, has the air-cushion at the top of the shaft. In this arrangement the car carries two grips, the jaws of which in normal operation encircle but slide loose over two steel cables provided with buttons. These cables are attached

at their tops to a yoke, which is carried by a piston rod and piston working in a vertical steel cylinder placed on the roof of the shaft. Normally the piston is held at the top of the cylinder by a spring-latch. When the car falls the governor first operates a clutch which opens the latch, and secondly, it operates the grips which close on the button ropes. This throws the weight of the car into the yoke and piston, which, sliding down in the cylinder, compresses the contained air, and brings the car to a gradual stop. As indicating the nature and size of some of the elevator installations in tall buildings, the following figures are of interest: Monadnock Block, Chicago, 16 hydraulic elevators, all of 16-stories travel; St. Paul Building, New York, 6 hydraulic elevators, two 25-stories travel, two 16-stories travel, two 9-stories travel; Bowling Green Building, New York, 9 hydraulic elevators, 16-stories travel; Ivins Syndicate Building, New York, 15 electric elevators, five 25-stories travel, and five 26-stories travel, one freight 26-stories travel, and two tower and two sidewalk elevators. The St. Paul Building elevator plant is a good example of express elevator service. Two of the elevators in this building travel to the ninth floor, stopping at every floor; two travel to the sixteenth floor, stopping at every floor above the ninth, but passing "express," or without stopping at floors one to nine; two travel to the twenty-fifth floor, running "express" to the sixteenth floor and "local" above that floor. An elevator plant of from four to six elevators requires a boiler-power of from 500 to 600 horse-power to operate them, and will cost to install from \$25,000 to \$40,000. For grain elevators see that title.

ELGAR, EDWARD, English composer, who attracted attention in 1899, was born in Broadheath, Worcestershire. He was educated privately, studied the violin and organ, became organist of St. George's Church, Worcester, and subsequently settled in Malvern. His compositions include: *The Black Knight*, cantata, 1892; *From the Bavarian Highlands*, a choral suite, Worcester Festival, 1896; *King Olaf*, 1896; *Imperial March*, 1897; *Banner of St. George*, 1897; *Te Deum*, Hartford Festival; and *Caractacus*, Leeds Festival, 1898. His works produced in 1899 were excellent: A symphony entitled *Gordon*, inspired by the career of General Gordon, was written for the Worcester Festival; *Sea Pictures*, for the Norwich Festival; and his *Symphonic Variations* were heard under Dr. Richter's bâton in London.

ELLERBE, WILLIAM HAZELDEN, governor of South Carolina, died of consumption at his home in Marion County, June 2, 1899, after an illness of four months. He was born in Marion County, S. C., April 7, 1862. After studying at Pine Hill Academy he entered Wofford College, Spartanburg, in 1880; here he remained until 1882, when he went to Vanderbilt University, Nashville. He was soon obliged however, to relinquish his studies on account of ill health. He became a farmer, but entered politics, and in 1890 was elected comptroller-general on the ticket headed by the present United States Senator, Benjamin R. Tillman. In 1896 Mr. Ellerbe effected a union of the opponents and the more moderate followers of Mr. Tillman; and he himself, as a representative of conciliation, was nominated for governor and was elected by a large majority. The very fact that he was elected by combining factions made his position difficult, and during his term he made many enemies; his opponents, therefore, were for the most part united in the campaign of 1898, giving their support to the Prohibition candidate. Mr. Ellerbe was re-elected, however, but by a small majority. The week of the November election of 1898 was marked in some parts of the State by violent anti-negro demonstrations; Governor Ellerbe was condemned by many for tardiness in exercising executive authority for the quelling of the riots.

ELLIS, THOMAS EDWARD, Liberal member of Parliament, for Merionethshire, died April 5, 1899. He was born in Wales in February, 1859; was educated at the University College of Wales and at New College, Oxford. Mr. Ellis took an active part in educational and other public questions of Wales. He entered Parliament in 1896, and in 1895 was made chief whip of the Liberal opposition. He published *Public Education in Cheshire* and was joint-author of *A Hand-book of Intermediate and Technical Education for Wales*.

Ritualistic Controversy.—The controversy between the high church Romanizing element in the Church of England and the low church, which began in 1898, was continued in 1899, the Archbishop of York's letter of December, 1898, regulating various ritualistic observances. In January, 1899, a meeting of high church clergy took place, and in the same month a mass meeting was held in London to protest against the Romanizing of the Anglican Church. In February the English Church Union met and protested against the interference of Parliament in matters of religious doctrine and ceremonial. An inquiry was held before the Archbishops of Canterbury and York in May into the rights of clergymen to use incense and processional lights, and it was found by the archbishops that the Book of Common Prayer and the canons of the church gave no authority for the use of either processional lights or incense during services, though it did not prescribe against the burning of incense before services to sweeten the church. This decision, though most unwelcome to the high church element, was accepted by clergymen generally. The subject of confession was taken up by press and Parliament, and in the latter resolutions were passed deploring the lawlessness shown by certain clergymen, and recommending that, if the bishops could not succeed in making the clergy conform to the canons in the matter of church ritual, further legislative enactments were to be considered necessary.

ENTOMOLOGY. The year 1899 was not productive of any extraordinary discovery or any unusually notable piece of work in the field of entomology. The systematic entomologists have been very active, as in preceding years, and about 3000 new species of insects have been described, about three-quarters of the number described in 1898. As might be expected, the butterflies and moths and the beetles

contribute the bulk of the new species. Perhaps the most interesting and important investigations carried on in entomology during the year have been those dealing with the relation of mosquitoes and malaria. These have been carried on in Italy, Africa, and India, under the auspices of the Royal Society, and with the assistance of the British government. Although the investigations are undertaken from the medical point of view, and come under that head more properly, they have an important entomological bearing. So far the investigations have not shown conclusively that malaria in man is wholly due to mosquitoes. Several methods for the destruction of mosquitoes have been tried in India. Draining marshy areas has proved successful, and throwing kerosene on the water has also been effective, but the most satisfactory results are promised by the use of permanganate of potash, a chemical also effective against the cholera bacillus. See MALARIAL FEVER AND MOSQUITOES.

In the United States, economic entomology is each year occupying a more important position, and the Society of Economic Entomologists is now one of our important scientific societies. The eleventh annual meeting was held at Columbus, O., August 18, 1899, just preceding the meetings of the American Association for the Advancement of Science. The address of the retiring president, Mr. C. L. Marlatt, was on *The Laïsssez-faire Philosophy Applied to the Insect Problem*. The position was taken that the introduction of new forms are world movements, not to be thwarted by man, and that the only legitimate field for efforts in applied entomology is the local control of injurious species. Mr. Marlatt regards the efforts to exterminate foreign insects once established as futile. In spite of this address, however, resolutions were adopted endorsing the work of the Massachusetts Gypsy Moth Commission and the quarantine work of the California State Board of Horticulture. Some two dozen papers were presented by a dozen different workers. The annual meeting of the Entomological Society of London was held on January 18, 1899, and the address by the president, Roland Trimen, F.R.S., was on *Seasonal Dimorphism in Lepidoptera*. The literature of this remarkable phenomenon was thoroughly reviewed, and numerous observations of the speaker and his correspondents were recorded, but no theoretical conclusions were drawn, as the body of facts is at present too small to warrant any far-reaching deductions. Some very interesting facts were stated, showing that certain butterflies, which had been described as distinct species, were in reality only varieties due to the season of the year when captured. Another very important address relating to insects was delivered the same evening, January 18, in Washington. It was the address of the retiring president of the Biological Society, Mr. L. O. Howard, and the title was *The Economic Status of Insects as a Class*. The injurious and beneficent work of insects is dealt with in detail, but the author leaves us in doubt as to whether the sum total of one overbalances the other or not. He finds that insects are injurious in five ways: As destroyers of valuable plants; as destroyers of stored food, clothing, dwellings, books, etc.; injuring useful animals; annoying man, and carrying disease. There are six ways in which insects are a benefit: As destroyers of injurious insects; as destroyers of noxious plants; as pollenizers of plants; as scavengers; as makers of soil, and as food (for man and beast), clothing, and use in the arts. Each of these classes is enlarged upon and dealt with in some detail, the whole making a very readable address.

The work of the Massachusetts Gypsy Moth Commission has been continued along the lines planned last year. The legislature appropriated \$200,000 for the work of the commission, of which it was intended \$10,000 should be used in attempting to kill off the brown-tail moth, which has become a pest in some parts of the district already infested with the gypsy moth. The State has now expended about a million dollars, and in the towns where the gypsy moth first began its destructiveness, it is still a serious nuisance. This fact has caused considerable criticism of the commission and its methods of work, and there was strong opposition to appropriating any more money for what seems such an endless task. But the legislature finally took the advice of those best qualified to judge, and granted the appropriation as requested.

Literature.—The year 1899 has seen a large amount of entomological literature published, though the bulk of it has been technical, and deals largely with the systematic side of the subject. The most important book which has appeared is doubtless Vol. VI. of the *Cambridge Natural History*, entitled *Insects, Part II.*, by Dr. David Sharp. The volume treats of the great bulk of the true insects, all the large and most interesting groups receiving attractive and thoroughly scientific treatment. While the illustrations are not above criticism, the text seems to have called forth only favorable comment, which is the more remarkable when we consider the immense amount of material that is condensed within these 600 pages. Naturally much attention is given to the habits of the ants and bees, especially the former, and the latest observations are made use of to bring this part of the subject

right up to date. Indeed, it may be truthfully said that few, if any, natural histories of insects have ever included so much of the results of recent research work. Several popular books on insects have appeared, chiefly referring to the butterflies and moths. One of the best of these is *Everyday Butterflies*, by the well-known entomologist, Dr. S. H. Scudder. It is not nearly so elaborate a work as Dr. Holland's *Butterfly Book*, which appeared last year, but it contains nearly 400 pages, and is fully illustrated with text figures, and nine plates, eight of which are colored. It treats of the life, history, habits, and distribution of 62 of our commoner Eastern butterflies, in a style combining literary grace with the most scientific accuracy. It will prove an admirable book for those who are beginners in the study of our *Lepidoptera*. Another work dealing with these insects is Vol. V. of Mr. Charles G. Barrett's *Lepidoptera of the British Islands*, which appeared in the early spring. This volume contains 381 pages, and is issued in two editions, one with, the other without plates. It deals with the Noctuæ only, and of these 111 species are treated. A more popular work dealing with another group of insects, is *True Tales of the Insects*, by L. N. Badenoch. It is a volume of 250 pages, with 44 excellent illustrations. The more interesting families of the *Orthoptera* are described, their habits, transformations, and senses being handled in a way that is both entertaining and instructive. In addition there are chapters on butterflies and various species of moths. On the whole, the author has made a useful and attractive book. See ZOOLOGICAL LITERATURE (paragraph Popular Books).

EPILEPTIC COLONIES. A bill for the establishment of an epileptic colony in Illinois passed both houses of the legislature of that State in November, 1899. An appropriation of \$25,000 is to be made by the State for necessary preliminary expenses, under the supervision of the State commissioners of public charity. An appropriation has been asked from the legislature for the purchase of 1000 acres of land for the colony. It was estimated, in a report to the State commissioners in 1894, that there were 8000 epileptics in the State. The number is believed to be smaller now. Several States have institutions for feeble-minded and epileptic patients, or for defective or degenerate children from any cause; but there are only five that have established institutions exclusively for the epileptic. These are Massachusetts, New York, New Jersey, Texas, and Ohio. The last named has a large hospital for epileptics at Gallipolis; the others have colonies. The largest and best equipped of the colonies is that of New York State, at Sonyea, near Mt. Morris, in the Genesee Valley. This is called Craig Colony. The tract includes over 1000 acres of well-watered, fertile land, largely under cultivation. It was purchased from a dwindling Shaker colony in 1894, with buildings and roads, railway facilities and other improvements. Craig Colony was opened for patients in January, 1896. The present capacity of the institution is for 360 patients. No children under 7 years are admitted at present. Over 700 applications are now on file. When a group of buildings, now in process of erection, is completed the number accommodated will reach 620 patients. On January 27, 1899, at the end of the third fiscal year, the colony contained 353 patients, 163 males and 190 females. Of the females 33 were under 16 years of age, and of the males 20 were under 16 years of age. There were 6 males and 9 females in the hospital at this date. Between January 27, 1896, and January 27, 1899, 455 cases were received, 232 males and 223 females. During this period 102 were discharged, as follows: Recovered, 7; improved, 40; unimproved, 17; insane, 12; died, 26. Four of the twelve insane patients were insane when admitted. They were all transferred to the State hospitals. The value of the products of the farm and of the various departments of the colony reaches \$36,889 annually.

The Massachusetts colony for epileptics is at Monson, and includes 237 acres, about one-half of which is tillable. It was opened May 2, 1898, and contains 200 inmates, the sexes being about equally divided. The New Jersey colony is at Skillman, Somerset County, and includes 187 acres. The property was purchased in the autumn of 1898, and an appropriation has been made by the legislature of 1899 for the erection of cottages and for the purchase of additional land. The establishment is not yet opened for the reception of patients. The Texas colony was established under an act passed in 1899, appropriating \$50,000 for the purpose. It will be situated at Abilene, where a site of 640 acres has been donated by that city. There is in Pennsylvania a private corporation known as the Pennsylvania Epileptic Hospital and Colony Farm. This establishment was started February 3, 1898, at Oakbourne, on a farm of 110 acres. On the 4th of March, 1899, there were in the two cottages 30 patients, 12 men and 18 women.

At Chalfont St. Peter, England, a farm of 135 acres was purchased in 1893 by the National Society for the Employment of Epileptics, and the first building in the colony was opened for patients in August, 1894. At present there are six houses, with accommodations for 66 men, 24 boys, 24 women, and 24 girls, besides a hospital with ten beds. Patients enter the colony voluntarily, without commitment.

The colony of Bethel, near Bielefeld, Germany, established in 1867, has, under the

celebrated Pastor von Bodelschwingh, had a marvellous development. On the 1st of July, 1898, the settlement contained with its officers, physicians, nurses, and employees about 3500 persons. There are eleven medical men and six pastors in attendance. There were 1516 epileptics in the colony on July 1, 1898. During 1897, 1691 were cared for, about equally divided in number between the sexes. During the year 250 patients were received and 199 were discharged. The entire number received up to January 1, 1899, was 5028. Of these 388, or 7.7 per cent., were cured; 1099, or 21.2 per cent., were discharged improved; 1058, or 21 per cent., as not cured, and 991, or 19.7 per cent., died. About 61 per cent. of those discharged as cured were under 18 years of age. Only 47 have been turned over to insane asylums. On the 1st of January, 1898, there were but 13 male and 12 female patients in the "cell houses" of closed departments for cases of mental derangement.

EPISCOPAL CHURCH. See PROTESTANT EPISCOPAL CHURCH.

EPWORTH LEAGUE, a religious society of the Methodist Episcopal Church, in the United States, was organized in 1889. In 1899 it had 26,700 chapters and 1,900,000 members. The organ of the Epworth League is the *Epworth Herald* (weekly). President, Bishop William X. Ninde; secretary, Rev. Edwin A. Schell, 57 Washington Street, Chicago, Ill.

EPWORTH LEAGUE OF THE M. E. CHURCH, SOUTH, organized in 1891, had 5031 chapters in 1899, and 271,445 members. The League publishes the *Epworth Era*. President, Bishop F. A. Candler; secretary, Rev. H. M. Du Bose, Nashville, Tenn.

ERCKMANN, ÉMILE, joint author with Alexandre Chatrian, died at Lunéville, France, March 14, 1899. He was the son of a bookseller, and was born May 20, 1822, at Phalsbourg, Meurthe, then French territory, but now belonging to Germany. His education was irregular, and in 1842 he began a law course in Paris, which he pursued with various interruptions until 1858, when he abandoned it definitely for literature. In 1847 he had met Chatrian, and began with him the literary collaboration that continued almost to the time of the latter's death in 1890. It was not until 1863 that it became known that their books, written under the name of Erckmann-Chatrian, were not the work of a single person. Their first real success came with the publication of *L'illustre Docteur Mathéus* in 1859. From this time their popularity never left them. Their works reveal no small degree of versatility, depicting, among various other scenes, picturesque and faithful studies of German life and of the days of the Revolution and the empire in France. Many of their stories have been translated and are now familiar to English readers; especially well known is the drama *Le juif polonais*, which is in the repertory of Sir Henry Irving as *The Bells*. Their writings include: *Le sacrifice d'Abraham* and *Le bourgmestre en bouteille*, their first efforts; *Les chasseurs des reines* and *L'Alsace en 1814*, dramas; the romance, *L'illustre Docteur Mathéus*, 1859; the following romances and tales: *Contes fantastiques*, 1860; *Maitre Daniel Rock*, 1861; *Contes des bords du Rhin*, 1862; *L'invasion ou le fou Yégof*, 1862; *Le joueur de clarinette*, 1863; *La taverne du jambon de Mayence*, 1863; *Madame Thérèse*, 1864; *L'ami Fritz*, 1864; *L'histoire d'un conscrit de 1813*, 1864; a sequel of the three last named books, *Waterloo*, 1865; *Histoire d'un homme du peuple*, 1865; *La maison forestière*, 1866; *La guerre*, 1866; *Le blocus*, 1867; *Histoire d'un paysan*, 1868-70; *Histoire d'un sous-maitre*, 1869; *L'histoire d'un plébiscite*, racontée par un des 7,500,000 Oui, 1872; *Le brigadier Frédéric*, 1874; *Maitre Gaspard Fix*, 1876; *Souvenirs d'un chef de chantier à l'isthme de Suez*, 1876; *Contes vosgiens*, 1877; *Le grand-père Lebigre*, 1880; *Les Rantzau*, 1882; *Masséna et Souvarof*, 1885. Subsequent to Chatrian's death in 1890 Erckmann published *Kaleb et Khora* and *La première campagne du grand-père Jacques*.

ERITREA, or ERYTHREA, is a possession of Italy on the western coast of the Red Sea, along which it lies as a narrow strip of country some 670 miles in length. The British-Egyptian Soudan bounds it on the north, and French Somaliland on the south, while on the west it is confined by Abyssinia. Eritrea has an area estimated at about 88,500 square miles, and a population, largely nomadic, estimated at 450,000. The government is under a civil governor, nominated by the king, and placed under the direction of the Italian minister of foreign affairs. Farming is pastoral rather than agricultural, the products being chiefly meat, hides, butter, and other supplies sustained by sheep, cattle, and goat herds. The principal town and the seat of government is Massowah, on the Red Sea. It has a population of 7775, including about 600 Europeans, not counting the garrison. At Massowah, and also at the Dahlak Peninsula, there are pearl fisheries of considerable importance. The trade of Massowah consists almost entirely of goods in transit, those coming from the interior of Africa being exported to India, Europe, or the Red Sea ports, and those imported into Massowah by sea being destined for the interior. The latest figures available are for 1896, when the imports at Massowah showed a value of

\$3,342,750, an increase within the year of \$1,496,351, or 45 per cent. Massowah is connected by a military railway, 17 miles in length, with Saate, and by short lines aggregating 16 miles with other points. It is also connected by telegraph with Perim, via Assab, a distance of 380 miles. Eritrea has undergone several changes of territory since it passed from the control of Egypt to that of Italy in 1886. During 1889-91 Italy secured Hameson and the northern districts, and some coast-line from Abyssinia. In 1894 Kassala was captured from the Dervishes. Kassala was recaptured by the Egyptians in 1897, and in 1896 Abyssinia forced Italy to restore the greater part of the districts which had been taken by her, and to recognize the complete independence of Abyssinia. In fixing the boundary line between Eritrea and Abyssinia, in 1897, Italy was in addition shut out of two important provinces which had been claimed by her. A commercial treaty was, however, arranged between the two countries, by which the facilities for commercial relations between Abyssinia and the Italian possessions were to be promoted. In this treaty Italy secured a representative in the Abyssinian court, and full freedom of trade and travel for her citizens in Abyssinia. She also secured protection for her merchants, and the application to herself of the most-favored-nation clause.

ERMENTROUT, DANIEL, Democratic member of Congress from Pennsylvania, died at his home in Reading, September 17, 1899. He was born in Reading, January 24, 1837, and was educated in the public schools of that city and at Franklin and Marshall College, and at the Elmwood Institute at Norristown, Penn. He studied law, and in 1859 was admitted to the bar. In 1862 he was elected district attorney of Berks County, and held the position for three years; from 1867 to 1870 he was solicitor for the city of Reading. He was elected to the State Senate in 1873, and in 1876 was returned for the ensuing term. In 1880 Ermentrout was elected to Congress to represent Berks County, which at that time constituted the eighth congressional district; he was re-elected for the Forty-eighth, Forty-ninth, and Fiftieth Congresses, serving continuously until 1889. Berks and Lehigh Counties now constitute the ninth district, and this in 1896 he was elected to represent in the Fifty-fifth Congress; in 1898 he was re-elected for the next Congress. For many years Ermentrout was a member of the Reading Board of School Control.

ESHER, First Viscount, WILLIAM BALIOL BRETT, K.B., was born August 13, 1815; died May 24, 1899. He was educated at Westminster and at Caius College, Cambridge, receiving his M.A. degree in 1840. He studied law and was admitted to practice, Lincoln's Inn, in 1846; in 1860 he became a Queen's counsel, and was solicitor-general in 1868. From 1866 to 1868 he sat in Parliament as a Conservative for Helston. In the latter year he was also made justice of common pleas; he served thereafter on the English bench for thirty years. In 1875 he became a judge of the High Court of Justice, and in the next year lord justice of the Court of Appeal. He was made a K.B. in 1868, from 1883 to 1899 was master of the rolls, and was raised to the peerage in 1897. His son, Reginald Baliol Brett, succeeds to the title.

ESTERHAZY, MARIE CHARLES FERDINAND WALSHIN. See FRANCE (paragraphs on History).

ETHICAL CULTURE, SOCIETY FOR, organized in 1876 by Dr. Felix Adler, had in 1899 a membership of 880. It conducts a secondary school at 109 West Fifty-fourth Street, New York. There are ethical culture societies in Philadelphia, Chicago, St. Louis, and in various cities in Germany, Switzerland, Austria, and Italy. There will be an international congress of the Society for Ethical Culture in London in 1900. The society publishes the *Ethical Record*. President, John D. Lange; secretary, Robert D. Kohn, 669 Madison Avenue, New York City.

EUSTIS, JAMES BIDDLE, LL.D., former United States ambassador to France, died at Newport, R. I., September 9, 1899. He was descended from an old Creole family of Louisiana, and his father, George Eustis, was at one time chief justice of that State. He was born in New Orleans, August 27, 1834; was educated in the public schools of Brookline, Mass., and in 1853-54 attended the Harvard Law School, where he received the degree LL.B. Having entered his father's law office, he was admitted to practice in New Orleans in 1856. At the outbreak of the Civil War he entered the Confederate service as judge-advocate on the staff of General Magruder, and in 1862 was transferred to the staff of General Joseph E. Johnston, with whom he remained until the close of the war. He resumed his legal practice, and having entered politics served in the lower house of the Louisiana legislature in 1872, and in the Senate from 1874 to 1878. It was during this time that he was chairman of a legislative committee that unsuccessfully attempted to arrange with the authorities at Washington for a more satisfactory method of the reconstruction of Louisiana. In 1876 Eustis was elected as a Democrat to the United States Senate, but in 1879 he resigned and accepted the chair of civil law in the University of Louisiana; this he retained until elected again to the Senate for the term from 1885 to 1891. In

this second term he displayed opposition to many of the official acts of President Cleveland. He subsequently, however, seemed to arrive at an understanding with the President, for at the beginning of the latter's second term he was appointed the first United States ambassador to France. He served in this capacity from 1893 to 1897. This appointment received general approval. Earlier in his life Eustis had lived for a time in Paris, and by his knowledge of French and his professional attainments, together with his force of character, he performed the duties of ambassador with dignity and ability. He translated into English Guizot's *Histoire générale de la Civilisation en Europe*.

EVANGELICAL ASSOCIATION, sometimes incorrectly called the German Methodist Church, founded 1800, reports an unprecedented financial success during the year 1899. The Missionary Society reported total receipts for the year to the amount of \$199,673, making a total receipt of \$879,757. The missionary debt was liquidated. The general conference met in quadrennial session at St. Paul, Minn., in October. In 1899 this denomination had 1031 ministers, 1819 churches, and 117,613 communicants. This body and the United Evangelical Church (*q. v.*) has, according to the latest report of the Commissioner of Education, published 1899, 3 institutions of learning, with 19 professors, 177 students, and endowment funds of \$24,000.

EVOLUTION. See BIOLOGY; ZOOLOGICAL LITERATURE (paragraph General Treatises).

EXMOUTH, Fourth Viscount, EDWARD FLEETWOOD JOHN PELLEW, died November 1, 1899. He was the son of the Hon. Fleetwood John Pellew, son of the third viscount. His great-grandfather, the first peer, was the famous Admiral Pellew who captured the French frigate *Cleopatra* in 1814, and who received his title in 1816 for his gallantry in bombarding and destroying the fleet and arsenal of Algiers. Lord Exmouth was born in 1861; he was a captain of the Fifth Volunteer Battalion of the Devonshire Regiment. His son, the Hon. Edward Pellew, succeeds him.

FABIAN SOCIETY, founded in England in 1883, has for its object the furtherance of socialism. Had in Great Britain in 1899 a membership of 861, including about 150 lecturers. There are branch societies in English universities and in various parts of the United States. The publications of the society include *Fabian Essays in Socialism* and *Fabian Tracts*. Secretary, E. R. Pease, 276 Strand, W. C., London, England.

FAIRBAIRN, ANDREW MARTIN, M.A., D.D., LL.D., principal of Mansfield College, Oxford, extended in 1899 his list of religious publications with *Catholicism, Roman and Anglican*, and *The Person of Christ and the Philosophy of Religion*. He was born November 4, 1838; entered the ministry; was principal of Airedale College, Bradford, 1877-86; principal of Mansfield College from its foundation in 1886. He was the Lyman Beecher lecturer at Yale in 1891-92, the Morse lecturer at Union Theological Seminary, New York, 1893, and the Haskell lecturer at the University of Chicago, 1898-99. The subject of the Haskell lectures was *Comparative Religion in India*.

FAIRBAIRN, ROBERT BRINKERHOFF, D.D., Protestant Episcopal clergyman and educator, died in Brooklyn, N. Y., January 27, 1899. He was born in New York City in 1818; was educated at Trinity College, Hartford, and the General Theological Seminary, New York. In 1843 he was ordained deacon, and became rector of Christ Church, Troy. His next charge was St. John's Church, Stillwater, N. Y. In 1853 he assumed the principalship of Catskill Academy and ten years later became professor of mathematics in St. Stephen's College, Annandale, N. Y. Subsequently he was made warden of the college; he retired several months before the time of his death. Dr. Fairbairn had been a vice-president of the American Meteorological Society, an honorary fellow of the Society of Science, Letters, and Art, of London, and an associate of the Victoria Institute of Great Britain. Among his publications may be mentioned *The Child of Faith*; *College Sermons*; *Of the Doctrine of Morality*; and *The Unity of Faith*, 1895.

FAITH CURE. See SUGGESTION.

FAULKLAND ISLANDS, a crown colony of Great Britain, lie about 300 miles east of the Straits of Magellan, between about 51° and 53° south latitude and 57° and 62° west longitude. They comprise upward of 100 small islands, of which

East Falkland has an area of 3000 square miles and West Falkland 2300 square miles, the total area being 6500 square miles. According to the census of 1891, the population was 1789; in 1896 the number had increased to 1992 and in 1897 to 2050. The chief town and seat of government, Stanley, on the coast of East Falkland, has about 694 inhabitants. There are three churches—an Anglican, a Roman Catholic, and a Baptist. Education is provided for by two government schools, one Roman Catholic school, one Baptist, and the Darwin school, the aggregate number of pupils in 1897 being 231.

The administration of the colony is vested in a governor, assisted by an executive and a legislative council, all of whom are appointed by the crown. The governor and chief justice since 1897 has been William Grey-Wilson, C.M.G., formerly governor of St. Helena. The statistics of finance and commerce are as follows:

	1895.	1896.	1897.	1898.
Revenue.....	£12,518	£12,358	£12,970	£13,039
Expenditure.....	13,159	13,569	13,636	14,278
Imports.....	71,826	69,985	63,286	72,987
Exports.....	122,988	132,194	125,123	106,984

The principal items of revenue are customs and the rents of crown lands, and of expenditure, mails and public works. The chief industry is sheep-raising, there being about 732,000 sheep and 2,325,000 acres of pasturage. The exports are principally wool, hides, skins, and tallow, and the imports provisions, apparel, iron goods, machinery, and building materials; the foreign trade is almost entirely with Great Britain. In 1898 the wool export amounted to £92,206. The shipping entrances in 1897 were 42 vessels of 54,144 tons; the combined entrances and clearances for 1898 aggregated 124,147 tons. About 15,000 letters and post-cards and 14,400 pounds of newspapers pass through the post-office yearly. South Georgia, a barren and uninhabited island with an area of 1000 square miles, lying some 1000 miles east-southeast of the Falkland group, and several other small islands, are included in the colony.

FALLIÈRES, CLÉMENT ARMAND, French statesman, was elected president of the senate on March 3, 1899, to fill the vacancy caused by the election of M. Émile Loubet to the presidency of the republic. M. Fallières is regarded as a politician, neither brilliant nor ambitious, but diligent and conscientious, and he is said to have the confidence of all parties. He is a Positive Republican, but for the time being favors an opportunist policy. He has held the following cabinet positions: Minister of the interior, 1880 and 1882; minister of foreign affairs, 1883, and in the same year minister of public instruction; minister of justice, 1887, and minister of the interior, 1887; minister of public instruction, 1889; minister of justice, 1892.

FARMERS' ALLIANCE AND INDUSTRIAL UNION, NATIONAL, founded in Texas in 1876, has spread to other States. Its object is the betterment of the agricultural classes and the development of good citizenship. President of the National Society, J. C. Wilborn, Old Point, S. C.; secretary-treasurer, A. B. Welch, Victor, N. Y.

FARRER, First Baron, Sir THOMAS HENRY FARRER, a high authority in England on questions of trade and finance, died October 12, 1899. He was born June 24, 1819; was educated at Eton and at Balliol College, Oxford. He was admitted to the bar, and in 1850 was appointed assistant secretary in the marine department of the Board of Trade. Subsequently he became permanent secretary of the Board of Trade, resigning the position in 1886. He had been a member and vice-chairman of the London County Council. In 1883 he was created a baronet, and in 1893 was raised to the peerage for his distinguished public services. He was a Liberal in politics and was an advocate of the "open door" policy. Among his best known publications are *Free Trade vs. Fair Trade* and *Studies in Currency*, 1898.

FAUNCE, WILLIAM HERBERT PERRY, A.M., D.D., president of Brown University, was elected to his present position on June 3, 1899, to succeed Dr. E. Benjamin Andrews, who resigned in 1898. At the time of his election Dr. Faunce was pastor of the Fifth Avenue Baptist Church in New York City. He was born in Worcester, Mass., January 15, 1859; he prepared for college at Concord, N. H., and having entered Brown, was graduated there in 1880. He taught mathematics at the university during the following year and then entered the Newton Theological Institution, being graduated at the head of his class in 1884. His first charge was the State Street Baptist Church in Springfield, Mass., where he remained until 1891, when he accepted a call to the Fifth Avenue Church in New York. He has served as university preacher at Harvard, and has lectured at various educational institutions. His inauguration took place on October 17, 1899.

FAURE, FRANÇOIS FELIX, sixth president of the third French Republic, died suddenly of apoplexy at the presidential palace, Elysée, in Paris, on the evening of February 16, 1899. He had been president of France for four years, having been elected on the 17th of January, 1895, and his term of office lacked three years of expiration. President Faure, who arose from the *bourgeoisie*, was not regarded as a great statesman, but was recognized as a man of personal integrity, and of shrewdness and ability in matters of politics and finance.

Faure was born in Paris, January 30, 1841. His father was a cabinet-maker, who had become sufficiently prosperous to send Felix, when the latter was ten years old, to the Institution Bousquet, at Chaillot, and later to enable the boy to pass two years in England to receive a commercial education and to learn the language. So thoroughly did he master English that he was said to speak it without an accent. Returning to France, he served for three years as a tanner's apprentice at Amboise, and subsequently worked for some time at his trade as a journeyman. Having gained not only a detailed knowledge of the leather business, but a thorough business training, he engaged himself to a large leather firm in Havre, where he was soon taken into partnership, and afterward became the head of a commercial house that grew to be one of the most important in the city. His leather business became exceedingly large, bringing to Faure proportionate profits, which, from time to time, he invested in other commercial enterprises, including importing, shipowning, etc. He gained much popularity in Havre, where he came to be known as an authority on finance and the author of a work entitled *The Comparative Budgets of European States*. He was intimately associated with various charitable and other organizations for public improvement, and at one time delivered lectures on history at an evening school in the city. When the Franco-Prussian War broke out Faure, then in his thirtieth year, was president of the Chamber of Commerce at Havre.

During the war he served as a captain in the Garde Mobile, and for remarkable courage was rewarded with the cross of the Legion of Honor. His real political career began in 1881 when, as a Republican, he was elected to represent Havre in the chamber of deputies. In the same year, on account of his advocacy of the opportunist policy of Gambetta, the latter called him to his cabinet as under-secretary of state for commerce and the colonies. This cabinet fell in 1882, but in 1883-85 Faure held the same position in Ferry's last cabinet. In 1885 he was sent again to the chamber of deputies, and in 1888 again took charge of his old portfolio, in the cabinet of M. Tirard. Faure was returned again from Havre to the chamber of deputies in 1888, and in 1894, during the brief presidency of M. Casimir-Périer, was minister of marine in the cabinet of M. Charles Dupuy.

The resignation of President Casimir-Périer in January, 1895, was probably brought about by his realization of the insecure situation of the French political parties, which might be seen from the dissensions existing among the several groups of Republicans. It was seen that a moderate Republican was needed for the presidency—a man who not only would compel respect, but who would for a time at least insure political quiet and freedom from attempted revolution. M. Waldeck-Rousseau seemed to be favored by the moderate Republicans, but he withdrew his candidacy after the first ballot; on the second ballot the national assembly (consisting of the senate and the chamber of deputies) elected Faure by a vote of 430 against 361 for M. Henri Brisson, January 17, 1895.

It was not expected that President Faure would inaugurate any great policy, and he did not. He was a man of unflagging industry, and constantly strove to invest his office with a courtly dignity and ceremonial splendor. Indeed, such a stickler for form and ostentation was the president that he made himself almost ridiculous in the eyes of the world. If Faure had been a truly great man, the regal ceremonies would have seemed more appropriate, or, rather, it is likely they would not have taken place at all. But though worthy and able, he was not a great man; to be sure, no revolution was attempted during his administration, and it was for a check to revolution that his election was effected; but immediately before his death there were abroad ominous rumors of a Bonapartist *coup d'état*. In regard to the Dreyfus affair, it was known that to the last his sympathies were with the anti-revisionists; Dreyfus was first convicted when Faure was a cabinet minister. A prominent event of his administration, and one in which he took much pride, was the alliance between France and Russia, which followed upon Faure's visit to the Czar in August, 1897. Faure was a man neither of lofty ideals nor of far-reaching and comprehensive plans; he was commonplace; but he seems to have served France in a way that will not bring upon him any considerable amount of disapproval.

FEARN, J. WALKER, was born at Huntsville, Ala., January 13, 1832; died at Hot Springs, Va., April 8, 1899. He was graduated at Yale in 1851, and two years later was admitted to the bar in Mobile. He entered the diplomatic service in 1854 as secretary of legation in Brussels; from 1856 to 1858 he held a similar position in

Mexico. In 1861 he was one of the Confederate commissioners to the European powers, and later served in Virginia on the staff of General Joseph E. Johnston. In 1863 he again acted as diplomatic agent for the Confederacy, first in Europe with L. Q. C. Lamar and then in Mexico with General William Preston. Subsequently he became adjutant-general of the trans-Mississippi department under General Kirby Smith. At the close of the war he resumed the practice of law in New Orleans, and later was called to the chair of French, Italian, and Spanish in the University of Louisiana. This position he retained until 1884, when he went to Europe as commissioner of the New Orleans Exposition. In his first administration President Cleveland appointed Mr. Fearn minister to Greece, Roumania, and Serbia; under the second Cleveland administration he was a judge of the International Court at Cairo, Egypt.

FEDERATION OF LABOR, AMERICAN, established in 1881, had in 1899 an estimated membership of 700,000. The nineteenth convention was held in Detroit, Mich., December 11-20, 1899; the convention of 1900, to be held the second Monday in December, at Louisville, Ky. The gain in membership during 1899 was 144,282; the report of strikes showed 425 won, 39 compromised, 89 pending, and 48 lost. The *American Federationist* is the official organ; in addition the association publishes many pamphlets and other papers. President, Samuel Gompers; secretary, Frank Morrison, Washington, D. C.

FENCING has increased in vogue during the past few years in the best class of sportsmen, and has taken a recognized place in college competitions. The college teams are annually entered in the contests in the junior championships at New York. These contests on April 1, 1899, resulted as follows: Harvard (36), first; Boston Athletic Association (31), second; New York Athletic Club (27), third. The American Fencing League's annual tournament was held at New York on February 17. In foils, Cecil Lyons, New York Athletic Club, won by a score of 250, with an allowance of 60; in duelling swords, R. Brownell won with 11½ points. In the national championships, at Boston, April 14-15, G. D. Kavanagh, New York Athletic Club, won in foils (10), and sabres (21), and M. de Diaz, Boston Athletic Association, won in duelling swords (10). The Fencing League's team championship, New York, April 20, was won by the Fencers' Club (3) from the New York Athletic Club (2).

FERDINAND I, PRINCE OF BULGARIA, the youngest son of Prince Augustus of Saxe-Coburg and the Princess Clémentine of Bourbon-Orleans, a daughter of Louis Philippe, was born in Vienna in 1861. He served as an officer in the Hungarian army, and after Prince Alexander was deposed in 1886, he accepted the offer of the throne of Bulgaria, and took his oath August 14, 1887. His sovereignty was, however, not formally recognized by the Porte and Powers until 1896. In view of the financial condition, Prince Ferdinand announced on November 10, 1899, that he would relinquish half of his Civil List for 1900, and the government decided that it would reduce the salaries of civil, military, and ecclesiastical functionaries.

In April, 1893, he married Marie Louise, daughter of the Duke of Parma, of the house of Bourbon. Princess Marie died at Sofia, January 31, 1899. She was born January 17, 1870. The death of the Princess Marie recalled the enmity that existed between her and the Bulgarian statesman, Stefan Stambuloff, whose death on July 18, 1895, resulting from a murderous attack upon him three days previously, was alleged by his friends to have been contrived by the princess. Being a Roman Catholic, she was deeply grieved at the admission of her eldest child, Prince Boris, into the Greek Church in 1896. Four children survived the princess, two sons and two daughters, the second daughter having been born the day preceding the mother's death.

FIELD, General Sir JOHN, K.C.B., was born in 1821 and died April 16, 1899. He entered the British army in 1839; saw active service in the Scinde and Afghan wars of 1840-44, in the Indian mutiny of 1857-59, and in the Abyssinian war of 1867-68. He was promoted to the rank of general in 1888.

FIELD, STEPHEN JOHNSON, LL.D., associate justice of the United States Supreme Court, retired, died in Washington, D. C., April 9, 1899. He was the son of the Rev. David Dudley Field, D.D., and was one of seven brothers, three others of whom won a permanent and honorable place in American history—David Dudley, the eminent jurist; Cyrus West, the projector of the Atlantic cable, and Henry Martyn, clergyman, author, and editor of the *Evangelist*, who alone survives. Justice Field was born at Haddam, Conn., November 4, 1816. When the boy was three years old his family moved to Stockbridge, Mass., and at the age of thirteen he went abroad with his sister and brother-in-law, who was a missionary, and passed three years in Greece and Smyrna. This sojourn proved to be of great educational value to young Field, for he not only studied Greek and other languages, but he

observed the political and social conditions of the East and had opportunity to see the results of war and pestilence. Returning to the United States, he entered Williams College, and was graduated in 1837 at the head of his class. He studied law in New York, and being admitted to the bar, began practice in that city as a partner in the firm of his brother, David Dudley. He withdrew from the firm in 1848, and passed a year in Europe. In 1849 he went to California, and the following year was made the first alcalde of the new town of Maryville. The same year he was elected to the legislature, but he held the position of alcalde until the judiciary was organized under the constitution of the State. In the legislature he was chairman of the judiciary committee. The result of his work touching the powers of courts and judicial officers is largely embodied in the code of the State; and the laws he effected regarding mines and mining have been extended to the other mining regions of the country and finally adopted by Congress. His influence upon the establishment of mining laws and usages was continued after he was elected to the Supreme Court of California in 1857 and after he succeeded David S. Terry as chief justice two years later. It was largely his decision also that placed the laws of real property on a firm basis. It is said that out of the lawless conditions in California he evolved a legal system, and that in conformity with his principle that "usage and customs which necessity has established must be law, except when in conflict with the constitution of the State," were the statutes of California formed.

A Republican President, Abraham Lincoln, appointed Judge Field, a Democrat, an associate justice of the United States Supreme Court in 1863, and the career then entered upon was destined to be the longest in the history of the supreme bench. Though many celebrated principles were established by Justice Field in this court, only a few of his more notable acts can be mentioned. In the famous "test-oath" cases he rendered the opinion that proof of treason is as necessary as proof of any other crime, and that persons who had participated in the Rebellion be released from the disabilities imposed by the statutes which had been passed during the war. In a dissenting opinion he denied that Congress has the right to exercise coercive authority over judicial officers of the States in the discharge of their duties under State laws. Another dissenting opinion, which is held to be of high importance, he delivered in 1870, when he denied the power of the government to alter the currency standard. Still another dissenting opinion of his held that an income tax law is thoroughly unconstitutional. In 1869 Justice Field was appointed professor of law in the University of California. In 1873, by appointment of the governor, he served as a commissioner to examine the codes of California and to prepare amendments. He was a member of the Electoral Commission of 1876, which, many believe, made the error of placing Hayes, instead of Samuel J. Tilden, in the Presidential chair. Field, however, was one of the seven members who voted for Tilden. In 1880 at the Democratic National Convention in Cincinnati he received 65 votes on the first ballot for the Presidential nomination. In 1889 an attempt was made on Justice Field's life by Judge Terry, with whom he had formerly been associated on the California bench; but before Terry could fire the revolver which he had drawn, he was shot and killed by Marshal Naegle.

Justice Field had a strong dislike for President Cleveland, and was determined that the latter should not appoint his successor. His resignation accordingly was not tendered until after the inauguration of President McKinley, and it took effect December 1, 1897. He had completed a longer term of service than any other Supreme Court justice—amounting to thirty-four years and six months. According to his own statement, Justice Field alone wrote 57 opinions in circuit court, 365 opinions in the Supreme Court of California, and 620 in the Federal Supreme Court—1042 in all. Notwithstanding his prominence in California and his inestimable service to that State, it is said that he was not popular there, the reason being due to his alleged friendliness toward corporations; on the other hand, the citizens of Chicago hold him in kind remembrance for a decision he rendered against a corporation, whereby he saved to the people the lake front of the city against the proposed encroachment of the Illinois Central Railroad. At the time of his death a well-known paper said: "His decisions were always on the side of personal liberty, and he adhered firmly to what he deemed right, regardless of policy or pressure. His absolute disregard of prevailing public opinion and even of bodily harm in doing his duty was proved in many ways." With the passing of Justice Field, America lost an eminent lawyer, an honorable judge, and a noble citizen.

FIELD, WALBRIDGE ABNER, LL.D., chief justice of the Supreme Judicial Court of Massachusetts, died at his home in Boston, July 15, 1899. He was born at Springfield, Vt., April 26, 1833; was graduated with the highest honors at Dartmouth College in 1855; in this year he went to Boston, studied law, and in 1860 was admitted to practice. From 1865 to 1869 he was assistant United States attorney for Massachusetts, and in 1869-70 was assistant United States attorney-general. In 1876 he was elected to Congress, as a Republican, and occupied his seat until the Demo-

cratic House gave it to Mr. Dean, March 28, 1877. Field was re-elected, and served in the next Congress. In February, 1881, he was appointed by Governor John D. Long to the bench of the Supreme Court. By the appointment of Governor Roger Wolcott, Judge Oliver Wendell Holmes succeeded Judge Field as chief justice of the Supreme Judicial Court of Massachusetts.

FIELD COLUMBIAN MUSEUM. See ANTHROPOLOGY IN AMERICA.

FJI ISLANDS are a group of over 225 volcanic and coral islands in the South Pacific Ocean, of which nearly two-thirds are uninhabited. The two largest islands are Viti Levu, area 4250 square miles, and Vanua Levu, area 2600 square miles. The total area of the group is 8045 square miles, and the population is something over 120,000, which includes 3900 Europeans, 1200 half-castes, and the remainder Indians, Polynesians, Rotumans, Fijians, etc. The group belongs to Great Britain, and is known as the Fiji colony. It was acquired in 1874, in which year it was voluntarily ceded by the chiefs and people. The island of Rotumah, population 2400, to the north of the group, was added to the colony by Great Britain in 1881. Fiji is administered by the British high commissioner and consul-general for the Western Pacific, acting as governor of the islands, who appoints the legislative council, a body of six official and six unofficial members. In civilization and trade the Fiji Islands have made progress. The climate, though tropical, is not unhealthful, as shown by the large colony of Europeans resident in the islands. The soil is fertile, and produces for export sugar, copra, fruit, cotton, maize, and peanuts. Pearl shell, tobacco, and distilled spirits are also exported. According to a United States Consular Report, invested capital has given a good return, exports exceed imports, and the population is increasing. The total revenue for 1898 was \$458,249 and the expenditures, \$426,276, giving a surplus of \$31,973. The total imports amounted to \$1,142,893 and the exports, \$2,599,222, there being a slight decrease in imports and an increase of nearly 20 per cent. in exports within the year. The principal exports in 1898 were as follows: Copra, \$307,266; fruit, \$123,948; distilled spirits, \$67,576; sugar, \$1,950,897; maize, \$12,035; peanuts, \$12,721; pearl shell, \$11,329. There is little or no direct trade with Great Britain, but a considerable amount is carried on with the British colonies of New Zealand, New South Wales, Victoria, and New Caledonia. Excluding two state public schools (with 200 pupils) and one industrial school, education is carried on almost entirely by the Wesleyan missionaries, who teach over 35,000 native children, scattered through 2064 schools. The Roman Catholic mission maintains 141 schools, which accommodate 2000 scholars. The latter have 3 schools for Europeans also, with an attendance of 150 among the three. The Wesleyans were the earliest missionaries to attempt the conversion of the natives. They had in 1897, 972 churches and 339 other preaching places, with an attendance of 95,056. The Roman Catholic churches had an attendance of over 9000.

FINANCE. The treatment of financial topics may be found in the articles on the various countries. See also the articles BANK-BANKING; CURRENCY REFORM; MONEY.

FINLAND, formerly a grand duchy, but now a Russian province, was the object of considerable discussion in 1899 on account of the loss of its constitutional liberties and the measures taken by the Czar for the Russianization of the duchy. There was a general expression of sympathy for the Finns, which was especially strong in America. In Europe the agitation took an active form in the appointment of a committee of citizens, representing all the nations of western Europe, to plead the cause of Finland before the Czar. The attitude of Russia in regard to her Finnish policy remained unchanged throughout. It seemed, from the American point of view, that the most effective possible means were being taken to alienate a portion of the empire long distinguished for its loyalty and for the capable character of its people. Finland has fallen a victim, in fact, to the characteristic imperial policy of "Russification," which has already affected the Poles, the Jews, the German Lutherans about the Baltic, and other races—a policy which seeks to obliterate individual and race distinctions, break up local traditions and customs, disintegrate local governments, and bring down the people to the dead level of Russian national mediocrity. The Finns, whose case is no less significant than that of the disintegration of Poland, are among the most loyal and intelligent races in Russia, and possess the remarkable record for that dissatisfied country of having furnished not one conspirator, yet they have been deprived of their constitutional rights and autonomy, guaranteed them by successive emperors since 1809, and have been curtailed in the exercise of their native religion, language, and customs. Finland was conquered in the twelfth century by Sweden, and was at a later period possessed alternately by Sweden and Russia, becoming permanently Russian in 1809. Within all these periods and through the present century local customs have continued to develop in Finland, together with native language and free religion. The people minded their own affairs

and fulfilled their duties as Russian subjects, and developed within their local national sphere a high order of education, science, and arts. The local government was administered by a national parliament of its own, consisting of representatives of the four estates—namely, nobles, clergy, burghers, and peasants, whose assent was necessary to new taxation or changes in the constitution. The Emperor of Russia, who was the Grand Duke of Finland, summoned this assembly and in legislation had the right of initiation and veto. The highest administrative authority was exercised by a senate, sitting at Helsingfors, whose members were nominated by the Emperor and presided over by the governor-general of Finland. This senate was for the control of provincial affairs, while foreign and military affairs were mostly directed by the imperial officials. The constitution expressly stated that the army of Finland, commanded by native officers, could not without its own free will and the consent of parliament be taken outside the country to serve in any part of the empire. There is one exception, the life guards, who are soldiers immediately attending the person of the Czar, and Finland has had the distinction of having the guard drawn from her citizens since the time of Alexander I. But in 1898, by an imperial ukase, the constitutional military privilege previously mentioned was endangered, and an extraordinary session of the Diet, or parliament, was opened in January, 1899, to consider the question. While the Diet was sitting an imperial decree ordered that a knowledge of Russian would be obligatory for all senators, governors, and higher officials, and this was followed by a manifesto ordering that all new laws, instead of being affected by assent of the Diet, should be sent for final settlement to the Imperial State Council. These decrees, as the Finns were aware, were definite steps taken by Russia toward the breaking down of the historic constitution of Finland. The Diet and the senate strongly opposed the manifesto and sent a large delegation to St. Petersburg with a petition signed by nearly 600,000 Finns. The Czar refused both audience and consideration to the delegates. Thereafter the Diet declared that the manifesto did not possess the force of law in Finland—in other words, that it was unconstitutional, and that a law relating to military service (as stated above) could not be legally enacted, except in conformity with the Diet's decision. The Czar, under the policy apparently that kings know no law, declared that the manifesto was unshakable. He promised to take the Diet's opinion into consideration in finally drafting the military law. The close of the year, however, found Finland no longer a state in Russian eyes, and the office of grand duke has been abolished by the emperor, together with the dukedom. Whereas, also, Finland had its own constitution, supreme in part, with flag, currency, postage, state language, and free religion, with only citizens holding offices, there is now complete Russian domination in government, Russian officials are supplanting Finns, the army must serve for the empire, instead of being confined to the state, religious tolerance will be curtailed, all officials must be sworn in by the Russian Orthodox Church rites, Russian succeeds the Finnish and Swedish official and legal languages, newspapers are suppressed, and the country has, in fact, lost its national existence. This revolution has been such a blow to the liberty-loving Finns that the capital was draped in mourning after the return of the commission from St. Petersburg. Plans are reported for emigration in large numbers to Canada and America, including not only young men who wish to escape the conscription laws, but many others who fear that with the abolition of Finnish national life will come also the curtailment of personal liberty.

Finland has a population of about 2,500,000 inhabitants and an area of 144,255 square miles. Its chief exports, amounting in 1897 to 168,700 marks, are forest products, butter, paper, cardboard, iron and iron manufactures, sent to Russia, Great Britain, Denmark, France, Germany, Sweden and Norway, and Spain. The imports amounted to 202,500 marks. The chief crops of the country are oats, rye, barley, potatoes, peas, wheat, and flax; the manufactures include iron and mechanical works, dress and dyeing establishments, wood and bone industries, and leather, paper, chemical, and textile works. Fisheries and cattle-breeding are also important industries. The state has built and owns over 1500 miles of railways. In religion, the Lutheran Church numbers about 2,500,000 members, and the Greek Orthodox Church, 46,509. As to education, there are some 1400 schools, supported in part by the state. There is a university at Helsingfors with an attendance of over 2000. As an experiment the university has introduced a system of coeducation.

FIRE-PROOFING. See TALL BUILDINGS (paragraph Fire-proofing); GRAIN ELEVATORS; CLAY.

FIRE PROTECTION. Improvements in municipal fire protection during the year consist chiefly in securing a more ample and reliable supply of water, with better means for distributing it through the city or town, and of concentrating it where needed in time of fire. Larger water mains and better fire hydrants are being introduced in many cities. Various devices are being more commonly employed for testing at intervals the pressures of water-works systems. These consist chiefly of

cheaper and more convenient methods of attaching pressure gauges to fire hydrants. One such device has recently been perfected by Mr. F. B. Sanborn, of the Factory Mutual Insurance Company, of Boston, Mass., and another, recently described, was perfected by Mr. John Stagg, chief of the Fire Department of Paterson, N. J. An extensive series of tests of fire hydrants, made in 1897-98 for the Water Department of Holyoke, Mass., by Mr. Charles L. Newcomb, was reported early in 1899. The most significant results of the test were the small range of friction losses caused by most of the makes of hydrants tested and the fact that these losses might be still further reduced by more care in designing the waterways of the hydrants and in removing all projections and angles, as far as possible, in the finishing process.

From San Francisco it is reported that a new style of fire-fighter has been developed by Mr. H. H. Gorter, of the local fire department. It is designed to concentrate the streams from a number of lines of hose into one solid and powerful stream, something after the fashion of the water towers used by many fire departments, but more readily adapted to use in narrow streets, and capable of throwing the water to low as well as high points. The apparatus is really a large fire nozzle so mounted that its stream can be turned vertically by means of a ball-and-socket joint and horizontally on roller bearings. The apparatus is mounted on a one-horse cart, and requires fewer men and horses for its operation than the ordinary water tower. During the latter part of 1899 the Fire Department of New York City made arrangements to test search-lights for use on fire engines, designed to aid in lighting narrow, dark streets and to throw light through windows into buildings. The search-lights are mounted on each side of the driver's seat, and the projectors may be dismounted and set up on the ground. The Fire Brigade of Paris has recently secured an electrically propelled hose wagon with seats for six men. The apparatus was designed under the direction of Capitaine-Ingenieur Cordier. The motor is of 90 volts and 25 ampères, and it is expected that the battery will give some six hours' service.

The following statistics relating to fire departments in the ten largest cities of the United States are reprinted from the *Bulletin* of the Statistics Department of the city of Boston for September, 1899:

CITIES.	Cost of Maintenance and Operation.	Firemen.	Steam Engines.	Chemical Engines.	Fire Hydrants.	Fire Alarms.	Fires.	Property Loss.	Population. *	Area in Acres.

FISH AND FISHERIES. The most important event of 1899 in the matter of fish and fisheries was probably the International Fisheries Conference at Stockholm in June. Although the questions considered did not concern American fishing interests, and our government had no part in the proceedings, yet the carrying out of the plans of the conference will prove of great interest to American scientists and fishermen, as well as to those of Europe. The conference was held at Stockholm, June 15-23, by invitation of the King of Sweden and representatives of Russia, Norway, Denmark, Holland, Germany, and Great Britain were present. The chief business was the drawing up of plans for a fisheries survey of the seas bordering on the countries represented. As finally adopted the report recommends a hydrographical and biological survey of the North Sea, the Baltic Sea, and parts of the Arctic and

North Atlantic oceans, under the auspices of the seven above-mentioned countries, France and Belgium being also invited to assist. Each country is to take charge of a certain portion of the area under observation, and it is hoped to have the work begin in the spring of 1901. While a large proportion of the work is physical or chemical, the plans for the biological survey are still quite extensive. The biological work, however, will be confined to a direct investigation of the fishes only, and other groups of animals are apparently not to be taken up. It is proposed to establish a central station to have charge of the work, and it is estimated that the cost of this office will be about \$24,000 annually. The report has called out a good deal of criticism in England on account of what seems to be two serious defects. In the first place, the biological investigations are too limited in their scope, and their programme is too vague, and furthermore those interested in British fisheries feel that a survey which does not include the English Channel and the Irish Sea is geographically too restricted to warrant the expense which the proposed plans involve.

There was no other important fisheries congress during the year, but the fishery boards of all countries have given additional evidence of their usefulness. The fishery board of Scotland, however, comes in for no little criticism in an important work by Professor W. C. McIntosh, entitled *The Resources of the Sea*. Dr. McIntosh is evidently opposed to restrictive measures, such as the prohibition or limitation of trawling and the closing of certain breeding areas. He thinks that fish reproduce with sufficient rapidity and in sufficient numbers, so that the number captured by man cannot permanently injure the species. This is certainly debatable ground, and many zoologists will probably question not only some of his conclusions, but the premises from which he draws them. Meanwhile the work that is being done by the Marine Biological Association at their Plymouth laboratory in connection with English fisheries seems to receive only favorable comment. During the summer of 1899 a most important report appeared from that laboratory, giving an *exact* account of the nature of the sea bottom and its fauna, on a selected strip near Plymouth, at a depth of from 28 to 35 fathoms. It is intended to make a similar careful survey of the bottom between the 30-fathom line and the shore. Another important contribution to the literature of European fisheries comes from the Bergen Museum, which has published a *Report on Norwegian Marine Investigations*. The first part deals with the hydrography and the plankton of the northern ocean, while the second part is given up chiefly to a consideration of the food of the cod, and is an important contribution to the natural history of that fish.

The United States Fish Commission.—The year 1899 has been one of great activity on the part of the commission, and in certain lines, at least, great advance is shown over the preceding year. The year ending June 30, 1899, showed a great increase in the total number of fish hatched and young fry set free. At the same time the scientific work of the commission has been prosecuted with unusual vigor. Never before have so many different localities been made the headquarters of fishery investigations. During the past summer these investigations have been carried on, as in the previous year, at Wood's Hole, Mass., and Put-in-Bay, O., and in addition at Beaufort, N. C., on the coast of Oregon, along the eastern tributaries of the Sacramento, in the Wabash basin, in the Monongahela basin in West Virginia, along the San Pedro River in Arizona, on Seneca Lake, N. Y., and in the Sebago and Cobscookseecontee Lakes in Maine. The commission has also united with Professor Alexander Agassiz in a very important scientific expedition in the Pacific, with the *Albatross* as headquarters. (See ZOOLOGICAL STATIONS, paragraph Albatross Expedition). The opening of a laboratory at Beaufort was an admirable step, and with Dr. H. V. Wilson as director the success of the season was assured. The commission's schooner *Grampus* and the steamer *Fish-Hawk* were at Wood's Hole most of the summer, and with the aid of the former further important investigations were made regarding the distribution of the tile-fish. The first four months of the year were spent by the *Fish-Hawk* dredging and collecting in the waters about Puerto Rico. Large collections were made in various groups of invertebrates, and have been distributed to specialists throughout the country. It is planned to issue the resulting reports as a special bulletin on the zoology of Puerto Rico. In September the *Fish-Hawk* went to Beaufort, where she has since been engaged in a biological and topographical survey of the oyster grounds of North Carolina. The season at Wood's Hole was a very successful one, remarkably so in the addition of a large number of species of fish to the known fauna of that region. These were chiefly obtained by seining in Katama Bay, at the east end of Martha's Vineyard. No less than 18 species were added to the list, bringing the total number of fishes known to occur in the vicinity of Wood's Hole up to 240, a larger number than is known from any locality in the United States, except Key West, where 250 species have been found. In one day 56 species were collected in Katama Bay, and 47 of these were at one haul of the seine.

The *Bulletin* of the commission has appeared in new dress, and is greatly improved in its appearance, while under the present administration of the commission its value as a scientific journal is greater than ever before. One of the most interesting of the recent publications of the commission is a memoir on *The Fresh-Water Pearls and Pearl Fisheries of the United States*, by Mr. G. F. Kuntz. It is an exhaustive history of the pearl fisheries in the United States up to 1898, and contains a mass of material which will be a surprise to most readers. The pearls are found in specimens of *Unio*, most commonly within the shells of *U. complanatus*. The industry dates from 1857, when the "queen pearl" was found in New Jersey. It was sold to the Empress Eugénie for \$2500, and is now said to be worth four times that amount. Tennessee, Kentucky, and Wisconsin seem to be the leading States in the industry. Since 1889 it is estimated that pearls worth over \$25,000 have been found in Wisconsin alone. The search for pearls has led to the destruction of the unios in some localities, and it seems probable that measures of some kind will have to be adopted to protect the industry. See ZOOLOGICAL LITERATURE; ZOOLOGICAL SOCIETIES (paragraph British Association).

FISHER, GEORGE PURNELL, ex-associate justice of the Supreme Court of the District of Columbia and ex-member of Congress from Delaware, died in Washington February 11, 1899. He was born in Milford, Del., October 13, 1817; was graduated at Dickinson College, 1838. He presided at the trial of John H. Surrat, who was charged with complicity in the assassination of President Lincoln. He was United States attorney for the District of Columbia, 1870, and first auditor of the Treasury, 1889.

FISHERIES SOCIETY, AMERICAN, organized in 1871, had in 1899 a membership of 235. General meeting for 1900 at Wood's Hole, Mass., second week in July. President, John W. Titcomb; corresponding secretary, J. E. Gunckel, Toledo, O.

FLAGG, REV. JARED BRADLEY, M.A., D.D., died September 25, 1899. Dr. Flagg was known as one of the earliest New York artists. He was ordained as an Episcopal minister in the early fifties, but he resigned from the ministry to devote himself to painting. He had studied as a boy in the studio of his brother, George W. Flagg, and afterward with his uncle, Washington Allston. Later he wrote a life of his uncle, which was published in 1892. At the age of sixteen Flagg painted a portrait of his father, which was exhibited at the National Academy, of which in 1849 he was elected a member. His portraits were features of the Academy exhibitions for many years. Among his figure pieces which attracted attention was "Hester Prynne in Prison." He was known chiefly as a portrait painter, among his canvases being a portrait of Commodore Vanderbilt, exhibited at the Centennial Exposition at Philadelphia in 1876. He painted a portrait, also, of William H. Vanderbilt, and other financiers were the subjects of his brush at various times. A picture of F. D. Tapen, president of the Gallatin National Bank, New York, is one of his latest and one of his best works. Dr. Flagg was granted his degree of Doctor of Divinity by Columbia. He studied at Trinity College as a youth, and was awarded an M.A. from that institution in 1861.

FLAGLER, Brigadier-General DANIEL W., chief of ordnance, U. S. A., died at Old Point Comfort, Va., March 29, 1899. He was born in New York, March 24, 1835; was graduated at West Point in 1861, and served through the Civil War. He served first in drilling volunteers in Washington, then was aide-de-camp to Colonel Hunter and to General McDowell, and was finally transferred to the ordnance department. He was assistant ordnance officer at the Alleghany arsenal; inspector of ordnance for the Mississippi River flotilla; chief of ordnance in General Burnside's North Carolina expedition; he served at the West Point foundry, and at the close of the war was in charge of the Tredegar Iron Works at Richmond, Va. He was brevetted captain for gallantry and meritorious services at Antietam, major at Fort Macon, and lieutenant-colonel for services rendered throughout the war. He participated in the following battles: Bull Run, Roanoke Island, Newburn, Fort Macon, South Mountain, Antietam, Fredericksburg, Chancellorsville, Gettysburg. For many years after the war he did excellent work in developing the Ordnance Department, serving at various arsenals throughout the United States. The order of these appointments was as follows: Watervliet Arsenal, New York; Augusta Arsenal, Georgia; Rock Island Arsenal, Illinois; Fort Monroe Arsenal, Virginia; Fort Union Arsenal, New Mexico; San Antonio Arsenal, Texas; Frankford Arsenal, Pennsylvania; and Watertown Arsenal, Massachusetts. In 1881 he became lieutenant-colonel of ordnance, and colonel in 1890. In the following year he was made chief of ordnance with the rank of brigadier-general. His service in this position, extending to the time of his death, was a notable success.

FLAX. The following statistics of the world's production of flax seed and flax fibre are published by the United States Department of Agriculture:

* Commercial estimate.

† Average for 3 preceding years.

‡ Average, 1892 to 1895.

§ Census 1893.

This table is not absolutely complete, as reports of the production in some countries are not available. There are no figures for the yield of Ontario, Canada, but the crop there seems to be steadily declining; the area under flax in 1898 was 10,720 acres. Also no estimates have been made of the German crop or of the Spanish crop, which seems to be of some importance. The Department of Agriculture, however, reports that for practical purposes the table is fairly complete.

FLETCHER, BANISTER, professor of architecture and building construction in King's College, London, was born in 1833 and died July 5, 1899. He was educated privately. He had a prominent position among English architects, and was one of the first to introduce faience work in street architecture. From 1875 to the time of his death he was district surveyor of West Newington and part of Lambeth. He had travelled widely on the continent. Professor Fletcher was a fellow of King's College and of the Royal Institute of British Architects. He published: *Sanitary Hints; Light and Air; Model Houses for the Industrial Classes; Quantities; Dilapidations; Arbitrations; Valuations and Compensations; London Building Art* (1894); and in collaboration with Mr. B. F. Fletcher, *History of Architecture*.

FLETCHER, THOMAS CLEMENT, ex-governor of Missouri, died March 25, 1899. He was born in Jefferson County, Mo., January 21, 1827; he studied law and was admitted to practice in 1857. In the Civil War he fought for the Union, was imprisoned for a time in Libby, and was promoted to the rank of brigadier-general of volunteers. From 1865 to 1869 he was governor of Missouri. He will be remembered as the first speaker in the first Republican convention held in a slave State.

FLORIDA, the southernmost State of the United States, has an area of 56,680 square miles. The capital is Tallahassee. Florida was admitted to the Union March 3, 1845.

Agriculture.—The following shows the production and value of the principal crops in the calendar year 1899: Corn, 5,093,370 bushels, \$2,699,486; oats, 320,454.

\$160,227; potatoes, 117,576, \$145,794; and hay, 8675 tons, \$133,161. Live stock, January 1, 1900, comprised, horses, 38,050, \$1,776,778; mules, 8521, \$610,096; milch cows, 113,108, \$1,888,904; other cattle, 299,712, \$2,512,036; and sheep, 76,074, \$128,870.

Industries.—The termination of war conditions in Cuba and the abolition of oppressive trade regulations maintained under Spanish authority gave Florida in 1899 a degree of commercial prosperity unknown for many years. This appreciation was strikingly manifested in increased bank transactions and railroad receipts, enlarged imports and exports, urgent demands for labor, cancellation of mortgages, and savings bank deposits. The first industry to be affected by the changed conditions was the phosphate. During 1898 the shipments aggregated nearly 555,000 tons. Of this, 340,000 tons were high grade, all of which went to foreign markets. The high-grade price did not average over \$5.50 per ton. In August, 1899, the quotations for future deliveries averaged \$9.75 per ton at the port. The supply in 1898 fell short of the demand, and in 1899, with more than 20 new plants and an estimated production of 100,000 tons in excess of the previous year, the supply was again insufficient. In ten months ending May 1, 1899, the exports of American phosphates amounted to nearly \$5,000,000. The United States furnishes about half the world's product, and Florida supplies the greater part of that half. During the fiscal year ending June 30, 1899, the collection of internal revenue on taxable manufactures aggregated \$682,422. There were 14 manufacturers of tobacco and 555 of cigars and cigarettes alone, and the production was 139,633,684 cigars, 6,224,920 cigarettes, and 28,026 pounds of smoking tobacco. Authoritative reports in November, 1899, concerning the orange crop in Manatee County, indicated an unusually rapid movement and an output of about 1,000,000 boxes. Much of the crop had been sold on the trees; all was of excellent quality; and growers were in high spirits over the good prices obtained.

Commerce.—During the fiscal year ending June 30, 1899, the imports of merchandise at the ports of Apalachicola, Fernandina, Key West, Pensacola, St. Augustine, St. Johns, St. Marks, and Tampa aggregated in value \$1,125,625, and the exports \$19,914,144, making the total foreign trade \$21,039,769, an increase in a year of \$8,333,524.

Railways.—The total new railway construction during 1898 was reported at 47.30 miles, and during 1899, 118.50 miles, giving the State a total mileage of 3219.15. The valuation of railway property, as computed for taxation in 1898, was \$18,547,535.

Banks.—On October 31, 1899, there were 15 national banks in operation and 10 in liquidation. The active capital aggregated \$1,150,000; circulation, \$366,477; deposits, \$5,960,637; and reserve, \$2,286,237. The State banks, June 30, 1899, numbered 20, and had capital, \$710,000; deposits, \$2,418,214; and resources, \$3,402,421. The exchanges at the United States clearing house at Jacksonville in the year ending September 30, 1899, aggregated \$11,528,154, an increase of \$691,975 in a year.

Education.—At the close of the school year, 1897-98, the school population was 171,100; enrolment in public schools, 108,455, and average daily attendance, 74,004. There were 2792 teachers, 2121 buildings used for school-houses, and public school property valued at \$755,824. The revenue was \$630,733; expenditure, \$668,242, of which \$559,856 was for teachers' salaries. There were 24 public high schools, with 68 teachers, 1054 secondary students, and 999 elementary pupils; 6 private secondary schools, with 17 teachers, 139 secondary students, and 1489 elementary pupils; 2 public normal schools, with 15 teachers and 295 students, and 3 private ones, with 19 teachers and 511 students. Normal training was also given in 4 colleges and 8 public high schools. Six colleges for men and for both sexes reported 6 scholarships, 80 professors and instructors, 810 students, 18,870 volumes in the libraries, \$19,000 invested in scientific apparatus, \$439,000 in grounds and buildings, and \$424,800 in productive funds, \$70,420 in total income, and \$213,765 in benefactions. In 1899 there were 168 periodicals, of which 17 were dailies, 125 weeklies, and 16 monthlies.

Finances.—The assessed valuations in 1898 comprised, real estate and railway and telegraph property, \$78,660,930; personal property, \$15,239,892; total, \$93,900,822, a decrease in a year of \$1,216,334, and the lowest total since 1890. The law now requires the assessment of taxable property at full cash value. The State tax rate for 1899 was \$5.50 per \$1000. On January 1, 1899, the total bonded debt was \$1,275,000, of which \$950,500 was held by State funds and the balance by individuals. All bonds held by individuals are to be refunded at maturity by act of the legislature in 1899. Of the interest-bearing notes for \$200,000 of borrowed money, the State paid off \$75,000 in 1898, and the school fund held \$100,000, and the internal improvement fund \$25,000.

Population.—As estimated by federal officials, the population on June 30, 1899, was about 520,000.

Legislation.—In 1899 a State Bureau of Vital Statistics was created. The State Board of Health was continued, and was authorized to examine all lodging-houses containing ten or more rooms, and to regulate their sanitary condition. The gov-

ernor was authorized to appoint a State Board of Eclectic Medical Examiners to examine graduates of the eclectic schools only. The Railroad Commission was given enlarged powers, and can now fix rates. Common carriers must give ticket agents certificates of authority to sell tickets, and all other persons are forbidden to sell the same. It was made a misdemeanor for any person other than an employee to uncouple cars, handle brakes, or interfere with the operation of railroads. Firing of guns from trains was forbidden, and it was also made a misdemeanor to "beat one's way" on a railroad. A system looking to the uniformity of text-books was introduced.

State Officers and National Representatives.—Governor, William D. Bloxh 7; secretary of state, J. L. Crawford; treasurer, James B. Whitfield; comptroller, W. H. Reynolds; attorney-general, W. B. Lamar; adjutant-general, Patrick Houston; superintendent of public instruction, W. N. Sheats; commissioner of agriculture, L. B. Wombwell. Supreme Court: Chief justice, R. F. Taylor; associate justices, M. H. Mabry and F. B. Carter; clerk, B. B. Wilson. The State legislature consists of 100 Democrats. Senators: Stephen R. Mallory, from Pensacola, and James P. Taliaferro, from Jacksonville, both Democrats. Representatives: Stephen M. Sparkman, from Tampa, and Robert W. Davis, from Palatka, both Democrats.

FLOWER, ROSWELL PETTIBONE, ex-governor of New York, died at Eastport, L. I., May 12, 1899. He was the sixth of nine children, and was born at Theresa, N. Y., August 7, 1835. When Roswell was eight years old his father, a wool-carder, died leaving little means for the support of the family. The boy obtained his education at the district school and the high school. He taught for a time, and at the age of eighteen went to Philadelphia, where he was employed for a few months in the dry-goods business. He then went to Watertown, N. Y., where he secured a position in a hardware store, and soon afterward became deputy postmaster. Remaining in the latter position for six years at \$600 a year he saved money and entered the jewelry trade, in which he was successful, and in which he remained until 1869, when he went to New York, and soon found himself appointed executor of an estate left by his brother-in-law, Henry Keep, and amounting to about \$4,000,000. It was in this way that Flower was introduced to the New York financial world, in which he subsequently became a great power. Forming a partnership with E. C. Benedict, he opened a banking office in Wall Street, and later bought a seat in the Stock Exchange. In a few years this firm was succeeded by R. P. Flower and Company, at the head of which Flower increased his capital and showed such excellent judgment in matters of business and finance that he came to be a recognized power in Wall Street, and was made a director in various corporations—particularly of railroad companies. In 1881 he was elected as a Democrat to the Fifty-seventh Congress, defeating Mr. William Waldorf Astor. In 1884 he was looked upon as a very possible Democratic candidate for the Presidency. He was elected governor of New York in 1891, defeating Mr. J. Sloat Fassett, the Republican nominee. Even his opponents acknowledge that his administration was conducted on the principles of a capable and conscientious man of business. Among his more notable acts as governor may be mentioned his purchase of the Fire Island Hotel with his own money at the time of the cholera scare, the appointment of Judge Maynard to the Court of Appeals, and the sending of the State militia to Buffalo to suppress the riots of 1892. On January 1, 1895, he was succeeded as governor by Mr. Levi P. Morton, and thereupon resumed the management of his financial interests. He built the Flower (homœopathic) Hospital in New York; with his wife he built St. Thomas's House in Fifty-ninth Street, New York, affiliated with St. Thomas's Church; and, with his brother Anson, he built a church in Watertown, N. Y. He was a man of unusual public spirit, and it was said that for a number of years before his death at least one-tenth of his income had been devoted to benevolent purposes. Flower's death caused almost a panic in the stock market, the quoted value of those properties in which he was thought to have a controlling interest falling in some cases as much 30 per cent. The quick recovery of these stocks, however, "was in large measure a tribute to the great confidence of the business world in Mr. Flower's sagacity as well as his integrity." His death was probably hastened by the heavy strain upon him of his great business projects.

FLOWER, Sir WILLIAM HENRY, K.C.B., British surgeon, died July 1, 1899. He was born at Stratford-on-Avon in 1831; was educated at University College, London. During the Crimean War he served with distinction as assistant surgeon to the Sixty-third Regiment. He was assistant surgeon in the Middlesex Hospital from 1859 to 1861, and from the latter year to 1884 was conservator of the Museum of the Royal College of Surgeons, and from 1870 to 1884 was Hunterian professor of comparative anatomy. Dr. Flower was president of the Anthropological Institute from 1883 to 1885, director of the department of natural history in the British Museum from 1884 to 1898, and president of the British Association in 1889. Among

his writings are: *Introduction to the Osteology of Mammalia; Fashion in Deformity, 1881; Introduction to the Study of Mammals, Living and Extinct, 1891; The Horse, a Study in Natural History, 1892; Essays on Museums, 1898.*

FLUORSPAR. The production in 1898 amounted to 7675 short tons, valued at \$63,050, a gain in value of 70 per cent. over 1897. This product came entirely from Marion and Crittenden Counties, Ky. The American product is used in the manufacture of hydrofluoric acid and opalescent glass; also as a flux in iron smelting.

FLYING MACHINES. See **AERIAL NAVIGATION.**

FOLLETT, DAVID LYMAN, justice of the Supreme Court of New York, died at his home in Norwich, N. Y., July 5, 1899. He was born at Sherburne, N. Y., July 17, 1836; was educated at the Oneida Conference Seminary, studied law at Norwich, and in 1858 was admitted to the bar. He was appointed by President Johnson in 1867 assessor of internal revenue for the nineteenth district of New York, and served until 1873, when the office was abolished. The following year, as a Republican, he was elected to the Supreme Court. He was renominated in 1888 and endorsed by the Democrats for a second term of fourteen years. Upon gubernatorial appointment Judge Follett had served as associate justice of the general term, fourth department; chief justice of the Court of Appeals, second division, and associate justice of the general term, first department. In 1887 he was chosen by Governor Hill to revise in collaboration with David Dudley Field and Judge William Rumsey the proposed code of evidence. Governor Morton appointed him in 1895 to the appellate division, fourth department, which position he held at the time of his death.

FOODS. A suggestion has been made to pass special national laws which shall protect the public against adulteration of food, and for the appointment of a National Food Commission. Professor A. S. Mitchell has epitomized his testimony before a committee of the Senate of the State of Wisconsin, as follows, pointing to some of the dangers that now threaten health: "That as chemist of the Wisconsin Dairy and Food Company for the past four years I had been engaged in investigating the character of the foods on the market. That before the passage of a State food law extensive adulteration of spices, syrups, honey, flavoring extracts, and baking powder was being practised. That special previous laws had done much to control similar adulteration in vinegar and dairy products.

"That adulteration might be discussed under two general heads. The adulterants may be simply fraudulent, or they may be injurious or deleterious; the injurious substances generally being used simply for coloring, or for masking fraudulent sophistication, or as chemical preservatives. That in my opinion the rapidly increasing use of preservatives was a menace to public health and should be regulated.

"That in former days foods were preserved by aid of sugar, vinegar, and salt, all of which are proper constituents of food, or were kept by boiling or the use of ice. That at present chemicals were not only purchased under their own names for use in foods, but that antiseptics were placed upon the market under fanciful titles and accompanied by false and misleading statements of their properties.

"Quart packages of 'Freezine' and 'Special M Preservaline' were shown the committee, with the false statements on the label of the former, stating that it acts the same as ice, and that as it is a gas it escapes and leaves nothing in the milk, and that it cannot be detected by the chemist. The substances were stated to consist wholly of solutions of formic aldehyde. Its properties and uses were then described. I stated that other similar preservatives were on the market, and were much used by milkmen, especially in warm weather, and by those shipping milk by rail to the large cities. I gave it as my opinion that it did not 'act like ice,' that it was a powerful antiseptic, and deleterious in any amounts, and that its use was highly objectionable; that if cleanliness was exercised in the care of milk and it was properly aerated and cooled, its use was not necessary. 'Cream Albumenoid,' consisting of gelatine, boric acid, and borax, was shown as sold for use in 'improving' cream. 'Laketone,' a solution consisting of sulfonated anilin yellow, used for coloring milk and cream, was produced and discussed.

"The very common use of salicylic acid for preserving cider was referred to. (I have found grape-juice of a standard make and recommended for the use of invalids with weak stomachs to be heavily salicylated.)

"The use of salicylic acid in bottled beer was referred to.

"I stated that in my opinion a desirable policy would be to prohibit the use of all deleterious substances in all amounts, except in such cases as the substances were necessary ingredients in the manufacture of the product. For example, where there is a choice of yellows for butter colors, flavoring extracts, and confectionery, harmless vegetable colors must be used in preference to the brighter and more penetrating coal-tar colors.

"I then showed preparations of sodium sulfite, intended for use in chopped meat and hamburger steak. 'Rosaline,' a colored mixture of borax, nitre, and salt, sold for use as a sausage color and preservative, was shown.

"After a somewhat lengthy discussion of jellies, syrups, baking powders, and various food products, I strongly recommended national food legislation and the establishment of a National Food Commission.

"Such a commission would not only prevent the sale of injurious and deceptive goods, but it and the national law would serve as a model for State legislation, tending to uniformity in the various States. As it is at present, while the State officers can reach and control the manufacture of food products within the State, they cannot reach dishonest manufacturers shipping goods in from the neighboring States, but are forced to hold the retailers responsible."—*Philadelphia Medical Journal*.

FOOTBALL. The football season of 1899 furnished many genuine surprises and was full of opportunity for ambitious teams to improve their rank. The settlement of the collegiate championship was a question of unusual interest, owing to the complexity of the scores and the consequent difficulty of team classification. The most important results of the year were the notable improvement in play among the colleges at large and the consequent evening up of ranks, and the development of the game to a higher plane of sportsmanship than ever before. The widespread development of the game in 1899 compelled recognition not only of the growth of team work in the East generally, but of the rate at which the Western and middle-Western colleges are coming to the front. More intersectional games than usual were played, including a game for the first time between institutions of the Atlantic and the Pacific States. The solidity of the so-called "big four"—Harvard, Princeton, Yale, and the University of Pennsylvania—was threatened at various times during the season by several of the teams of the second class, which have for a number of years been knocking for admission into the first group. Cornell was ambitious in 1899 to lay claim to a higher rank even than that of the year before; Lafayette was also an important factor in the season of 1899, while the rise of Columbia in a single year to a position commensurate with her football prestige of some years ago was an unexpected feature of the season, and further complicated the question of the final rank of the more important Eastern teams. Brown and the Carlisle Indians also made an exceptionally good showing.

Harvard, by her generally consistent work, with not a defeat, was conceded the first position in the football world until the very end of the season, when her tie game with Yale, 0 to 0, and the defeat of the latter college by Princeton, 10 to 11, introduced a rival for championship honors. The placing of other teams furnished endless speculation. Cornell lost rank through her defeats by Lafayette, 6 to 5, and Pennsylvania, 29 to 0, and the season's rounding out of Princeton and Yale placed her at fifth place, although she had defeated Princeton, 5 to 0, and beaten Columbia, 29 to 0, who had defeated Yale, 5 to 0. Second place was later in the season claimed by Lafayette, by virtue of her defeating Cornell, and Pennsylvania, 6 to 0, and by proxy Princeton and Yale. Columbia having defeated Yale and doubled the score made by Harvard, Princeton, and Yale against Dartmouth, also felt entitled, until decisively beaten by Cornell and the Indians, 45 to 0, to a high place. These teams—that is, Columbia, Cornell, and Lafayette—are conceded fifth place, critics differing as to the relative rank of the three. The inconsistency of playing with relative scores has perhaps never been so well illustrated as in 1899. Thus, the end of the season, after a long period of newspaper discussion, found the personnel of the "big four" unchanged. There are differences of opinion among even the best critics as to the relative ranking of the remaining teams. The matter is in a way trivial compared with the more important and highly satisfactory increase in good football played during the year, but it is nevertheless a subject of some interest. Combining the various opinions of football critics, the order of Eastern teams is something like this: 1, Harvard, Princeton; 3, Yale; 4, Pennsylvania; 5, variously assigned, Cornell, Lafayette, Carlisle Indians, and Columbia; 9, Brown; 10, West Point; 11, Annapolis; 12, Wesleyan. Owing to certain eligibility rules, principally as to the number of years a man may play, which differ from the rules adopted by the college teams, some critics exclude West Point, Annapolis, and Carlisle from the intercollegiate list. Columbia should also be omitted in 1899, since she did not conform to certain accepted intercollegiate rules as to the personnel of her team. The spirit of her play was otherwise fully up to the average.

The colleges of the middle West played six games with Eastern colleges. The University of Chicago tied Pennsylvania, 5 to 5, and defeated Cornell, 17 to 6, and Brown, 17 to 0; Wisconsin was beaten by Yale, 6 to 0; Michigan defeated Virginia, 38 to 0, and was beaten by Pennsylvania, 10 to 11. Chicago had the strongest team of the middle West, winning her seven games in the Western League and being scored against only by Notre Dame and Iowa State universities. Wisconsin won

all her Western games but one, losing to Chicago, 17 to 0. In the far West the University of California defeated Leland-Stanford University, and later the Carlisle Indians crossed the continent and defeated the California team by a score of 2 to 0. In the New England League games among the four principal smaller colleges, Wesleyan was most successful, defeating Dartmouth, 11 to 0; Amherst, 40 to 0; and Williams, 11 to 5. In the far South football showed a decided advance in 1899. Sewanee University had by far the best team, comparing favorably with the smaller teams of the North.

The most prominent non-collegiate elevens were those of the Carlisle Indians, West Point, and Annapolis. The red men put to rout both Pennsylvania, 16 to 5, and Columbia, 45 to 0; and though defeated by Princeton, 12 to 0, and Harvard, 22 to 10, gained two goals against the latter. The West Point Military Academy and the Annapolis Naval Academy, each of which contested with various college teams, were in 1899 permitted by the War Department to meet each other in football for the first time in several years. The game was played at Franklin Field, Philadelphia, by the courtesy of the University of Pennsylvania, and was attended by unusually distinguished spectators, including many State officials and prominent alumni of the two institutions. In one of the cleanest games of the year the army defeated the navy by 17 to 5. The result was a surprise, and was largely due to the able coaching received by West Point.

Some games not mentioned in the above account: Harvard beat West Point, 18 to 0; Brown, 11 to 0. Princeton beat West Point, 23 to 0; Brown, 18 to 6; Annapolis, 5 to 0; Lafayette, 12 to 0; Columbia, 11 to 0; Pennsylvania State College, 12 to 0. Columbia beat West Point, 16 to 0. Yale beat West Point, 24 to 0; Pennsylvania State, 42 to 0. Pennsylvania tied Brown, 6 to 6; lost to Harvard, 16 to 0, and beat Virginia, 33 to 6, and Pennsylvania State, 47 to 0.

FORCE, General MANNING FERGUSON, commandant of the Ohio Soldiers' and Sailors' Home, died May 8, 1899. He was born in Washington, December 17, 1824; was graduated at Harvard in 1845; studied at the Harvard Law School, and was admitted to the bar in Cincinnati in 1850. Being appointed major in the Twentieth Ohio Volunteer Infantry in August, 1861, he served through the Civil War, rising to the rank of brigadier-general, U.S.V., and major-general by brevet. From 1867 to 1877 he was judge of the Court of Common Pleas for Hamilton County, O., and from the latter year to 1887 he was judge of the Superior Court in Cincinnati. From 1878 to 1888 General Force occupied the chair of equity and criminal law in the Cincinnati Law School. He was commandant of the Ohio Soldiers' and Sailors' Home from 1889 to the time of his death. Among his writings are: Pamphlets on the Mound Builders and Indians; *The Letters of Vespuccius*; *Army Topics*; *From Fort Henry to Corinth*; *Notes to Walker's American Law*; *Notes to Harrison's Criminal Law*.

FORD, DANIEL SHARP, editor and proprietor of the *Youth's Companion*, died in Boston, December 24, 1899. He was born in 1822. While a young man he published and edited, with the late Rev. Dr. John W. Olmstead, the Baptist weekly known as *The Christian Watchman and Reflector*. In 1857 they purchased from Nathaniel Willis, father of the poet, N. P. Willis, the *Youth's Companion*, a juvenile paper founded by Mr. Willis. Mr. Ford, while acting as editor of the *Companion*, devoted his efforts toward publishing also the *Watchman*, which he was ambitious to make the leading religious paper in the country. Differences between the partners as to policy led to an amicable separation of interests, and the division, which was by lot, gave the management of the *Companion* to Mr. Ford. The name Perry, Mason and Company, under which the *Companion* is still published, is a purely fictitious firm name, adopted under the original partnership in order to avoid confusion of accounts. To Mr. Ford is due the development and present standing of the *Youth's Companion*, which in influence and circulation is to-day one of the leading juvenile papers of the United States.

FORD, SIR FRANCIS CLARE, G.C.B., G.C.M.G., British ambassador at Rome, died January 31, 1899. After his military service from 1846 to 1851 he entered the diplomatic service in 1852. He was the British agent for the commission at Halifax in 1875-77, under the twenty-second and twenty-third articles of the treaty of Washington. He was minister to Argentina in 1878-79, and in the latter year to Uruguay; in this year he was appointed minister to Brazil, serving until 1881. He was then transferred to the ministry at Athens, where he remained three years, being appointed in 1884 minister to Spain. While holding this position he was raised to the rank of ambassador in 1887, and five years later was transferred to the embassy at Constantinople. The following year he was appointed ambassador at Rome, which position he retained to the time of his death. During his service in Greece he was appointed (1883) British commissioner at Paris for the settlement of the Newfoundland fishery question. He was created a knight in 1889.

FORD, PAUL LEICESTER, author, was born in Brooklyn, N. Y., in 1865. He was educated privately, and has been an extensive traveller through North and South America and Europe. He has edited the *Writings of Thomas Jefferson* (ten volumes); the *Writings of John Dickinson* (three volumes), and other works relating to American history and bibliography. Publications: *The Hon. Peter Stirling*; *The Great K. & A. Train Robbery*; *The Story of an Untold Love*; *The True George Washington*; *Honors Are Easy* (staged by Charles Frohman); *Life of Franklin*; *Tattle-Tales of Cupid*; and *Janice Meredith*, one of the most successful novels published in 1899.

FOREIGN MISSIONS, AMERICAN BOARD OF COMMISSIONERS FOR, was organized in 1810, and is the oldest foreign missionary society in the United States. It had in 1899 a total missionary force of 3684, of whom 529 were from the United States, the remainder being native assistants. The latter number includes 343 women. There are 20 missions in Africa, Turkey, Ceylon, China, Japan, Sandwich Islands, Micronesia, Mexico, Spain, Austria, and India, the last named having 25 stations. There are 492 churches and 170 ordained missionaries, of whom 17 are physicians. The receipts for the last fiscal year were \$644,200. President, Samuel B. Capen; district secretaries, C. C. Creagan, D.D., 105 East Twenty-second Street, New York, and Rev. A. N. Hitchcock, D.D., 153 La Salle Street, Chicago, Ill.

FORESTIER-WALKER, Sir FREDERICK WILLIAM EDWARD, lieutenant-general in the British army, was appointed in August, 1899, to the command of the forces in South Africa to succeed Major-General Sir William F. Butler, who, it was said, had not been entirely in harmony with the policy of High Commissioner Sir Alfred Milner. General Forestier-Walker was born in 1844; educated at the Royal Military College, Sandhurst, he entered the Scots Guards in 1862. In the Kaffir war of 1877-78 he served as assistant military secretary, and during the Zulu war of 1878-79 as military secretary to Sir Bartle Frere; in the Bechuanaland expedition of 1884-85 he was assistant adjutant and quartermaster-general. He commanded an infantry brigade at Aldershot in 1889-90, and then the forces in Egypt until 1895. From the latter year until his appointment to South Africa he was in command of the Western District. He is a Knight Commander of the Bath and a Companion of St. Michael and St. George.

FORESTRY IN THE UNITED STATES. Attention to forestry conditions and needs in the United States has been aroused only in very recent years, but at the present time there is a widespread and growing interest in the subject. The reaction from the spirit of indifference to the rapidly wasting woodlands of the nation has come none too soon, for with the growth of the country and the development of its industries great inroads have been made upon the forests, and a market created which calls to-day for a round 40,000,000,000 feet of lumber a year. Seventy-five per cent. of this is of coniferous wood, which requires over three-quarters of a century to grow to maturity. The United States geological survey estimates that the present extent of forests in the United States is approximately 1,004,496 square miles, or about 37 per cent. of the area of the country, exclusive of Alaska. Seven-tenths of all the forests in the United States, it is estimated, are in the region between the Atlantic and the Mississippi. Of the remainder about one-tenth are in the interior Western States, one-tenth along the Rockies, and one-tenth on the Pacific coast. The latter region contains some of the largest trees in the world, and on the northwest coast are some of the densest forests of the temperate zone. Regarding the distribution as to States, Texas has the greatest extent of forests, about 64,000 square miles, although it also contains a great treeless area as large as the State of Pennsylvania. Next follow Oregon, Minnesota, and Arkansas. In relative amounts of timber Arkansas leads, with 84 per cent. of its area wooded, followed by Maine, Alabama, West Virginia, and North Carolina.

Forestry Principles.—Although the forests of the United States are disappearing at an alarming rate, they are still capable, under proper management, of filling for a long time the demands which may be made upon them. That such care has not been taken in the past is due both to ignorance and indifference regarding forestry needs, while existing opposition to the application of forestry principles is due to much the same causes. Recent discussions and events, however, have tended to make more clear to the people of the United States that forestry is in fact one of the economic arts, relying on the one hand upon unchangeable natural laws for the production of its crop, and on the other hand upon the settled economic laws and the principles of business. That applied forestry is a business is proved by the results in Europe, where it has been practised for over a century. Prussia spends annually about \$8,000,000 on her public forests, from which the income is about \$14,000,000; in France and Algeria the income is \$6,000,000, with an expense of \$3,500,000. It is also peculiarly a business for the state, since in America especially it must produce values for the future rather than for the present, with a decrease of present possible

profits. In order to bring about in this country results similar to those in Germany, for example, with its nine forestry schools, four of which are connected with universities, it is evident that we must utilize a corps of trained specialists, who shall enjoy equal prestige with those abroad. That provision has been made for the preparation of such at three large American universities within the period of 1898-99 is one of the most noteworthy and satisfactory steps ever taken in this country in the direction of forestry progress.

The National Forestry Policy.—The widespread interest in forestry problems and its rapid growth is shown by the creation during 1891-99 of 37 national forest reservations, with an estimated area of 46,021,899 acres, and proposals pending at the close of 1899 for nearly fifty additional reserves. The established reserves include the forest reservations proper and the national parks. The latter, in which lumbering is entirely prohibited and the game animals fully protected, include the Yellowstone, Yosemite, Sequoia, Mount Ranier, and General Grant national parks. As one result of the general and healthy interest manifested, the policy of establishing forest reserves is now, according to the 1899 report of the United States division of forestry, established beyond the reach of further question. After the bitter opposition which manifested itself against such a policy in very recent years this is a notable triumph. One of the consequences of the controversy, however, has been the disposal of the responsibility for these reserves among three different government bureaus—namely, the general land office and the geological survey in the Department of the Interior, and the division of forestry in the Department of Agriculture. The first administers and protects the reserves, the second maps and describes them, and the third, in which are all the trained foresters in the government service, has no relation whatever to this important branch of forestry work, according to the 1899 year book of the Department of Agriculture, except as the Department of the Interior may apply for assistance or advice. The connection of the United States geological survey with the forestry reserves will cease with the completion of its survey, but the complete separation which exists between the general land office and the force of trained foresters in the division of forestry in their relation to the reserves constitutes, according to the chief of the division, a serious defect in the organization of the federal forest work.

Work of the Division of Forestry.—The division of forestry, though not concerned with the immediate administration of the national reserves, became in 1898-99 an active organizer of practical forestry work in the woods throughout the United States, it alone among the three bureaus under discussion being held responsible for the progress of the science and art of forestry, and for the interests which are involved in the spread of conservative forestry over the enormous private holdings in the United States. The work of the division is carried on along four special lines. The first of these offers practical assistance to farmers, lumbermen, etc., in handling their forest lands. Applications were received during 1899 from 123 owners in 35 States for the management of 1,513,592 acres, of which 48 applications were for large tracts, covering together 1,506,215 acres, the remainder being for wood lots. Personal attention on the ground was given to 41 tracts, covering about 400,000 acres in 19 States. The working plans furnished to the owners were in a majority of cases carried out without further assistance, but 15 of the tracts received the active aid of the division, among the most notable being the Webb and Whitney preserves in the Adirondacks. A second line of work is the study and practice of economic tree planting, in especial relation to the treeless regions, and the study of commercially valuable trees. The loblolly pine in North Carolina, the red fir in Washington, and the coast redwood in California were among the more important trees considered in 1899. A third line is that of special investigations, which related in 1899 to forest fires, forest sections studied by local specialists, historical studies in State forestry progress, national forestry, and photographic forest description. See further regarding national forestry the article LANDS, PUBLIC (paragraphs on the Public Forests).

State Forestry.—Fourteen States exercise control of a more or less general nature over their forests—namely, Colorado, California, Kansas, Maine, Massachusetts, Michigan, Minnesota, New Hampshire, New Jersey, New York, North Carolina, North Dakota, Ohio, and Pennsylvania. Various forestry associations have been instrumental in advancing the spread of knowledge, particularly the American Association in Ohio, the Pennsylvania Association in Pennsylvania, the Boone and Crockett Club in New York, the Sierra Club, and the Water and Forest Society in California, the Mazama Mountain Club in Oregon, and the Massachusetts, Wisconsin, Minnesota, and Colorado Associations. Schools of forestry are soon to be established at the State University in California, and at Yale in Connecticut, and one was opened in New York in 1898, at Cornell. The Yale school will have a large demonstration area in Pennsylvania. The California school is endeavoring to obtain the management for a term of years of the new Lake Tahoe national forest reservation.

Progress, Especially in New York.—Consideration of the forestry progress of

New York is of value, because that was the first State to establish a forestry department and to place the forests under systematic management and control, and among the first to create a forest reservation, while it has instituted the beginning in the United States of professional teaching of forestry. The forests of New York cover nearly 12,000,000 acres of woodlands, of which over 3,500,000 acres are in a single tract, in the Adirondacks, and nearly three-fifths as much in the Catskills. The whole of its forests were practically granted away before and soon after the Revolutionary War, but in 1872 a few thousand acres, principally in the Adirondacks, had reverted to the State through tax sales, though in widely scattered lots. In that year the first step was taken to establish the Adirondack Park in a commission headed by ex-Governor Seymour. Verplanck Colvin, a member of the commission, who was one of the originators of the scheme and among the first to explore and describe the region, then almost unknown, has carried on the State's important Adirondack survey since that date. A second step was the refusal to further sale of State lands in the forest counties, and a third most important move the successful efforts of Governor Black in 1897 to increase the State holdings. Governor Black reported that there were over 1,250,000 acres of Adirondack forests "subject to fire and axe, and a yearly devastation appalling and disgraceful." In the previous year alone (1896) there had been cut nearly 184,385,000 feet of spruce, nearly 59,000,000 feet of hemlock, nearly 18,000,000 feet of pine, and about 9,000,000 feet of hardwood. Pulp mills took cord-wood equivalent to about 160,000,000 feet board measure, making a total of over 430,000,000 feet cut in the North Woods in one year, besides 37¼ million pieces of shingle and laths. Through Governor Black's efforts the State's Adirondack holdings were increased, by appropriations of \$1,500,000, to include up to the close of 1899 about 1,177,630 acres, or, including land purchased but not yet conveyed, 1,230,889. In the Catskills the area was increased to 58,386 acres, or 74,144, including land yet to be conveyed. The Hudson, Mohawk, Black, and Delaware rivers and the Erie and Champlain canals are fed from these sections, and power furnished to important industries, including the largest pulp mill in the world. In 1899 Governor Roosevelt furthered the policy inaugurated by Governor Black. The much-criticised law forbidding cutting on State lands has been caused solely by the selfish and rapacious methods of lumbermen. In order to bring about such intelligent lumbering as shall make possible the eventual opening up of the lands to careful cutting, plans were proposed in 1899 for forestry experiments, the first introduction of practical forestry among any State forests. Plans were submitted to the governor by the Boone and Crockett Club, and a special report was prepared by Mr. Gifford Pinchot, chief of the United States division of forestry. Other matters of discussion in 1899 were the probable appropriation early in 1900 of \$500,000 for further State purchases, and the announcement by the governor that a new and more effective fish, game, and forestry board would soon be appointed.

The First American Forestry School.—One of the most noteworthy courses of action taken by New York was in the establishment in 1898 of the State College of Forestry, the first institution of the kind in this country, for which reason a discussion of its objects and methods may be useful. This school has been removed from politics by being placed under the care of Cornell University, and it is given a period of thirty years in which to demonstrate the value of scientific forestry on a demonstration area of 30,000 acres, located in Franklin County, in the Adirondacks. Its objects are: (1) To train scientific foresters; (2) to obtain such knowledge by experimentation, etc., as may be applied in time to other and especially to State forest properties. The college offers a four years' course of prescribed and elective work, leading to the degree of Bachelor of the Science of Forestry (B.S.F.). The standard is high, requiring for entrance the same conditions as for entrance to the academic department of the university, including advanced preparation in linguistics and mathematics. This is partly due to the existence of forestry literature mostly in French and German, the desirability of Latin for technical nomenclature, and the knowledge of mathematical methods required in forest mensuration, statics, finance, etc. There are provided about 45 required and elective courses in mathematics, physics, chemistry, botany, entomology and invertebrate zoology, physiology, vertebrate zoology and neurology, geology, mineralogy and meteorology, political economy, civil engineering and topography, law, pisciculture, and forestry. The last named comprises courses which treat of economical and political aspects, silviculture, forest protection, timber physics and wood technology, exploitation and forest mensuration, regulation, administration, valuation, statics, finance, etc. The last year of the course includes seminary work and original research where possible. The college faculty, under the directorship of Mr. Bernard E. Fernow, former chief of the United States division of forestry, is supplemented by the teaching aid of about thirty heads of departments in the university, and the lecture rooms, laboratories, and museums of the university are thrown open to students in the college. One of the most important parts of the course is the summer field-work

on the college tract in the Adirondacks. The second object of the college, the gaining of experience for the State, is largely carried on in this tract. It is expected that it shall be made to pay from the beginning, but its main object is to serve as an experimental laboratory and for the presentation of object-lessons. After thirty years it is to be turned over to the State. It is hoped to demonstrate how wild woods may be treated, cut, and utilized; how waste places may be planted, young growth encouraged, and partly timbered areas made to reproduce the crop cut; how to secure a market and to transport and market woods cut; to insure a regular supply and to contract for a regular market, and to make the tract self-supporting by economy and systematic business methods, with the idea always in view of keeping the wood tract a permanent forest; also to study and to fight forest fires and to solve as far as possible problems at present unsolved.

Private Forestry.—Practical forestry in the United States began on private lands, the most notable instance being the systematic management introduced by Mr. George W. Vanderbilt among the forests of his estate at Biltmore, N. C., beginning in 1892. Practical government assistance to private landholders began in 1898, when the division of forestry took up the work already referred to in a preceding section of this article. According to the 1899 report of that department, the total area for the management of which assistance had been asked of the government was on December 31, 1899, more than 2,000,000 acres. Lumber companies and associations, as well as individuals, it is stated, are directing their attention with increasing seriousness and frequency toward practical forestry.

Forest Administration, etc.—The best forest fire laws outside the national domain are stated to be those of Maine, New Hampshire, Minnesota, New York, Pennsylvania, and Wisconsin. In New York each forest-reserve township has a fire warden and two or more district wardens, and these may call when necessary upon any citizen of the State to aid in fighting the forest fires. Minnesota has laws somewhat similar. The administration of the national reserves is treated for the year 1899 in the article LANDS, PUBLIC (paragraphs on the Public Forests.) Statistics of forestry proper are still somewhat general. In the preparation of this article the reports of the United States departments of agriculture, geology, and forestry, the New York forestry commission, land survey, and state forestry college, and other sources have been consulted.

FORMALDEHYDE. See INSECTS; SANITATION.

FORMOSA, an island lying off the coast of China, was ceded to Japan by China at the close of the Chino-Japanese war, in 1895. Its area is 13,541 square miles, and its population about 2,000,000. Formosa, which is about 200 miles long, is very mountainous, and certain portions of the interior are almost inaccessible. There live in those sections a primitive race of Malay origin. Formosa has several important coast cities, four of which are open to foreign trade. Besides having a commanding position, Formosa has been a valuable acquisition to Japan because of its products, which include tea, sugar, rice, and camphor. It has developed a large tea trade with the United States during the past quarter century, which has been greatly increased by the supplanting of Amoy (Chinese) Oolong tea by the Formosan Oolong. The production of this tea has been greatly stimulated in Formosa recently, and the appointment of a Japanese commission empowered to oversee the market has resulted in preventing the adulteration of the article, a practice which grew out of the prosperity of the trade. Japan has shown considerable activity in developing internal communication in the island since her acquisition of that territory, and many good roads have been built. The administration, which at first was faulty, was reorganized in 1897, after a native revolt, and the Japanese officials were enjoined to gain the good-will of the inhabitants by fairness and benevolent treatment.

FORTNUM, CHARLES DRURY EDWARD, D.C.L., a well-known collector of antiquities and a trustee of the British Museum, died March 6, 1899. He was born March 2, 1820, and was educated privately, becoming later an honorary fellow of Queen's College, Oxford. In 1840 he went to South Australia, where he made a natural history collection, and having returned in 1845, he travelled on the continent, where he pursued various studies and collected antiquities and works of art. In 1887 he presented to the Queen the diamond signet of Queen Henrietta Maria, and in the following year gave part of his collection to the University of Oxford. In October, 1897, he presented to the Queen the gold and sapphire signet ring of Queen Mary II. Among his publications are: *Catalogue of Maiolica, 1872*, and of *Bronzes, 1876*, in the Kensington Museum; various articles on *The Queen's Gems, 1876*; *The Diamond Signet of Henrietta Maria, 1882*; a historical treatise on *Maiolica, 1896*; *Early Christian Rings and Gems*.

FOSSIL BOTANY. A most important discovery has been the finding of plants of the Dakota group of the cretaceous in southeastern Argentina. These have been

known in the United States, and this new discovery indicates a wide distribution of this flora.

FOSTER, ADDISON G., United States Senator from Washington, was elected as a Republican by the legislature to succeed Senator John L. Wilson, Republican, February 1, 1899. Mr. Foster was born at Belchertown, Mass., in 1837. While a child he was taken to Oswego, Ill., and subsequently went to Minnesota, where he taught school and later entered the grain and the real estate business, in which he was engaged from 1859 to 1875. At one time he was auditor and surveyor of Wabasha County. After securing interests in timber lands he removed to St. Paul, where he resided a number of years, and then to Tacoma, Wash., his present home. In that State he has had an active interest in coal-mining and railway building, and at the time of his election to the Senate was vice-president of the St. Paul and Tacoma Lumber Company. His term will expire March 3, 1905.

FOSTER, BIRKET, English artist, died March 28, 1899. He was born at North Shields, February 4, 1825; was educated at Tottenham and Hitchin. In 1841 he became a pupil of E. Landells, the wood-engraver, by whose advice he became a draughtsman. In the early part of his career he illustrated many books, chiefly poetry, and did many drawings for the *Illustrated London News*. Among the books he illustrated were Goldsmith's works, Beattie's *Minstrel*, and Longfellow's *Evangeline*. In 1858 he abandoned illustrating, and devoted himself to painting in water color. In 1860 he was elected to the Royal Society of Water Colors, and subsequently gained distinction as an aquarellist. He published *Brittany*, a series of thirty-five sketches, and *Some Paces of Note in England*, a series of twenty-five drawings.

FRANCE has an area of 204,092 square miles, and a population, according to the census of 1896, of 38,517,975 inhabitants. The population includes 1,027,491 resident foreigners, most of whom are Europeans. The colonies, protectorates, dependencies, and spheres of influence of France have a total area estimated at 3,617,327 square miles, and an estimated population of 52,643,000. A notable fact regarding the population of France proper is its slow rate of increase, and this small increase is due mostly to immigration. There is a small preponderance of births over deaths, the figures for 1897 showing an excess of 119,000, but this difference is due to a falling off in the death-rate and not to any great increase in the number of births. The figures for 1899 show an increase of deaths of 59,054, and a decrease of births of 15,174. The emigration from France is small. There has been no religious census in France since 1872, but the three strongest sects at the present time are Roman Catholics, Protestants, and Jews. While religion is free, any sect which numbers 100,000 adherents is entitled to an annual grant of state money, and this was apportioned in 1899 as follows: Roman Catholics, 41,085,923 francs; Protestants, 1,495,100; Jews, 206,530. Nearly two-thirds of the French Jews reside in Paris. The populations of the principal cities of France, census of 1896, are: Paris, 2,536,834; Lyons, 466,028; Marseilles, 442,239; Bordeaux, 256,906; Lille, 216,276. Seven other cities have between 100,000 and 150,000 inhabitants.

Production.—In the production of two important articles, wheat and wine, France stands at the head of the list of European countries. The grape is cultivated to a very great extent, and yielded in wine nearly 710,212,000 gallons in 1898. In 1899 the French output of wine was increased to an amount estimated at 825,089,298 gallons. Some 250,000,000 gallons of cider were also made. In wheat France raises nearly one-seventh of the world's supply, being the largest European wheat-growing country. In 1898 France produced 372,049,474 bushels out of 2,806,076,700 bushels grown by the world at large. In 1899 French wheat amounted to 346,600,554 bushels, a falling off of 25,098,963 bushels from the previous year, but an amount sufficient to meet the general needs of consumption in France, owing to the amount of unconsumed stock of old wheat. The world production of wheat also shows a falling off for 1899, the figures being 2,515,000,500 bushels. This is the normal figure, the yield of 1898 being unusually large everywhere. France consumes much of her wheat, although she also exports quite largely. She imports to some extent, especially in hard wheat. The imports of the latter were about 4,250,000 bushels in 1899. In extent of cultivation the principal crops of France are as follows, the estimate being based on figures for the year 1897: Grains—Wheat 6,583,776 hectares, oats 3,990,565, rye 1,451,754, barley 857,911, maize 584,959, buckwheat 552,299, mixed corn 239,725; green crops—meadows and pasture 5,601,156, vineyards 1,621,567, potatoes 1,548,464, clover 1,119,335, beet root 439,139, sugar beet root 269,715, colza 52,342, hemp 32,843, flax 24,474 tobacco 16,831. See AGRICULTURE (paragraph Agricultural Teaching).

Industries and Commerce.—From a résumé of the commercial progress of France during the past thirty years, published in the *Bulletin de la Société de Géographie Commerciale*, there are given the following facts: The French postal traffic has nearly doubled; the telegraphic net is almost ten times greater; the tonnage of the

railroads has almost doubled; the number of travellers has tripled; the receipts have increased almost \$100,000,000; the discounts at the Bank of France have risen from \$1,279,204,000 to \$1,663,853,000; deposits in savings banks have increased from \$144,750,000 to over \$572,000,000, and deposits in banks and societies of credit exceeds \$289,500,000. As the population has increased but little these figures show the general commercial prosperity of France, which is in fact one of the leading trading nations of the world. The total trade of France in 1898 was \$870,430,080 for imports, \$680,381,040 for exports.

Notwithstanding her position as a foremost mercantile nation of Europe, France has been much concerned in recent years over the conditions threatening her commercial and maritime trade. There has been a noticeable decline in exports, and a strong foreign competition in the manufacture and production of articles formerly considered as belonging wholly to the French trade. The Marseilles chamber of commerce, while reporting a gain for the year 1898 of 163,943 in the tonnage entering Marseilles, compares this gain with the year's increase at other European ports, such as Genoa, a Mediterranean port, showing an increase for the year of 516,000 tons; Antwerp, with an increase of 646,000 tons, and Rotterdam, with 731,000 tons increase. Of quite as much importance to France as the diversion of her trade into channels other than her own is the gradual decadence of the French merchant marine. This is a subject of considerable interest to America, whose own fleet of merchant vessels has declined so greatly from the days of its supremacy before the Civil War, and whose enormous trade is so largely carried in foreign bottoms. The disappearance of the French flag from commerce, though for a time gradual, has lately become very marked. In 1896, according to the French press, 203 French ships, with 303,600 tons burden, were in the foreign trade; in 1897 the number had fallen to 191 ships, with 300,000 tons. The figures were not published for 1898. More startling figures were given for the years 1898-99, in a speech made before the special parliamentary commission appointed to consider the decline of the French marine. In 1898, according to this discussion, which was published in the United States Consular Reports for March, 1899, France was at the head of the list of ships passing through the Suez Canal. In 1899 France was fourth, as follows: England, 2161 ships; Germany, 322; Italy, 230; France, 218; Holland, 200. Additional testimony showing the comparative vitality of various national merchant marines were the statistics of growth presented to the committee. Within the past ten years Great Britain has increased her fleet of merchant vessels 33 per cent.; Germany has increased her marine 107 per cent.; Spain, 30 per cent.; Italy, 68 per cent., and Holland, 57 per cent. In France there has been a loss of 1 per cent. It was stated before the commission that at the present time only 25 per cent. of the vessels entering and leaving the French ports carry the French flag. Various plans have been suggested to arrest and recover declining trade and revivify the merchant marine. The decadence of the latter is said to have come about in spite of the large subsidies granted by the act of 1893. The high cost and slow building of French ships is one cause assigned for the non-increase of the French merchant fleet. Others are the defects in the subsidy laws, and the high freight rates of French ships. Some have complained because the extensive protective tariffs of France do not apply to French ship-owners, who can order their ships in England and bring them into France without paying duties. Most of the French vessels also are sailing vessels. In September, 1898, the tonnage of French sailing vessels in process of construction was 25,600, against 2693 for England and Germany's 150. Yet French steamers built aggregated only 50,000 tons, against England's 1,360,000 and Germany's 144,000. Remedies suggested include: A flag tax on goods not brought in French ships, as a complement to the protective tariff on foreign goods of whatever class; limiting colonial trade to French ships; cheaper transportation to the sea, to offset the present low rates to the foreign ports of Amsterdam and Antwerp.

Commercial treaties have recently been concluded with Italy and Japan, and also with the United States. The last named treaty was signed on July 24, and was to reach the United States Senate early in 1900. It is the first reciprocity treaty affecting American trade with a large commercial nation. Among the benefits to be received by the United States are a reduction of tariff rates averaging 20 per cent. on a large number of articles, among which are petroleum and mineral oils, cotton, copper, rubber, machinery, etc. Several of these, as cotton, enter France practically duty free. Among the articles excluded from this list are a number of important agricultural products, whose exception was insisted on by the French agrarian interests. France, on her part, will receive by the treaty a reduction of from 5 per cent. to 20 per cent. on duties now levied on over 100 chief French products sent to this country. Champagne is not among these, as France was not willing to grant large reductions in return for the lowering of duties on such wines. The treaty has been much discussed in France, being brought forward in the *Revue du Commerce Extérieur*, in August, as "one of the economic events of the second half of the nineteenth cen-

tury, meaning no less than the entrance of American manufactures on the European market, the commencement of manufacturing competition between the new world and old Europe." The *Revue* speaks of the tariff arranged by the new treaty as a partial abandonment by the United States of what the *Revue* calls the autonomous tariff—that is, one independent of the commercial needs of other countries, and the introduction of the conventional tariff, after the European fashion. The American policy did not tend to a generalization of the conventional tariffs, however, Article 3 of the customs law of 1897 having been enacted almost exclusively for the purpose of negotiating a treaty with France. The *Revue* considers that the commercial treaty with France has broken the first link in the chain which protected European industry against American competition. "The United States," it says, "will now invade with giant steps the markets of the continent. Its only drawback will be ignorance of commercial customs—the employment of measures other than metric, the lack of knowledge of the languages, the absence of assortments of goods suited to special needs, and the aversion of American exporters to granting credits. These obstacles are evidently not insurmountable. When the Americans have mastered them, our manufacturers will be placed in a very trying position."

A formidable opposition sprang up in the United States in regard to the ratification of the French treaty. The fruit-growing interests objected to the reduction of the duties on French preserved fruits and olive oil, and nearly every class of trade affected by various French importations made some remonstrance. The principal question, however, seemed to be whether the country as a whole would be benefited by the new treaty, and if so to what extent the special trade should be considered.

Currency.—By a convention which is renewable from year to year the five contracting states of France, Belgium, Italy, Switzerland, and Greece have agreed to have their gold and silver coins, respectively, of the same fineness, weight, size, and current value, making them interchangeable at par. This monetary system has been adopted wholly or in part in several European countries, including Russia and Spain, and in many South American countries. The common gold coins of France are the 10 and 20 franc pieces, and the silver coins are the $\frac{1}{2}$, 1, 2, and 5 franc pieces and the 20-centime piece. The amount of currency in France was estimated in 1897 to be 6,375,000,000 francs, of which 5,260,000,000 francs were in French coin. These were made up by 3,675,000,000 francs gold coin, 1,380,000,000 francs in 5-franc silver pieces, and 205,000,000 in fractional silver coin. (For later estimate see MONEY.) The Bank of France has the monopoly of issuing bank-notes. Its capital is estimated at 182,500,000 francs.

Army.—In conformity with the practice of other European powers, all Frenchmen who are not declared unfit are liable to military service from the age of 20 to that of 45. According to the budget for 1899, the peace strength of the army in France was estimated at 616,092 officers and men. The French army proper was placed at 547,515; in Algeria, 55,122; in Tunis, 13,455. Required army service includes 3 years in the active army, 10 in the reserve of the active army, 6 in the territorial army, and 6 in the territorial reserve. The war footing of the French army, including its reserve and territorial forces, is estimated to be for 1899 about 4,160,000 trained men, to which 4,000,000 untrained might be added. The gradual increase of the French army, provided for by a law of March, 1897, is steadily going on. The increase will eventually enlarge the peace footing of the infantry by 50,000 men.

Navy.—The naval strength of France was in 1899 second to that of Great Britain. According to the classification of the 1899 publication of the United States Navy Department on naval progress abroad, the French fleet was reported in July, 1898, to consist of 27 battle-ships, and 8 building; 9 armored cruisers, and 10 building; 30 protected cruisers, and 10 building; 16 unprotected cruisers; 14 coast-defence ships; 13 torpedo vessels, and 2 building; 8 torpedo-boat destroyers in course of construction; 211 torpedo boats, and 38 building, and 1 ship for special purposes. Various programmes for increasing the fleet have been presented, but none have been fully carried out. Some little comment was caused about the beginning of 1899 by the declaration of M. Lockroy, former French minister of marine, that the French war fleet, though second in size among the navies of the world, was merely an ornament, principally for lack of bases of supply, owing to the neglect to secure and improve coaling stations. In 1899 there were laid down 13 large and 28 small vessels, including several submarine boats, with a tonnage of 131,054. The number being constructed during the year was 34 large and 72 small vessels, with a tonnage of 255,533. There were launched 2 battle-ships, 4 cruisers, and 2 gunboats; 2 torpedo-boat destroyers, 1 torpedo boat, and 2 submarine torpedo boats.

Colonies.—France administers the affairs of over a score of colonies, protectorates, and dependencies, with an aggregate area of 3,617,327 square miles and an estimated population of 52,643,000. These territories are as follows: Asia: French Indo-China, including Anam, Cambodia, Cochin China, and Tonquin; Africa: Algeria, French Congo and Gaboon, French Soudan, Senegal, Guinea, Dahomey, Madagascar, and

Tunis; America: French Guiana, Martinique, Guadeloupe and dependencies, St. Pierre, and Miquelon; Australasia and Oceanica: New Caledonia and dependencies and the Society Islands. The total trade of these colonies in 1897 was \$78,600,980 for imports, \$85,686,358 for exports.

HISTORY, 1899.

The history of France in 1899 falls naturally under the three following heads: (1) The Dreyfus Affair, which in respect to the amount of comment that it occasioned overshadowed every other topic in the current history of France; (2) Internal Politics, so far as they were not inextricably bound up with the Dreyfus case, and (3) Foreign Affairs, including as their most important feature the conclusion of the convention with England in settlement of the conflicting claims to territory in the region of the Upper Nile.

I. THE DREYFUS AFFAIR.

Introductory Review.—A brief summary of the case down to the beginning of 1899 may be of service as an introduction to the record of the year. Captain Alfred Dreyfus, an officer in the French army, was convicted in the autumn of 1894 by a secret court-martial of having sold or given secret military information to a foreign power, presumably an enemy of France. Which foreign power it was did not appear, but suspicion at first turned to Germany and afterward to Russia. After a public degradation on January 4, 1895, he was imprisoned on the Ile du Diable, near the coast of French Guiana, whither he was transported March 10, 1895. For two years little was heard of the case, but in the autumn of 1897 there were rumors that attempts were being made to prove his innocence. In November, 1897, Mathieu Dreyfus observed the similarity between the handwriting in the chief document of the case, known as the *bordereau*, and that of Major Esterhazy. The latter officer was brought to trial in January, 1898, but was acquitted by the court-martial by a unanimous vote. A few days later appeared the famous "I accuse" letter of Émile Zola, who charged the general staff of the army with having conducted a partial inquiry and with suppressing proofs establishing the innocence of Dreyfus. While the main part of his letter dealt with the alleged rascality of the general staff in the matter of the Dreyfus case, the government took note only of the passages in the letter which accused the Esterhazy court-martial of having rendered an iniquitous verdict and knowingly acquitted a guilty man. M. Zola was brought to trial on account of this passage. In the meanwhile, the country was thrown into a state of great excitement. A small body of men set zealously to work to establish the innocence of Dreyfus, but the discussion of the matter brought out a more and more violent opposition, and this opposition identified itself with the anti-Semitic movement. Scenes of violence took place in the streets and in the chamber of deputies, and a spirit of disorder showed itself even in the court room when the trial of M. Zola began. In this trial few witnesses attended on behalf of the defence, while for the government the witnesses were chiefly officers of the army and members of the war office. It was the constant effort of the counsel for the defence to reopen the Dreyfus case, and this was as constantly opposed by the prosecution, who tried to confine all discussion to the question of the Esterhazy court-martial. The result was a verdict against Zola and of the publisher of the paper in which his letter appeared. Appeal was taken by the defence to the Court of Cassation on the ground that trial should have been brought not by the war office, but by members of the Esterhazy court-martial. This appeal was sustained, and the members of the Esterhazy court decided to push the case against M. Zola and the publisher. The second trial began on May 23, and the appeals of the defence having been dismissed, a decision against them was finally rendered. In the meanwhile, July 2, Zola left Paris. Soon afterward, on July 7, M. Cavaignac, minister of war, revived the excitement over the affair by a speech, in which he declared the reasons for his belief in the guilt of Dreyfus. His grounds were the alleged confession of the accused and the existence of three incriminating documents. The latter consisted of letters which were supposed to have passed between the Austrian military attaché in Paris, M. Panizzardi, and the German military attaché, Colonel Schwarzkoppen. No sooner had this speech been made and placarded throughout France than Colonel Picquart declared that two of the documents had nothing to do with the Dreyfus case and that the third bore all the marks of forgery. This third letter was the only one that expressly mentioned the name of Dreyfus. The next important event in the history of the affair was the confession of Colonel Henry that he had forged this third letter in the autumn of 1896. Henry was taken to prison and committed suicide by cutting his throat with a razor from his dressing-case. The alleged confession of Dreyfus appeared to rest upon flimsy evidence, so little was left of the grounds which M. Cavaignac had assigned for his belief in that officer's guilt. In the meanwhile, suspicion pointed more clearly to Esterhazy as the spy whose revela-

tions accounted for the systematic leakage of French military secrets. On September 9 Esterhazy left France, and was later reported to be hiding in London. The next important event was the arrest of Colonel Picquart late in November on charges of forgery and of revealing documents concerning the national defence. His case came up before the correctional tribunal, but was afterward transferred to military jurisdiction. In the meanwhile, the Dreyfusards had succeeded in inducing the cabinet to countenance a movement for revision. On September 26, after the revelations in the Henry affair had been made public, the cabinet decided that the demand for revision should be submitted to the Court of Cassation. The criminal chamber of this court decided on October 29 that there was ground for proceeding to a supplementary investigation, and on November 15 it notified Dreyfus that revision proceedings had begun. In the meanwhile, Colonel Picquart had applied for a decision upon the question whether a military or civil tribunal should have charge of his case, and on December 8 the court decided that the military prosecution should be suspended, and required that all the documents in the Picquart case should be submitted to it for examination. Public interest was now centred in the question whether the war department would submit to the court the secret documents in the case. On December 27 these documents, known as the secret *dossier*, were communicated to the court.

The Question of Revision.—On January 8, 1899, M. Quesnay de Beaurepaire, president of the civil chamber of the Court of Cassation, resigned his office and began a campaign in the newspapers against the members of the court, accusing them of gross partiality for Dreyfus and of virtually conspiring to exonerate him. He demanded that the case should be transferred from the criminal chamber to the court as a whole. The minister of justice upheld the integrity of the court and the senate supported him in this view. The question of submitting the case to the whole court was taken up by M. Mazeau, the first president of the Court of Cassation, and while he absolved the members of the criminal chamber from any suspicion of unfairness, he recommended that so important a matter should be decided by the entire court. An appeal for the transfer of all cases of revision, including the Dreyfus case, to the whole court was voted by the chamber of deputies on February 10 and approved by the senate on March 1. This entailed some delay, but it was more than offset by the additional weight given to a decision rendered by the entire body. The criminal chamber of the court was required first to make an examination into the affair. On March 14 the Picquart case was transferred from the military to the civil court. The inquiry of the criminal chamber into the Dreyfus case brought out some most important testimony. By some means the *Figaro* secured access to the secret proceedings of the chamber, and the revelations which it published made a deep impression upon the public mind. There were evidences of a change of sentiment and of a general feeling that the accusations made by the general staff rested on a very slender foundation of documentary evidence. Many of the newspapers that had bitterly opposed revision now came out in its support, and revision seemed to be favorably regarded by the majority of the people.

Revision Ordered.—On May 28 it was announced that the reporter of the court, M. Ballot-Beaupré, had reported in favor of revision on the following grounds: Documents had been submitted to the judges in the court-martial of 1894 which the defence had not seen; there were contradictions in the testimony of handwriting experts as to the authorship of the *bordereau*; the paper upon which the *bordereau* was written was the same as that used by Esterhazy; there was no proof that Dreyfus had ever confessed his guilt; Henry's confession changed the aspect of the affair; the change of a date in the *bordereau* strengthened the suspicion of Esterhazy's guilt; official documents proved that there were no relations between Dreyfus and the foreign embassies; finally the reporter said there was only one question before the court, and that was the authorship of the *bordereau*, and he declared his belief that it was not written by Dreyfus, but by Esterhazy. On June 3 the Court of Cassation rendered its decision. It quashed the decision of the court-martial of 1894 and ordered a re-trial by a new court-martial at Rennes, which was to decide upon the following question: "Is Dreyfus guilty of having in 1894 instigated machinations or held dealings with a foreign power or one of its agents, in order to incite it to commit hostilities or undertake war against France by furnishing it with the notes or documents enumerated in the *bordereau*?" In the meanwhile, on June 1, Colonel Du Paty de Clam was arrested on charges that arose out of the testimony brought before the Court of Cassation during its investigation. Soon afterward Colonel Picquart was released and the charges against him were dismissed. After the decision of the court, the *Sfax*, a second-class cruiser at Martinique, was ordered to the Ile du Diable to carry Dreyfus back to France. Dreyfus embarked at Cayenne on June 10 and landed at Quiberon on July 1; thence he was taken to Rennes to await the trial. There was great fear in some quarters of popular outbreaks as soon as Dreyfus set foot in France, and extreme precautions

were taken to avert this, but there was a general spirit of acquiescence, and no serious demonstrations occurred.

The Rennes Court-Martial.—In the meanwhile important political events had taken place, which, though they will be described at greater length in succeeding paragraphs, may be summarized here. In the midst of the agitation over revision occurred the death of President Faure, February 16, and on February 18 the National Assembly met at Versailles to choose his successor. M. Loubet was elected on a single ballot. There was great fear of serious popular disturbances, and there were in fact riots on the streets. President Faure's funeral was the occasion of a demonstration on the part of the Nationalists, and M. Déroulède and another deputy were arrested. A more important event that took place before the meeting of the new court-martial was the fall of the Dupuy cabinet and the formation of the Waldeck-Roussseau ministry, with General de Galliffet as minister of war. De Galliffet removed Zurlinden from the office of military governor of Paris, and employed disciplinary measures against officers who had been too outspoken in their opinions on the Dreyfus case. The first session of the new court-martial was held in the hall of the Lycée, at Rennes, on August 7. The president of the court was M. Jouaust, and the associates were Lieutenant-Colonel Brougniart, Commandant Profillet, Commandant Merle, Major de Bréon, Captain Parfait, and Captain Beauvais. Major Carrière, as commissary for the government, conducted the prosecution. After the preliminary examination of the prisoner the court went into secret session for several days to consider the *dossier* of the war office. Public sessions began on August 12. The first important event in the trial was the evidence of General Mercier, and a rebuttal of a portion of it by M. Casimir-Périer, the former president of the republic. Mercier declared that he still believed Dreyfus guilty, but his evidence was little more than a repetition of matters which were already known. In justification of the submission of secret documents to the court, he represented that there was grave danger of war between France and Germany. This was, however, discredited by Casimir-Périer. On August 14 occurred the cowardly attack on M. Labori, who was shot in the back while on his way to court. The assailants escaped, and the wound, though severe, was not fatal. On August 22 M. Labori had sufficiently recovered to resume his attendance at court. In the meanwhile a mass of testimony was given by members of the general staff and former members of the government, including Generals Billot, Zurlinden, Chanoine, Roget, de Boisdeffre and Gonse, Colonel Cuignet, and MM. Cavaignac, Hanotaux, and Lebon. The evidence of M. Bertulus and Colonel Picquart in favor of Dreyfus was widely quoted in all the Dreyfusard papers. The former accused the officers of the general staff of complicity with Esterhazy and implied the collusion of Esterhazy and Henry. Colonel Picquart said that the *bordereau* probably emanated from the department of Du Paty de Clam, who had been guilty of serious acts of imprudence in connection with the transmission and copying of confidential documents. The testimony of M. Bertillon, the hand-writing expert, consisted in so complicated an explanation of his "system" that it mystified the court and occasioned much ridicule among the public at large. The most exciting incident occurred, after M. Labori having recovered from his wound had returned to court, when members of the 1894 court-martial were placed on the stand. Colonel Maurel, who had presided over that court-martial, admitted that documents had been secretly communicated to himself and the other members of that court, but that he had examined only one of them. Captain Freystaetter, one of the judges of the 1894 court-martial, said that his belief in the guilt of Dreyfus was strengthened by these secret documents, and also testified that Colonel Maurel had made a commentary on each document as he passed it to the judges. Then followed an attempt to decide between the veracity of Maurel and Freystaetter. Captain Lebrun-Renaud declared that Dreyfus had said that if he had handed documents to Germany it was an exchange for more important ones. Dreyfus denied this, and Major Forzinetti, who was governor of the prison in which Dreyfus was confined, said that Dreyfus had always asserted his innocence. The defence complained that the witnesses for the prosecution always based their testimony on the words of persons who could not be summoned, that frequent reference was made to Sandherr and Henry, who were both dead, and that the testimony of Du Paty de Clam, who absented himself on the ground of ill-health, was not taken. A foreign witness, named Cernuschi, who was described as an Austro-Hungarian refugee, appeared before the prosecution on September 24, and caused a considerable sensation by declaring that Dreyfus had given important secrets to a foreign military officer. This gave M. Labori the opportunity to ask that the government should apply through the proper diplomatic channels to the power or powers whose representatives were concerned in this for the production of the documents named in the *bordereau*. On September 5 he telegraphed to Emperor William and King Humbert to allow their military attachés to give testimony at the trial. He requested the court to subpoena these witnesses. This was refused, and when the mili-

tary attachés announced that they could not come to Rennes, but would give their testimony before a commission, the court-martial refused to appoint the commission. Nevertheless to the people outside the court the following disclaimer on behalf of the German government carried conviction that Dreyfus had not been concerned in the dealings with Schwarzkoppen. This recited that the imperial government had never entered into any relations with Dreyfus, either directly or through its agents. Panizzardi had already published a similar disclaimer. The taking of evidence was completed on September 7. After speeches by Major Carrière for the prosecution and by M. Demange for the defence, and a final affirmation of innocence on the part of the prisoner, the court found the verdict of guilty by a vote of 5 to 2, but found extenuating circumstances, and condemned Dreyfus to ten years' imprisonment. An appeal from this decision was at once taken. The verdict was received with great delight by the anti-Dreyfusards, but there were no public disturbances, and, in spite of the dissatisfaction of the friends of Dreyfus, there was general acquiescence in the decision of the court. The members of the court-martial signed a recommendation to mercy on September 11, and on the 19th the council of ministers favored a pardon. The same course was recommended in a report by General de Galliffet, and President Loubet decreed a pardon on the 19th. On the following day Dreyfus left the prison at Rennes and went to his home at Carpentras, near Avignon. Upon his release he declared that while the republic had restored him his liberty, he should continue to seek for the restoration of his honor and to repair the judicial error of which he was still a victim.

Public Opinion of the Affair.—Outside France the verdict was received with indignation, and in several countries movements were started for the boycotting of the Paris Exposition of 1900. In England and the United States the comments on the chiefs of the French army, and the general attitude of the majority of Frenchmen, were especially severe. Nor could the miscarriage of justice be attributed solely to the influence of the mob alone. Frenchmen of the highest reputation for intelligence were vehement anti-Dreyfusards. M. Brunetière, one of the most learned, if not the most eminent, of French critics, called the Dreyfus affair the result of "the monstrous, abnormal, essentially morbid dilatation of self," and attributes the basest motives to the little group of men who championed the accused officer. In all foreign countries the prevailing opinion was that France had brought upon herself a lasting disgrace. The popular dislike of France did not, however, work its way out into official relations, which continued friendly, and gradually the talk of boycotting the exposition died out. There is no need of presenting here the grounds for the belief in the innocence of Dreyfus. These have been repeatedly shown in the press, and the above outline of the affair itself is sufficient to indicate them. But a brief summary of the anti-Dreyfusard view may be of service. The speeches of the friends of Dreyfus and the favorable testimony that was given to the court-martial have been quoted at great length, but the case of their opponents has not been presented with any degree of completeness. No doubt there is a good reason for this, apart from the natural sympathy of the foreign press correspondents with the Dreyfusard side, since the very premises of the anti-Dreyfusards seemed to show that the discovery of truth was not their object. In fact, the attitude of many of their most prominent spokesmen was such that all investigation of their side of the case seemed fruitless, since the inquirer was met at the start with the remarkable statement that even if a man knew the truth he ought not to declare it lest it should in some way undermine the foundations of society. It may be that this shifting of the question from the guilt or innocence of Dreyfus to the expediency of telling the truth robbed the anti-Dreyfusard arguments of their seriousness, and made it seem a waste of time to investigate them. If a body of men declare at the outset that a certain decision must be sustained, whether right or wrong, it is natural that it should seem useless to inquire into their arguments. Nevertheless, since many of the most prominent men in France, as well as the great majority of the people, were well pleased with the decision of the Rennes court-martial, it may be of interest to note some of their statements of view on that subject. The prevailing attitude was one of acquiescence in the decision of the court-martial. There was no evidence of any doubt as to the competence or sincerity of the members of the court. Great stress was laid upon the fact that the court had all the information before it which the friends of Dreyfus were able to supply, and that from the legal point of view their judgment was beyond criticism. The forms of justice, according to the French view of it, had been maintained in all respects, and the new evidence which had been developed since the original court-martial of 1894 was all laid before the court. As to the influence upon the members of the court of the generals who appeared before them and denounced Dreyfus in such vehement terms, the anti-Dreyfusards had little to say. They dwelt merely on the fact that the judges were honest men, of good reputation, and came to their decision in a full knowledge of all the facts. The extenuating circumstances which the

court found and which gave the Dreyfusards the chance to say that a doubt of the prisoner's guilt lingered in the minds of the judges was explained by the anti-Dreyfusards as the result merely of a desire to mitigate the rigors of the punishment. How could there be any extenuating circumstances, said the Dreyfusards, for an act of treason committed by a well-to-do and intelligent officer whose prospects were of the best? The verdict should have been either guilty or not guilty, and this qualified sentence indicated doubt in the minds of the judges. To this it was replied that the only way of softening the punishment was to find extenuating circumstances. It was a necessary compromise in view of the character of the law. There have been instances of a verdict of not guilty even when the judge was convinced of the prisoner's guilt on account of the failure of the law to adapt the punishment to the different degrees of guilt. A judge finding the punishment too severe and having no alternative but to pronounce the prisoner guilty or innocent might choose to render the latter sentence in order to spare the prisoner a suffering which was beyond his deserts. Speculating on this point, a French writer asks if the judges at Rennes might not perhaps have taken into consideration how little injury the revelation of the document mentioned in the *bordercau* really caused France. Again it was suggested that the finding of extenuating circumstances was merely a way of expressing the view that Dreyfus had already paid a part of the penalty by his confinement on the Ile du Diable. Since the law did not admit of imposing any heavier penalty than an imprisonment of ten years, it was natural that the court should seek to offset the undue harshness of the sentence in this case by finding extenuating circumstances.

As to the universal condemnation of France by foreign nations, it seemed to some French writers that such an attitude was wholly pharisaical. Each country seemed to thank heaven that it was not like the nation in which this iniquity had triumphed. "We are very far, indeed," says a French writer, "from despising the opinion of the rest of the world, but we do not give up our right of judging this opinion in each case and appraising its just value. It is perfectly true that no other country resembles us, if by that they mean to say that no other country would have tolerated the opening and prolongation of such a trial. It is in France alone, the nation of generous tradition, that this phenomenon has been possible, and that it has been permitted to endure so long." In general, the French retort was that in other countries a similar affair would have been hushed up at once, and therefore could not have excited such general comment. The condemnation of other nations was therefore taken in France as in reality a testimonial to the French nobility of character, to their generous desire to give a condemned man the benefit of the doubt. In no other country, it was said, would a condemned man have had such a chance for vindication. "When another country shall present the spectacle that we have presented, when it shall have sacrificed its repose for several years, when it shall have compromised its most serious interests in order to permit a condemned man to prove a hypothetical innocence, we shall accord to its lessons and its remonstrances the attention which so chivalrous a devotion to justice will have deserved. But where is that country? We look in all directions, but see it nowhere." Nevertheless, the attitude of the other countries toward the Dreyfus affair caused surprise and alarm in France. Some French writers went so far as to say that the consequences of the affair were likely to be more serious in the domain of foreign relations than in that of internal affairs. It was expected that the exposition of 1900 would have a pacifying effect upon all the factions in French politics. On the other hand, the almost universal condemnation of France on the part of foreign countries was regarded very seriously. To Frenchmen, it seemed as if the entire world were prejudiced against them, and there were some who blamed the Dreyfusards and the anti-Dreyfusards alike for the existence of that prejudice. It was said, too, that the foreigner had no business to occupy himself with an affair which did not concern him, and that this tendency to form an unfavorable opinion on the subject was proof of hostility toward France. To this view of the matter a more moderate writer replied that it was natural that foreign nations should be interested in what occurred in France, which, as some said, had been "for so long a time the centre of the civilized world." And as to any benevolence on the part of any foreign nation, this view was dismissed as absurd. It was pointed out that the Dreyfus affair had greatly surpassed in interest all other *causes célèbres*, and might well rouse interest quite apart from any feeling of hostility toward France. That this interest in the case had resulted in a general unfavorable view of the conduct of the French people could not be denied. Russia, the ally of France, had shown it no less than Germany and England. Catholic countries like Spain and the South American republics, neutral countries like Catholic Belgium and Protestant Switzerland, all had given evidence of the same opinion on the affair. Even among the Moslem and anti-Semite population of the Nile Valley the Dreyfusards were numerous, and a Moslem journal of Egypt had declared in favor of the cause of Dreyfus. In these

facts the moderate publicists could see no evidence of an unreasoning hostility to France, and they accounted for them as resulting from a lack of information on the subject. "Under these conditions," says a French writer, "why should we be astonished that a cry of amazement and disgust should be raised against us everywhere at the news that the Rennes court-martial had condemned Dreyfus? They have seen in this verdict a deliberate act of injustice; they have devoted the court-martial itself to infamy, and, what is more serious and at the same time supremely unjust, they have identified all France with this court-martial and have covered it with obloquy. This is the terrible situation, a situation the more lamentable that, admitting the anti-Dreyfusard theory that the opinion of foreigners has been created by artificial means, this opinion is none the less sincere. Affairs having come to this point it was inevitable that this situation should be made use of by our real enemies in order to poison the mind of the world against us and raise difficulties in our path. A certain portion of the press, with the *Times* at its head, has not failed to do this and has started a veritable campaign to boycott not only the exposition of 1900, but all France and everything that is French. These efforts have not produced the immediate result that was expected, since the exposition will not be boycotted, but this is only a detail. The serious fact remains that unfavorable opinion toward us has increased, so all our efforts must be put forth in the first place to render this opinion more favorable to us, and, in the second place, to avoid everything in future that can discredit us anew. Let the Dreyfusards and the anti-Dreyfusards set themselves to work and in a noble spirit of rivalry repair the evil which each faction accuses the other of having committed."

II. INTERNAL POLITICS.

The Presidency.—The death of President Faure (*q. v.*) occurred on February 16, and in accordance with the constitutional requirement for the immediate filling of the vacancy there was a joint session of senate and chamber as a National Assembly at Versailles on February 18. M. Loubet (*q. v.*), the unanimous choice of the Republican groups in the senate, was chosen by the assembly on a single ballot by 483 votes as against 279 cast for M. Méline and 54 divided among Cavaignac, Deschanel, Dupuy, and others. The message of the new president was read in parliament on February 22. It defined the objects of his policy as tolerance and harmony, and declared the necessity of showing equal respect to each of the elements in the state—to the chamber, the magistracy, and the national army. The president further asserted his intention to suffer no diminution of his constitutional rights in the execution of his duties. The choice of M. Loubet was taken as a sign of a more compromising spirit toward the Dreyfus affair. M. Méline's devotion to the interests of the army and his determined opposition to revision did not suffice to carry his election.

Nationalist Agitation.—M. Déroulède (*q. v.*), the president of the League of Patriots, together with other Nationalists and anti-Dreyfusards, stirred up a tumult on the streets after the session of the National Assembly with the absurd idea of preparing the way for a *coup d'état*. Nothing came of this, and the rioters made another attempt on the occasion of President Faure's funeral, February 23. When the troops were returning from the ceremonies M. Déroulède, who was accompanied by the national deputy Marcel-Habert and other members of the League of Patriots, seized the bridle of General Roget's horse and summoned him to lead his troops to the Elysées. The only result of this was the arrest of some four hundred agitators, Déroulède and Marcel-Habert among them, and their prosecution as disturbers of the peace. M. Déroulède declared that his purpose was to replace the parliamentary by the plebiscitary republic. The headquarters of the League of Patriots and other leagues that had shown hostility toward the government were searched and papers were said to have been found that would serve as a basis for a prosecution of Nationalist and Royalist conspirators. The government, however, apparently thinking it unwise to take the affair too seriously, did not show much activity in the matter. Déroulède and Marcel-Habert were brought to trial on May 31 and both acquitted. Efforts to repress the anti-Semitic agitation had already been made. M. Max Régis, the notorious anti-Semite, who had been elected mayor of Algiers, was removed from office on January 9, and on April 15 was condemned to four months' imprisonment for libelling the governor.

The Return of Marchand.—Major Marchand landed at Toulon on May 30, and on June 1 made his entry into Paris, where he was received with the greatest enthusiasm. This was a tribute to the man's personal heroism rather than to the political value of his achievements. Many Frenchmen, in fact, felt that the Fashoda affair was most discreditable. The very day on which Marchand landed at Toulon the senate accepted the convention which regulated the question of the Upper Nile, and in so doing definitely abandoned what had been the chief object of the Marchand expedition. The occasion brought forth a debate, in the course of which the govern-

ment was sharply criticised for its diplomatic policy during the Fashoda crisis. M. Delcassé said in reply that the government had accomplished all that could have been expected in the circumstances and had gained some real advantages. The only legitimate objection to the convention was that the commercial clauses favored English commerce at the expense of the French. This was the invariable effect of reciprocity, since when the French had conquered and organized colonies it was their English rivals who commonly developed their trade. This, however, was not the fault of the government, but of the commercial classes of France, who lacked the enterprise shown by the corresponding classes in England. In spite of the enthusiasm over Marchand, French writers continued to regard the Fashoda policy as an unpardonable mistake. It seemed to them an unnecessary humiliation, and that no government in the circumstances should have made the attempt.

Ministerial Crisis.—The decision of the Court of Cassation in favor of revision was generally received with approval, but among certain excitable Royalist and Nationalist groups there was much resentment over what was said to be an attack upon the honor of the army. This led to a disgraceful riot at the Auteuil race-course on June 4, when the members of certain Royalist clubs, who were said to have been instigated by the League of Patriots, made a rush for the reviewing stand, where the president was seated, and amid a great uproar attempted a personal assault. One of them struck the president's hat with his cane. He was arrested along with others who were concerned in the outrage, and a number of the clubs were closed. During the next week there was much apprehension lest a similar or even worse riot should break out on the occasion of the *Grand Prix de Paris*, to occur on June 11. This is one of the most important social events of the year, and it is customary for the president of the republic to attend in person. Precautions were taken for putting down any disorder, but the day passed without any serious disturbances. In one of the cafés, however, there was some disorder, and the police were said to have used violence in putting it down. On the following day one of the deputies interpellated the government "upon the violence of the police against the Republicans." The ministry defended the police from the charge, holding that they had done no more than their duty at a critical time. A sharp discussion followed, and finally the government submitted the question of confidence. It was defeated by a vote of 253 to 246, and the other motion before the chamber was passed to the effect that the chamber was resolved to support no government that was not determined to defend with energy republican institutions and to assure public safety. Thereupon the ministry resigned. M. Poincaré having failed to form a ministry, M. Waldeck-Rousseau was designated, and on June 23 the new ministry was announced. It consisted of M. Waldeck-Rousseau, president of the council and minister of the interior; M. Delcassé, who still retained the portfolio of foreign affairs; M. Decrais, the colonies; M. Millerand, commerce; M. de Lanessan, marine; M. Baudin, public works; M. Leygues, public instruction; M. Monis, justice; M. Caillaux, finance; M. Dupuy, agriculture, and General de Galliffet, war. The cabinet represented a great diversity of views. M. Millerand was the chief of the Socialist party in the chamber of deputies, and M. Baudin was also a Socialist. General de Galliffet, on the other hand, was the officer who exercised such severity in suppressing the Commune. The others represented varying shades of political opinion. The composition of the cabinet seemed to indicate the triumph of the revisionists and a general desire to see that justice was done in the Dreyfus affair. For an account of the comments which the presence of MM. Millerand and Baudin, the Socialist leaders, occasioned see the article *SOCIALISM*. On June 26 the ministry declared that the object of its policy was to put an end to the agitation against the republic, to demand faithful service from all departments of the administration, and to fulfil its duties with courage.

Nationalist and Royalist Plots.—M. Déroulède and Marcel-Habert continued their agitation after their release. Evidences were found of the existence of a plot against the republic, and the government's investigation implicated many of the Royalist and Imperialist groups, as well as the League of Patriots and the Anti-Semite League. MM. Déroulède and Marcel-Habert were arrested among others. On September 18 the senate assembled as a High Court to try the conspirators. Reference was made in the indictment to a widespread Royalist plot, in which the Duke of Orleans was concerned, and whose aim was by means of street riots to subvert the existing government. In connection with this agitation occurred the remarkable Guérin incident at the Rue Chabrol. M. Guérin, president of the Anti-Semite League, with several companions, fortified themselves at the headquarters of the league in the Rue Chabrol, and there for several weeks they defied the government, though, to be sure, no serious attempt was made to capture them. The police and the military blockaded the street to prevent their escape, and the siege, as it was called, lasted a month before the occupants of the house surrendered. The only affair connected with this incident that seemed at all serious was the attack upon

a number of churches by a mob of Anarchists and Socialists. The plundering of the Church of St. Joseph led to some fighting and the injury of a large number of persons. It was followed by many arrests. Toward the close of the year the conspiracy trials were going on in the senate in its capacity of High Court. On November 18 M. Déroulède was condemned to three months' imprisonment on the charge of insulting the president of the republic. On December 20, having again attacked the president and senators in the course of a violent harangue, he was condemned to two years' imprisonment. Out of the large number of persons arrested very few were convicted. Finally there remained only six accused. The High Court condemned four of these, urging, however, extenuating circumstances. M. Déroulède and two others were condemned to ten years' banishment, and M. Guérin to ten years' detention.

III. FOREIGN AFFAIRS.

Commercial Convention with Italy.—At the close of the year 1898 the French chamber voted by a large majority a commercial convention with Italy. It was taken as a sign of a desire on the part of both nations to maintain friendly relations in commercial affairs. The Italian chamber of deputies also voted the measure by a large majority on the 28th of January. A closer political *rapprochement* was expected to result from this commercial agreement.

France and England—Madagascar Question.—On January 6 the British government issued a blue book containing the diplomatic correspondence between England and France on the subject of the administration of Madagascar. By the treaty of 1865, which was confirmed in 1890, France granted certain privileges in return for England's recognition of the French protectorate over the island. The following were the chief grievances of which Great Britain complained: (1) France had violated her engagement in the convention of 1890 by imposing high duties upon English goods. The convention of 1890 had declared that the French protectorate of Madagascar would not injure the rights and privileges of the English subjects, one of these privileges being that the duty on English merchandise should not exceed 10 per cent. *ad valorem*. The duties levied by France were said to be much higher than this. (2) The government of Madagascar had further injured English commerce by preventing the natives, through intimidation, from purchasing English goods. (3) France had imposed restrictions on the commerce of Indian subjects in Madagascar. (4) Grave injury had been done to English interests by a colonial decree in 1898, forbidding the coasting trade, except in French bottoms, after January 1, 1899. The last-named grievance was recognized by the French government as real, and the decree was rescinded very promptly upon the demand of the British government. The tone of the comment in the British press was taken in France as indicating a desire to force a quarrel, but a more friendly spirit was soon evinced on both sides of the channel. The French government showed a readiness to redress the other grievances if they proved to be real. The affair aroused much ill-considered criticism in the press of the two countries. In England reference was made to the French policy of "pin pricks." In France, England was accused of exclusiveness in her own colonial policy, and some French writers argued that the only reason why Great Britain was not oftener attacked on this ground was that she followed a more shifty policy, her persecution of the foreign trader being carried on by clandestine or indirect means.

Muscat Affair.—This incident, though unimportant in itself, was the temporary cause of friction between France and Great Britain. The French government had obtained from the Sultan of Oman, whose territories lie at the southeastern extremity of Arabia, the lease of a port near Muscat. The British government of India, in order to neutralize the French advantage and prevent this port from becoming a French naval station, sent a squadron there and forced the Sultan, under the threat of a bombardment of the capital, to annul the French cession. By a treaty concluded in 1862 the French and English had engaged to respect the integrity of the Sultan's territories, and by an agreement between the Sultan and the British government of India in 1891 the former, in return for an annual subsidy, had promised that he would not alienate any of his territories. In the British Parliament it was argued that both the Sultan and the French government had broken their pledges. According to the French official version, however, the controversy was due to a misunderstanding. All that the French had obtained from the Sultan was the use of the port as a coaling station, and the two powers were practically on an equal footing. Either the French agent at Muscat had exceeded his instructions in asking for more than a coaling station or else the English agent had been misled as to the advantages which France had obtained. On March 6, 1899, M. Delcassé said in the chamber of deputies that France had asked only for a coaling station. The resort of the British government of India to a display of force in threatening the Sultan with a bombardment caused offence in France, but M. Delcassé afterward announced that the British

government had disavowed the action of the Indian viceroy and had expressed its regret. This was held to be sufficient in France, and the incident was regarded as closed. But for some time the comment in the French press showed a touch of mortification that England should have scored a point against France, and some complained that the French government was giving Great Britain too many chances for easy diplomatic victories. This irritation was aggravated later by the failure of the French government to carry out its policy in Shanghai, where since 1853 France had possessed a strip of land lying near the city. The French wished to extend their narrow limits, but the British, some of whom claimed property rights which such an extension would disregard, opposed this policy and prevented it from being carried out.

The Upper Nile.—The settlement of the Fashoda difficulty by the withdrawal of France from her claim to Fashoda left the question of the Upper Nile to be adjusted. This involved the delimitation of the French Congo and of the Bahr-el-Ghazal, a dependency of the Soudan. The desire of France was to obtain an outlet on the Nile, or at least to secure an open way for her commerce on that river. Nothing definite was stated upon the meeting of the British Parliament, but the hope was expressed that arrangements would be made to insure peaceful settlement of these questions by the two countries. A French writer gives the following résumé of the question: The influence of Egypt did not begin to make itself felt in the Upper Nile until after 1841. At that time an Egyptian expedition ascended the Nile nearly as far as the 5th parallel, and the entire region was opened to European and native commerce. It was not until 1889, however, that the Khedive, Ismail Pasha, had annexed the Upper Nile region to Egypt. Samuel Baker, to whom this commission was entrusted, established three posts on the Upper Nile, but the real organizer of Egyptian control over these vast territories was Gordon, who succeeded Baker in 1874 with the title of governor-general of the Egyptian Equatorial Provinces. He established posts throughout the country as far as the frontier of Uganda, and all along the course of the Nile, and of the Sobat and other affluents from the east and also in the Bahr-el-Ghazal. His successor, Emin Pasha, later added other posts to those established by Gordon, both on the eastern and western sides of the Nile, and in 1881 fixed the limits of the Equatorial Provinces. Egypt not only extended its authority over the countries in the neighborhood of the White Nile, but over those traversed by the most westerly affluents of the Bahr-el-Ghazal and the Darfur. An Egyptian trader, named Ziber, secured great influence in the Bahr-el-Ghazal, and finally became its ruler under the authority of the Egyptian government. Thus a new province of Bahr-el-Ghazal was established next to Equatoria, with its capital at Dem-Ziber. Ziber was succeeded by Lupton Bey, who was governor of both Darfur and Bahr-el-Ghazal, and later brought under his authority all the country as far as the valley of the Nile, and he extended his sway even into the basin of the Chinko, an affluent of the Ubangi. The question to be answered in 1899 was how far the Egyptian sphere of influence extended in the direction of the Bahr-el-Ghazal before the Mahdist insurrection. This control was not only exercised over the entire left bank of the Nile, but over the upper basin of the Wella, the Mbomu and the Chinko—that is to say, over the southern part of the Congo Basin. As a matter of fact, Egyptian influence extended as far as the 4th parallel in the region of the Upper Congo. The decision of the convention of Berlin recognized as the southern limit of the Egyptian possessions the 4th parallel, making the Belgian Congo and French Congo contiguous to the Egyptian Soudan.

Anglo-French Convention.—The long-continued conflict between Great Britain and France over the limits of their respective claims in the region of the Upper Nile came to an end with the conclusion of an agreement on March 21, 1899. This agreement dealt not only with the question of the Upper Nile, but with the mutual boundaries of the French and English possessions in West Africa. It will be remembered that by the convention of June 14, 1898, the boundary separating Nigeria from the French Sahara was definitely laid down, while that defining the basin of the Tchad, especially in the east, in the direction of the Nile, was left unsettled. The text of the convention of March 21 is as follows:

"The undersigned, duly authorized for this purpose by their governments, have signed the following declaration:

"Article IV. Convention of June 14, 1898, is completed by the following propositions, which shall be considered as forming an integral part of it:

"(1) The government of the French Republic engages not to acquire either territory or political influence to the east of the line of the frontier defined in the paragraph following, and the government of her Britannic Majesty engages not to acquire either territory or political influence to the west of this same line.

"(2) The line of the frontier shall start from the point where the boundary between the Congo Free State and the French territory meets the line passing be-

tween the watershed of the Nile and the watershed of the Congo and its affluents. It shall follow in principle this line of water-parting up to its intersection with the 11th parallel of north latitude. From this point it shall be traced as far as the 15th parallel in such manner as to separate in principle the kingdom of Wadai from what constituted the province of Darfur in 1882; but which shall in no case be drawn so as to pass westward of the 21° of longitude east of Greenwich (18° 40' east of Paris), or to the eastward of the 23° of longitude east of Greenwich (20° 40' east of Paris).

"(3) It is understood in principle that to the north of the 15th parallel the French zone shall be limited to the northeast, and to the east by a line which shall start from the point of intersection of the Tropic of Cancer, with the 16° of longitude east of Greenwich (13° 40' east of Paris), shall descend in a southeastern direction until it meets the 24° of longitude east of Greenwich (21° 40' east of Paris), and shall then follow the 24° until it meets to the north of the 15th parallel of latitude the frontier of Darfur as it shall finally be fixed.

"(4) The two governments engage to appoint commissioners who shall be charged with the laying down of a frontier line conforming to the indications given in the second paragraph of the present declaration. The result of their work shall be submitted to the approval of their respective governments.

"It is agreed that the provisions of Article IX. of the convention of June 14, 1898, shall apply equally to the territories lying to the south of latitude 14° 20' north, and to the north of the 5° of north latitude between 14° 20' longitude east of Greenwich (12° east of Paris) and the course of the Upper Nile."

Despite the efforts of a portion of the French press to see in this convention a triumph for French diplomacy, it was acknowledged by well-informed French writers that their government had met with a check in its Fashoda policy. At the same time the adjustment in West Africa was regarded as favorable to France. The general line of demarcation described in paragraphs 2 and 3 separates the basin of the Nile from that of the Congo and the Tchad and defines the boundaries of the desert regions belonging to the two powers. It places the Libyan desert within the British domain. It leaves France in possession of the basin of Lake Tchad and Great Britain in possession of the valley of the Upper Nile as far as the 15th parallel. The agreement was taken by some as barring France in future from disputing British domination in Egypt, but this view encountered the objection that the line of demarcation, to the east of which France agreed not to acquire territory or political influence, extended north only so far as the southern boundary of Tripoli and did not affect Egypt at all. It was further said that if the Egyptian question came up in a practical form and the Khedive asserted his right to the Soudan, France would in no wise be prevented by these engagements from supporting his claims, since she would not be trying to extend her influence over Soudanese territory, but merely aiding another power in maintaining its rights. This view of the matter is important only as showing the efforts of the French press to find consolation for what was considered a diplomatic misfortune. The commercial clause is important. It extends the principle of equal treatment to the trade of each nation in the region lying between the Tchad and the Upper Nile. The French government, in notifying the public of the March convention, said that it had attained the object for which Marchand's Fashoda expedition had been undertaken—namely, to supply the French possessions on the Upper Ubangi with an outlet on the Nile. Another point in which the French found some satisfaction with this agreement was the alleged value of the territories attributed to the respective powers. It was said that the Bahr-el-Ghazal, which France had desired, but which England had gained, was of doubtful value, being infertile, marshy, and unhealthy—facts that had been sufficiently established by the Marchand expedition; that Darfur, which also was included in the English sphere, was hardly more valuable, and had furthermore been devastated by civil wars for several years. On the other hand the territories recognized as French were valuable acquisitions, especially Kanem, Wadai, and Baghirmi, and the French portion of the desert region comprised several valuable oases. Nevertheless the settlement was received with some chagrin in France. It was recognized that material interests had not been sacrificed, but political prestige was thought to have suffered greatly. It was said that the French government had receded from its position in the matter of Fashoda in the face of a threat of war, and it was blamed for the inconsiderate policy that had led it into a situation from which it could not escape without humiliation. In withdrawing from Fashoda the government had admitted a diplomatic defeat, but the convention of March had practically gained for France all that she could expect in the circumstances. This agreement was the more readily reached that it concerned itself only with the definition of the boundary on the Upper Nile and did not touch on the questions of Madagascar or Muscat (discussed above), or on that of the French shore, an account of which will be found in the article NEWFOUNDLAND.

Relations with Germany and Russia.—The exchange of courtesies between France

and Germany in July and between France and Russia in August occasioned much comment in the press as indicating a possible change in the general European situation. The German Emperor, William II., having entered the port of Bergen, Norway, paid a visit on July 6, 1899, to the officers of a French school-ship, whom he afterward invited on board his yacht. The Emperor sought to give the occasion the character of a friendly Franco-German meeting, and sent a cordial telegraphic message to the president of the French Republic. A similar exchange of courtesies followed at Geestmünde, where the officers of a French despatch-boat fraternized with officers of the German marine. There was much talk of a Franco-German *rapprochement* as a result of these meetings. Some held that these incidents marked the renunciation of the long-standing French ambition in regard to Alsace-Lorraine; others saw in them a menace to the Franco-Russian alliance, and still others regarded them as a sign of a European coalition to check the aggressive colonial policy of Great Britain. A good deal was said about the avenging of Fashoda, the liberation of Egypt, the transfer of South Africa to Germany and of India to Russia. But these international courtesies did not necessarily involve any general change of policy. They indicated rather an intention so far as possible to promote international peace. On August 4 the French minister of foreign affairs, M. Delcassé, paid a visit to St. Petersburg, where he was received with every mark of consideration by the Czar. Much the same sort of comment followed in the European press, especially in England, where the fear of a joint action on the part of France and Russia against that country was repeatedly expressed. A good deal was made of the return visit paid by Count Muravieff to France, which coincided with a number of very important events in international politics, of which the most recent was the war between England and the Transvaal. The situation was described in a semi-official note, which was communicated to the Russian press in the following form: "Although the sojourn at Paris of Count Muravieff did not have an official character, the Russian minister has had long and frequent interviews with the chief of the state and the French minister of foreign affairs—interviews which have permitted the representatives of both these friendly and allied nations to exchange ideas upon actual events. The friendship and intimacy now established between Count Muravieff and M. Delcassé will increase and will facilitate joint action in the interest of both countries."

No such aggressive motive, however, seemed to be at the basis of these visits, which were merely a sign that the Franco-Russian alliance, already known to exist, was still in force. The visit of M. Delcassé was plausibly interpreted by some as an assurance to Russia that the recent amenities which had passed between Germany and France had not altered the attitude of the latter country toward the northern power. It could not properly be construed as a menace to European peace. Perhaps the strongest guarantee of peace is the commercial interests of the great powers. It has been estimated that of the total produce and manufactures exported by the five great European powers England purchases about 28 per cent., and that England and her colonies alone buy each year from Germany almost as much as the other four great powers put together. It is further estimated that France sells more than twice as much to the United Kingdom as she sells to the other great powers, and that Great Britain buys more from the dual alliance and triple alliance than these alliances purchase from each other. From these and similar considerations it is urged that no advantage to be gained by the partition of the British colonies could begin to make up for the loss of wealth through the destruction of the British market. The main interest of the powers being more and more industrial as the years pass, the hope has been expressed that war will be avoided by every possible means and that an aggressive policy on the part of the powers toward Great Britain and her colonies is improbable.

Effects of French Foreign Policy.—In the latter part of November M. Delcassé reviewed in the chamber of deputies the course of the government during the year in its dealing with foreign affairs. His speech affords a good summary of the course of the French foreign policy. In the first place, in respect to China, there had been a serious difficulty in defining the boundaries of the French cession on the Bay of Quang-Tcheou-Wan on the Gulf of Tonquin. The French and Chinese commissioners could not agree, the surrounding country was thrown into a state of disorder, and two French officers were assassinated. Thereupon the French government immediately demanded satisfaction, and especially the punishment of the guilty parties. The Chinese government, finding itself in a difficult position, promised that there should be no more obstacles to the delimitation of the French territory. In M. Delcassé's review of these events he claimed that France compared favorably with other powers in respect to her influence in the East. Not only had she gained important concessions, but her moral position was strengthened by her protectorate over the Catholics. Another advantage to her was the protection of her Indo-Chinese boundaries by the promise of the Chinese government that it would not alienate any portion of its southern provinces to a foreign power. The Chinese policy of the French government was in favor of the "open door," and thus in ac-

cord with that of England and the United States. As to Africa, M. Delcassé declared that the Anglo-French convention had strengthened the French empire in Africa by giving it unity, and he held that the proper object of French policy henceforth was to strengthen their colonies within their existing borders and not to reach out for more territory. He cited as other advantages of the French policy the establishment of commercial harmony between France and the United States; the strengthening of the Franco-Russian alliance, as illustrated by the mutual visits of the French and Russian ministers, and the honorable part which France had played in The Hague conference. The attitude of the minister of foreign affairs toward the war between England and the Transvaal was the chief matter of debate during the discussion on the budget of the ministry of foreign affairs. A large part of the French press favored a distinctly hostile policy toward England. They took the position that France had been humiliated as a result of the recent foreign policy of the government and that her interests were neglected by the ministry. They favored a general coalition against England. While an adoption of this course would no doubt have been popular and to some extent removed the painful impression left by the Fashoda incident, M. Delcassé refused to allow the policy of the government to be swayed by the prevailing Anglophobia, and distinctly opposed any policy of interference with the South African conflict.

The Embassy at the Vatican.—An important subject that came up during the discussion of the budget of foreign affairs was the question of maintaining an embassy at the Vatican. The commission of the budget had suppressed that embassy on the ground of expense, and it had also cut down certain appropriations that had been made for foreign missions. M. Delcassé insisted upon the necessity of maintaining the embassy at the Vatican, and used his influence for restoring the former appropriations to the missions. In these measures he had the support of the left and the extreme left, but was opposed by the right and the Nationalists. He was finally successful. The opposition held that the French embassy to the Vatican was useless and that it should be abolished from economic considerations which alone should determine the policy of states. It was urged, too, that the Vatican was hostile to the government. On the other hand, it was said that the representation of France at the Vatican was all the more valuable if the relations were not cordial, since its presence there tended to maintain harmony at home and to placate the clerical interest. The appropriations for the missions were defended on the ground that the missionaries, wholly apart from their religious work, had rendered great services of an economic and commercial character to French interests in the East.

Colonial Policy.—There were signs in 1899, especially toward the close of the year, that the French colonial policy was varying toward commercial and economic development of the colonies already possessed instead of an aggressive attitude in respect to the acquisition of new lands. Members of the government emphasized the necessity of developing the French colonies, and deprecated the spirit of certain patriots, who, by referring to the alleged humiliation of France in the Fashoda affair, were always urging the government to gain more territory and to take an active part in the rivalry of colonial acquisitions. The war in South Africa drew the public attention sharply to the need of submarine cables under French control. It was pointed out that the telegraphic communications between France and her colonies, with the exception of Algeria and Tunis, were in the hands of foreign countries. It was even said that the important colonies of Indo-China and Madagascar might be attacked by a foreign foe and be occupied by the military force for fifteen or twenty days without any knowledge of the fact reaching the French government. The need of improving French submarine telegraphic communication had been appreciated for many years past, but was brought to public notice in an urgent manner by the events in South Africa, which illustrated the effective control on the part of England over the submarine cables of the African continent. The fact that news from the seat of war came exclusively over lines in the hands of the British authorities demonstrated the importance of this matter in a very striking manner. Among the submarine cables proposed in France were first a line to connect France with the Senegal; second, a network of lines in the Indian Ocean establishing an independent line with Europe and with Madagascar and other dependencies; third, a system in the Far East between Cochin-China and Tonquin. Other less important proposals were for French lines on the coast of western Africa to join the French possessions of the coast with the Senegal; a line connecting Indo-China with Djibouti, and joining the network in the Indian Ocean which touched Madagascar; and finally a number of projects for lines in the Pacific. See **FRENCH SOUDAN**.

FRANKLAND, Sir EDWARD, foreign secretary of the British Royal Society, died August 13, 1899. He was born near Lancaster, January 18, 1825; was educated at the Royal School of Mines, London, and at Marburg, Giessen, and other German universities. During this time he came under the instruction of Playfair, Bunsen, and Liebig. His thesis submitted upon taking his degree at Marburg in 1849 stated his discovery of a method of isolating ethyl, the essential radical of alcohol and ether. He returned to England, and was professor of chemistry at Owen's College, Man-

chester, from 1851 to 1857. From the latter year to 1863 he was a lecturer at St. Bartholomew's Hospital, London, and for the next four years at the Royal Institution. He also lectured at the Royal School of Mines from 1865 to 1885. He served from 1868 to 1874 on a commission appointed to investigate the pollution of rivers and the domestic water-supply. Upon this subject he submitted exhaustive reports by reason of which the London water-supply was greatly improved. In 1871-72 he was president of the Chemical Society. Sir Edward had received the degrees of Ph.D., D.C.L., LL.D., and M.D., and in 1897 he was created a K.C.B. Among his publications are: *Lecture Notes for Chemical Students; Water Analysis; Experimental Researches in Pure, Applied, and Physical Chemistry; How to Teach Chemistry.*

FRATERNAL ORGANIZATIONS. According to the latest available statistics (December 31, 1898), there were in this country nearly 2,600,000 members of fraternal orders, and \$3,400,000,000 worth of benefit certificates in force issued by such orders. The germ of American insurance brotherhoods was in the transplanted English friendly societies, of which the Independent Order of Odd Fellows (introduced into the United States eighty years ago), the Ancient Order of Foresters (thirty-five years ago), and the United Ancient Order of Druids (sixty-five years ago), are the most important. In 1868 John Gordon Upchurch, a Freemason, founded at Meadville, Penn., the Ancient Order of United Workmen, a secret beneficiary society, designed to pay stipulated sums to the surviving relatives of members at the deaths of the latter by means of assessments paid by surviving members. This organization remains to-day practically the parent of all similar secret societies, of which there are perhaps 200, conducted on what is called the "lodge system," whose rise and development have taken place within the last thirty years, and more than one-half of which may be characterized as fairly successful.

The system of assessment assurance originally adopted was naturally crude, among other things including the payment of \$2000 insurance at the death of a member by means of a uniform assessment of \$1 per capita. Experience soon made plain, however, the necessity for a system of assessments which should take cognizance of increasing age of members; hence, the step-rate system of assessment was instituted, in which the rate, instead of remaining uniform during the life of a member, increases gradually by periods of years. The next step, in which 76 out of 87 of the more important of these organizations joined, was a system by which assessments are graded according to age at joining, and it is pointed out as significant that two of the more prominent societies have gone still farther and are making assessments which increase annually, according to the age of the member, in this way accumulating sums due surviving relatives of deceased members. As a general rule, the best types among the fraternal orders confine themselves to paying death benefits, although there are many which furnish partial, total, or permanent disability benefits, in some instances a funeral, a burial plot, and a monument benefit; benefits designed to cover accidents, and which will apply only in extreme old age; a medical attendance benefit, and, in the case of secret labor organizations which have mutual beneficiary features, a strike benefit, collected and distributed, of course, practically as similar funds are handled by straight-out trades unions.

The subjoined list includes the more prominent fraternal organizations, with the more important statistics and name and address of the secretary, so far as obtainable.

FRATERNITIES, COLLEGE, OR GREEK-LETTER SOCIETIES, are peculiarly an American institution, having no counterpart in the student societies of foreign universities or colleges. They differ from all other American secret societies also, and social and educational qualities play an important part in their organization. There are over two score important ones and nearly as many more which are less known. The Greek-letter fraternity is supposed to have sprung indirectly from Freemasonry, but it is widely different from that order. The first society, Phi Beta Kappa, was founded in 1776 at William and Mary College, whence it spread to Yale, Harvard, and other institutions, becoming finally a college honorary society. The modern college fraternity has risen since the first quarter of the century, and has lost its early literary tendency and become almost a purely social body. Its influence on the undergraduate life, however, is often very great, and the antagonism of college authorities toward it is fast giving way to an opposite tendency. The chapter houses or lodges, as they are sometimes modestly called, are frequently of great beauty, and in many institutions serve as halls of residence as well as common meeting ground for the members. Two criticisms aimed at the Greek-letter societies are, first, their tendency to produce cliques among the students, which in turn destroys college spirit; and, second, the danger of their fostering false aristocratic ideas and habits of extravagance. At the large universities the spirit of cliquishness is disappearing before the broader student life which generally exists, and at the smaller colleges the evil is said to be overestimated. In most cases it is probably counterbalanced by the advantages of fraternity life, such as social training and the formation of close friendships. As to the second objection, it may be said that the aggregate value of fraternity holdings is in the millions, being at one university alone over three-quarters of a million dollars. The financial policy of the chapters is generally in the hands of alumni, however, and the burden on the undergraduate is not very great outside his regular dues. It is the testimony of fraternity men that society members are not, on the whole, more extravagant than other college men, and while the wealthier students are naturally sometimes in the majority, no student is ever barred from a good chapter on account of money considerations. Princeton is the only one of the larger colleges which has no secret fraternities. These were abolished by the faculty some years ago. At Yale and Harvard the societies are generally in the form of clubs or of class societies, and while membership therein is highly prized, the chapters are not closely affiliated in all cases with the main organizations. There is not space to mention all the college fraternities, but some of the more important general societies are placed in tabular form below, the statistics for 1898, the latest obtainable, being taken from Baird's *American College Fraternities*. They are named in the general order of their founding. Few new fraternities have been formed in recent years.

Fraternity.	Members.	Active Chapters.
Kappa Alpha.....	1,395	4
Sigma Phi.....	2,190	7

Kappa Alpha (Southern).....	3,855	26
Kappa Sigma.....	3,466	23
Pi Kappa Alpha.....	1,061	4
Sigma Nu.....	2,864	20

These figures are only approximate, but are interesting for purposes of comparison. It is the policy of some fraternities to limit the number of chapters or the membership of each chapter, so that the figures do not indicate their relative popularity. Besides other general fraternities, there are the honorary Greek-letter organizations. The well-known key of Phi Beta Kappa is a highly prized trophy, and is worn by many of the most prominent men of the country who have graduated from college courses. The Sigma Xi key, a more recent honor, is taking a similar place in the scientific courses. There are various professional school fraternities, such as Delta Chi and Phi Delta Phi, in law, and some of the Sheffield Scientific School societies are professional chapters of general fraternities. Finally there are the women's fraternities, or, more properly, sororities, including Alpha Phi, Delta Delta Delta, Delta Gamma, Gamma Phi Beta, Kappa Alpha Theta, Kappa Kappa Gamma, and Pi Beta Phi. There are also many local fraternities of no particular note outside their particular colleges.

FREE BAPTIST YOUNG PEOPLE, UNITED SOCIETY OF, organized in 1888, had in 1899 a membership, including junior and intermediate societies, of 25,000; supports seven missionaries in India, besides contributing to several home missions. General meeting for 1900 at Lewiston, Me., July 5-8. President, E. P. Metcalf, Providence, R. I.; secretary, Harry S. Myers, Hillsdale, Mich.

FREEMASONS reported for 1899 as follows, in the United States and British America: Whole number of members, 836,549; raised, 43,542; admissions and restorations, 20,473; withdrawals, 16,889; expulsions and suspensions, 669; suspensions for non-payment of dues, 19,122; deaths, 12,542. Gain in membership over preceding year, 19,322.

FRENCH CONGO AND GABOON, with an area of nearly half a million square miles and a native population of about 5,000,000, is one of the largest colonial possessions of France. It fronts on the Atlantic Ocean and the Gulf of Guinea, and occupies the northern banks of the Congo and its tributary, the Ubangi, thus extending to the very heart of the continent. It is separated from the French possessions north of the Gulf of Guinea by the intervening territories of British Nigeria and German Cameroon, but it circles in a northerly direction around Cameroon, until it meets the French Soudan at Lake Tchad and at Wadai. Thus the French territory stretches continuously from the Congo River northwardly through French Congo, the Soudan, the Sahara, and Algeria, to the Mediterranean Sea. France has had also in mind a general policy looking toward the extension of her territory eastwardly across the continent to connect, perhaps, with her possession French Somaliland, at the entrance to the Red Sea. French Congo already stretches half way across Africa, its eastern borders containing the sources of a large number of the tributaries of the Upper Nile. In the pathway thence to the Red Sea lies Fashoda, where, in 1898, Major Marchand, in attempting to carry out the French policy by his march via the Congo toward the White Nile region, was checked by Great Britain. France made the claim that Egypt had been driven out of the Soudan, and that the territory remained unclaimed, but Great Britain, as adviser to Egypt, compelled France to recognize Egyptian rights as still existent over the Soudan. The affair resulted in the definite settlement of an eastern boundary for French territory, and checked for a time at least the ambitions of France toward gaining a further foothold in East Africa. She obtained, however, an equal commercial footing on the Nile. See **FRANCE** (paragraphs on History). The products of French Congo include a number

of important articles of export, among which, in 1897, were caoutchouc 518 tons, elephant's teeth 105 tons, palm oil 140 tons, palm kernels 806 tons, ebony 1748 tons, mahogany 3421 tons, and coffee, cocoa, ivory, gum opal, and redwood.

FRENCH GUIANA, a dependency of the French republic, lying to the east of Dutch Guiana on the northeast coast of South America, has, exclusive of a few tribes of Indians living in the mountains, an estimated population of 22,714, and an area of about 46,850 square miles. A part of this territory is claimed by Brazil, and the question has been submitted to arbitration. In accordance with a treaty signed August 15, 1897, the French and Brazilian governments on December 6, 1899, selected the Swiss government as arbitrator. The documents of the case are voluminous; the statement of Brazil comprises four volumes and an atlas, and the reply of France includes one volume and three maps. A comparatively early decision was expected. The capital of the colony is Cayenne, situated on the island of the same name, lying off the coast; the population of the city is about 12,350. The colony is represented by one deputy at Paris; it is administered by a governor, who is assisted by a council-general and by municipal councils. Parts of the country are used as French penal colonies, and the inmates of the prisons and the liberated convicts number about 4500. Production and trade are of small importance. In 1897 the exports to France amounted to 1,648,847 francs, and the imports from France amounted to 10,849,482 francs. The gold export in 1896 was 101,938 ounces, of which about 58 per cent. were taken from the territory claimed by Brazil. The local budget for 1898 was 2,453,261 francs; the expenditure of France in the budget of 1899 was 6,363,139 francs, of which 4,915,000 francs were for the penal establishment. Besides Cayenne there are a few other small islands belonging to the colony; one of these is the Ile du Diable, where Alfred Dreyfus was imprisoned until he was ordered, in June, 1899, to return to France for his second trial by court-martial.

FRENCH GUINEA, on the western coast of Africa, between Portuguese Guinea and British Sierra Leone, was separated from Senegal in 1890, and formed into a separate colony, but it is united for administrative purposes with the Ivory Coast and Dahomey, including in the latter the colony proper, comprising the districts of Porto Novo, Kotonu, Grand Popo, and Agoué, as distinct from the French protectorate and native kingdom of Dahomey. In the Ivory Coast there are included with Guinea for administrative purposes the French settlements of the old Gold Coast—namely, Grand Bassam, Assinie, Jackeville, and Grand Lahon. The capital of French Guinea proper is Konakry, and the population of the colony is about 47,500. The territory of Guinea and the adjacent French possessions have seen their share of disputes between the European powers relative to territorial acquisition in Africa. In 1895 the Sierra Leone frontier was determined by an agreement between France and England. The upper course of the Niger was guaranteed to France, and the continuity of French territory in the hinterland of French Guinea was assured. In 1899 the settlement of the "Niger question" affected the area of parts of the hinterland of Dahomey, and the French settlements on the Ivory Coast, France and Great Britain making mutual concessions. About 25,000 square miles is the area of these French territories. See DAHOMEY and NIGER TERRITORIES.

FRENCH LITERATURE. *History.*—The year 1899 was fertile in historical works, and a survey of them serves to emphasize a characteristic which has recently become more and more marked in France—the prevalence of documentary history. The public has come to care less and less for general ideas, for the philosophy of history; what it wants is the plain, bare facts. Two of the most successful volumes of the year, Henry Houssaye's *Waterloo* and Frédéric Masson's *Joséphine de Beauharnais*, are both admirable examples of the documentary history. M. Houssaye deals with the declining period of the Empire, and his facts have been disentangled from an enormous mass of material; he is probably the first Frenchman to make a thorough use of English documents covering the period of the Hundred Days. Yet the volume contains something more than the cold facts, for there is no denying the author's remarkable power of setting people and events vividly before you. This volume would seem to be a definitive history of the battle of Waterloo. M. Masson's new work is as full of anecdote, pleasant sayings, and picturesque episodes as are the previous volumes in the series, and quite as erudite; but he seems to be unnecessarily severe upon Josephine. Probably the recent vogue of Napoleonic literature has had a share in the success of both these volumes. Other works bearing upon the same period are *Louis XVIII. et les Cent Jours à Gand*, a collection of unpublished documents, edited for the Société d'Histoire Contemporaine, by Edouard Romberg and Albert Malet; *Bonaparte et les Bourbons; Relations Secrètes des Agents de Louis XVIII. à Paris sous le Consulat*, published by the Count Remacle, and consisting of 157 letters, the object of which was to keep the king informed as to the movements of the government and the state of public opinion; and *Les Campagnes des Armées Françaises (1792-1815)*, by Camille Vallaux, which admirably sums up in a single

small volume the salient features of all the campaigns of the Revolution and the empire. But the Napoleonic period is not the only one which has received important treatment: the past year has seen new volumes added to three historical works of lasting value. The first of these is Émile Ollivier's *L'Empire Libéral*, of which three volumes had previously appeared; the fourth, which was issued last July, under the title *Napoléon III. et Cavour*, not only contains the history of the establishment of Italian unity, but draws the physiognomy of the Emperor with such profound insight as to render the work indispensable to future students of the period. Of importance also are the fourth volume of Pierre de la Gorce's *Histoire du Second Empire*, which emphasizes the influence of the unfortunate Mexican expedition; and *Louis XIII.: Marie de Médicis, Richelieu Ministre*, which forms the fourth volume of his *Histoire de Louis XIII. et Marie de Médicis*, the preceding volumes being I. *Marie de Médicis et Sully*; II. *Marie de Médicis et Villcroy*; III. *Marie de Médicis, Chef du Conseil*.

Other interesting volumes are: *La Présidence de Jules Grévy*, by E. Zevort, rector of the Academy of Caen, which forms the third volume of a history of the third Republic, the previous two dealing with Thiers and MacMahon; *François II.*, by the Marquis René de Belleval, which constitutes the first part of an extensive work dealing with "the sons of Henry II., the Court, the City, and the Society of their Time," and the initial volume of a new history of France, by the Vicomte de Caix and Albert Lacroix, *La France avant l'Histoire et la Gaule Indépendante*, in which the aid of geology, palæontology, and ethnology has been invoked to reconstruct the picture of these prehistoric times. Lastly, M. Frantz Funck-Brentano, who in 1898 published a curious volume of *Legendes et Archives de la Bastille*, gave us in 1899 a really unique work, *Le Drame des Poisons*, which, according to the sub-title, is a series of "studies of society in the seventeenth century, and more particularly the court of Louis XIV. in the light of the archives of the Bastille."

Biography.—A convenient transition from history to biography is offered by a certain class of memoirs, in which the year 1899 was unusually fertile. Those belonging to the Napoleonic epoch seem to be inexhaustible; this year we have: *Saint-Hélène: Journal Inédit du Général Baron Gourgaud*, who, during the three years from 1815 to 1818 shared Napoleon's exile, and shows us the Emperor more violent, more irritable, more intolerant of contradiction than any writer has hitherto painted him. Under this head also belong *Lettres Inédites de Napoléon Ier*, by M. Léonce de Brotonne. It contains upward of 1500 letters, which the commissions of 1854 and 1864 had not thought it necessary to include in the official collection of the Emperor's correspondence. "The best proof of the impartiality of our work," said Prince Napoleon, after having completed the task of editing *La Correspondance de Napoléon I.*, "would be the publication of the letters which we have omitted; the shadows would bring out the light of the picture; it would be the most favorable judgment for the memory of the Emperor." The wish has now been realized by the publication of this new volume of letters, but it may be gravely questioned whether the new light thrown by them is to the Emperor's credit. Another work of historic importance is *Journal et Souvenirs sur l'Expédition d'Égypte (1761-1801)*, by E. de Villiers du Terrage, who was a member of the Commission of Sciences and Arts that Napoleon took with him to Egypt. Other memoirs deserving mention are those of Mme. de la Ferronnays, daughter-in-law of the ambassador who represented Charles X. at the court of Russia; of the Comte de More, covering the years 1758-1837, part of which were first published in 1827; and those of the Lieutenant-Général Vicomte de Reiset (1775-1810), edited by his grandson, the present Vicomte de Reiset.

The biographies of two princesses which possess considerable historic interest are *Madame Louise de France*, the last daughter of Louis XV., and Marie Leckzinska, written by Léon de la Briere, and *La Dernière des Condé*, by Pierre de Segur, which sketches the brief and pathetic career of the last of her line, the Princess Louise-Adelaide de Condé. Lastly, M. Th. Batbedat has celebrated the thirtieth anniversary of the opening of the Suez Canal by a timely and, on the whole, adequate biography, *Lesseps Intime*, full of curious illustrations and anecdotes.

Literary Criticism.—There are several volumes which partake equally of the character of criticism and biography, and one of the most important is Alfred Rebelliau's admirable *Bossuet*, in the Grands Ecrivains Français series. From the time when M. Rebelliau chose as a subject for his university thesis, *Bossuet, Historien du Protestantisme*, he has identified himself in one way or another with the author of *Oraisons Funèbres*; so that when the time came to add this volume to the series it seemed not merely desirable but almost foreordained that the choice should fall upon him. The chief merit of the book is due to the fact that the author has emancipated himself from tradition, and refuses to give us the conventional Bossuet. At the outset he says: "Bossuet was not an exceptional being; he had, like other people, his development, his progress, his variations; . . . he depended upon his age more

than his age upon him. In place of that magnificent but false Bossuet, who has hitherto been shown us, planted, so to speak, like a statue, in the midst of Louis Fourteenth's century, we must substitute the true Bossuet, who changed, who struggled who *lived*." *La Vie et les Œuvres de Voltaire* is a bulky work in two volumes, by M. L. Crousle, who is professor in the Faculty of Letters at Paris, and shows scrupulous care and great erudition. Two interesting volumes are consecrated to Montaigne: *Introduction aux Essais de Montaigne*, by Edmé Champion, and *Montaigne: Etudes et Fragments*, a posthumous volume by Guillaume Guizot, which embodies all that remains of twenty years' study of the *Essais*, in preparation of a definitive edition of Montaigne's works, which was one of the unfulfilled dreams of Guizot's life. *Trois Idées Politiques* is the title which M. Ch. Maurras has found to hold together his three essays upon Chateaubriand, Michelet, and Sainte-Beuve. Gustave Larroumet contributes a volume of *Nouvelles Etudes d'Histoire et de Critique Dramatiques*, including essays on the New Comedy, on Hervieu, Donnay, and Richepin, on Duse and Novelli. A volume of literary studies which deserves a passing word of praise is *Humor et Humoristes*, by Paul Acker, containing skilfully drawn characterizations of such writers as Jules Renard, Alfred Capus, Tristan Bernard, Pierre Veber, and others belonging to that group. Ferdinand Brunetière's recent articles upon history and literature have been collected into a volume, while Gaston Deschamps has, between his weekly studies of "La Vie Littéraire" in the *Temps*, found time to give us a political treatise, *La Malaise de la Démocratie*. Lastly there is a *Balzac Ignoré*, by Dr. Cabanès, and *Les Eléments d'une Renaissance Française*, by Saint-Georges de Bouheliér, the contents of which range from Jean Jacques Rousseau to Zola, from General Boulanger to Gabriele d'Annunzio.

Poetry.—There is a lamentable dearth of good poetry this year. A notable exception is Maurice Rollinat, who, after a prolonged silence, has produced a volume of *Paysages et Paysans*. He is pre-eminently a singer of rural splendors and delights, and in his latest book has preserved the strange accent which made his earliest poems so distinctively his own. Other poets who, like Rollinat, suggest the scent of broom and heather, are François Fabié, professor at the Lycée of Paris, whose latest volume is *Le Clocher*; Auguste Gaud, author of *Les Chansons d'un Rustre*; and Adolphe Métivier, whose amusing dialogues in the patois of Poitou, *Potevins d'Au' fait* (Les Poitevins d'Autrefois), are unfortunately wholly intelligible only to a Poitevin like himself. André Rivoire, a young poet of real promise, has this year contributed a delicious little volume, in which he has amused himself by translating quite freely in ironical "imageries" and sentimental caricatures the old-time poem in which Adénès, king of minstrels, celebrated the misfortunes of *Berthe aux Grands Pieds*. M. Rivoire's verses are so smooth and flexible that they make the original alexandrines of Adénès seem heavy and awkward. Another young poet, Sébastien-Charles Leconte, made his début in the summer of 1899 with *L'Esprit Qui Passe*, which he dedicated to Leconte de Lille, Villiers de l'Isle-Adam, and "the god, Richard Wagner," and which won the half-indulgent, half-ironical approbation of Gaston Deschamps. The following also deserve casual mention: *Les Perles Rouges*, a volume of sonnets by Robert de Montesquiou; *Les Heures Aimées*, by the Baroness de Baye; *Fleurs de Corail*, being impressions which the author, Maurice Olivaint, brought back from a sojourn among the islands of the South Pacific; *Les Heures d'Amour*, by Fernand de Rocher, and *La Bretagne Enchantée*, by Paul Sébillon.

Fiction.—The annual flood of novels is as formidable as ever during 1899, but taken as a whole the quality seems to be scarcely up to the level of the preceding year. Many of the foremost writers have given nothing of importance; among others, Paul Bourget and Marcel Prévost have remained silent. On the other hand, we have had some important volumes from Anatole France, Edouard Estaunié, René Bazin, Eugene-Melchior de Vogüé, a posthumous volume of Maupassant, and what was perhaps the most widely discussed of them all, Emile Zola's *Fécondité*. This was the first of Zola's long-heralded "*Quatre Evangiles*:" Fruitfulness, Work, Truth, and Justice, in which he proposed to follow respectively the fortunes of the four sons of Pierre Froment, the hero of *Lourdes*, *Rome* and *Paris*. The central theme of *Fécondité* is of course the steadily increasing depopulation of France, with all its causes; and these are set forth and discussed with a frankness which would make the volume intolerable in English dress, outside the shelves of a medical library. As for plot, it is less a novel than a family chronicle, in which we follow the history of Pierre's son Matthew and his descendants unto the third and fourth generation; for Matthew and his wife literally interpret the scriptural injunction to "be fruitful and multiply," and they live to see children and grandchildren to the number of over a hundred. In France the book has been received seriously and has made a considerable impression. The veteran critic, Gaston Deschamps, in reviewing it pointed out that "there are two men in the author of *Pot-Bouillé* and *Fécondité*, one of whom takes pleasure in descending to the strangest crudities of thought and of language, while the other rises naturally to lyric heights and the simplicity of the

epic;" and he thinks that in *Fécondité* the poet has decidedly gained the upper hand over the naturalist.

Zola is not the only writer to seek a subject this year in serious social problems. In *La Terre Qui Meurt*, M. René Bazin deals with the depopulation of the country districts, and gives a graphic picture of that district of Marais which is gradually dying, because by slow degrees the peasants are becoming disgusted with the country and are leaving it. Another book which must be classed distinctly as a social novel is Edouard Estaunie's *Le Ferment*—the "ferment" in question being the restless intelligence of the sons of peasants and laborers, whom over-education has rendered discontented with the lot of their parents, and has filled with longings and desires which they are unable to gratify. Anatole France also touches upon certain social and political problems in *L'Anneau d'Améthyste*, the third volume in his inimitable series of *Histoire Contemporaine*, to which his articles now running in the *Figaro* will probably soon form a fourth. There are few writers who have attained Anatole France's skill in the use of that delicate weapon, satire, and the element of comedy which he blends with his attacks upon the foibles and vices of his race is irresistible. Among other novels which call for special mention are *Basile et Sophie*, Paul Adam's brilliantly colored picture of the most dissolute years of the Byzantine Empire; *Lagibasse*, by Jean Richepin, which the author has chosen to label as a "roman Magique," and which takes the reader through such hidden realms of telepathy and occultism as to leave him with the sensations of having passed through a nightmare; and *Père Milon*, the first of a promised series of posthumous stories by Maupassant, the bulk of the present volume being made up of studies which he afterward utilized in other form, many of them as scenes and chapters in his novel *Une Vie*. Among the younger novelists, François de Nion, who came into sudden notice last year with *Les Façades*, has confirmed public opinion by a careful piece of work in the field of the historical novel, *Les Derniers Trianons*, which professes to be the romance of "a friend of Marie-Antoinette," and gives an admirable picture of social life in the reign of Louis XVI. Louis de Robert is another writer of the younger group who has shown distinct promise. His latest story, *La Reprise*, concerns itself mainly with a young wife who fails to feel any stir of emotion for her husband until she has been divorced and is married to another man. The treatment of the theme shows distinct promise, but unfortunately the psychological school of fiction is distinctly on the wane. Still another story, *Le Page*, by a comparatively new writer, Marcel Boulanger, has attracted considerable notice, and has been compared in certain particulars to *Le Lys Rouge*, of Anatole France. The inexhaustible Gyp gives us a characteristic volume in *Monsieur de Folleuil*; Hugues le Roux has found time, in addition to his sociological study, *Le Bilan du Divorce*, to write a romance, *Jeunes Amours*; and last but not least there is a new volume by Pierre Loti, *Reflets sur la Sombre Route*.

The following novels also deserve enumeration: Henri Ardel, *L'Heure Décisive*; Simon Boulée, *La Dame aux Rubans Rouges*; "Brada," *Une Impasse*; Henry Buteau, *Mère Poudrée*; Th. Cahu and Louis Forest, *L'Oubli?*; Félicien Champsaur, *Poupée Japonaise*; Albert Cim, *Émancipées*; Louis Enault, *Un Drame au Marais*; Mme. Octave Feuillet, *Une Divorcée*; Mary Floran, *La Plus Riche*; André Foulon de Vaux, *Madame de Lauragais*; Remy de Gourmont, *Le Songe d'une Femme*; Henry Gréville, *Petite Princesse*; Léon Hennique, *Minnie Brandon*; Georges Lecomte, *Suzerain*; Mme. Lescot, *Sublime Mensonge*; Octave Mirabeau, *Le Jardin des Supplices*; Maurice Montégut, *Ami d'Enfance*; M. de Poiseux, *Le Peintre Gabriel*; Jean Psichari, *L'Épreuve*; Hugues Rebell, *La Calineuse*; Jean Reibrach, *À l'Aube*; Adolphe Retté, *La Seule Nuit*; Art Roë, *Mon Régiment Russe*; Remy Saint-Maurice, *La Maison du Sommeil*; Edouard Schuré, *Le Double*; Léon de Tinsseau, *Les Péchés des Autres*; Gaston Volnay, *L'Iris Noir*. See DRAMA.

FRENCH SOUDAN. The vast stretch of territory known as the French Soudan forms a great hinterland to French Guinea, Senegal, and Dahomey, and has a width east and west of 2000 miles, merging in East Africa into the British-Egyptian Soudan. To the north it connects through the Sahara Desert, which is entirely French territory, with French Algeria, and on the south it connects by means of Lake Tchad with French Congo. Thus all Northwest Africa, from the Mediterranean to the Gulf of Guinea, is continuous French territory, excepting Morocco, Liberia, and the territories of Spain, Portugal, Germany, and Great Britain. The French Soudan embraces an area of about 354,000 square miles, with a population estimated at from 3,000,000 to 4,000,000. About 54,000 square miles of this region was originally annexed by France, the included population being about 360,000. The remainder of the Soudan was placed under protectorates. Northwardly, where the Soudan runs into the French Sahara, is a sparsely peopled desert, crossed by numerous caravan trails, which run from one oasis to another. Southwardly the Soudan becomes well populated, and is watered by the Senegal and by the Niger, the third

largest river in Africa. On this river is Timbuctoo, with navigation to the coast, which was once an extremely important trading station, with an annual commerce estimated at \$20,000,000. Inter-tribal wars have almost entirely destroyed this once valuable trade, and Timbuctoo has become a comparatively unimportant centre. Under French protection and rule the Soudan, it is expected, will regain much of the commerce of former days, when trade with the interior tribes will rapidly increase. A railroad has been partly built to connect the Senegal with the Niger, and lately a line has been proposed, to run from Konakry, the capital of French Guinea, to the Niger. Important agreements made between France and England took effect in 1899, whereby the limits of the Soudan are more definitely fixed than before. This was done by the definite location of the line separating French Dahomey and English Lagos. For the final decision and its relation to the Soudan see NIGER TERRITORIES. A second Anglo-French controversy arose out of the Marchand expedition across the Soudan to Fashoda, which was settled in 1899 by the erection of a definite north and south boundary line, passing between Darfur in Egyptian Soudan, and Wadai, which is thenceforth considered as in the French Soudan. The French were excluded from that part of the Soudan which had been temporarily evacuated by Egypt after her recent wars there, but France was given equal commercial privileges with Great Britain on the Nile and its confluent. (See further the article EGYPT.) Several important political happenings are recorded for the Soudan in 1899. The Voulet-Chanoine mission was undertaken for the purpose of putting an end to certain disorders which had developed in the previous year, and which resulted in the murder of a French captain, Caze Majou, and also to insure the effective occupation of this region. On July 14 the expedition had reached the 14th parallel of latitude, midway between the Niger and Lake Tchad. Charges of misconduct on the part of the chiefs of this mission having reached the authorities, Colonel Klobb, accompanied by Lieutenant Meunier, was sent to make an inquiry and to take command of the mission. Captain Voulet warned Colonel Klobb on hearing of this order that he would not submit. When the latter had advanced with his little column, consisting solely of thirty Senegalese riflemen, Voulet gave the order to fire, and Colonel Klobb, as well as Lieutenant Meunier, fell mortally wounded. In the foreign press this crime was taken as a sign of the confusion that reigned in the government of the colonies. On the whole, however, the incident was most exceptional, and stands out in marked contrast to the general conduct of French soldiers in Africa. Voulet and Chanoine, after having been outlawed by the French government, were shot by some of their own men some time in October, 1899. By the governmental decree of October 17, French West Africa was reorganized by abolishing the separate status of the colony of the French Soudan. The reasons for this decree were that the French authority was so well established in that region that there was no danger henceforth of serious resistance at the mouth of the Niger; that the French territory, from the hinterland of Morocco to the western coast, was continuous, and that a regular network of telegraph lines united the colonies on the coast with Senegal; that it seemed possible to attach the French Soudan to the coast colonies of Senegal, French Guinea, Ivory Coast and Dahomey. Two military districts were excepted from the operation of this decree—namely, those whose capitals are Timbuctoo and Wagadougou, which are to be under military commandants. This decree was taken as a sign that the period of military administration had closed, and that the time had come for giving this region a civil government and looking to its economic developments. The principal difficulty has been with the natives in the vicinity of the Lake Tchad region, where a native chief of considerable ability had set up a strong government. Three officers and twenty-seven Senegalese officers were murdered in 1899 in Central Soudan. Late in 1899 it was reported that the early permanent subjection of the unruly tribes in this portion of French Africa was certain.

FRIENDS, SOCIETY OF, generally known as Quakers, has four principal divisions—the Orthodox Friends, which in 1899 had 1279 ministers, 830 churches, and 92,344 church members; the Hicksite Friends, with 115 ministers, 201 churches, and 21,992 members; the Wilburite Friends, with 38 ministers, 53 churches, and 4329 members, and the Primitive Friends, with 11 ministers, 9 churches, and 232 members. The next biennial conference is to be held in the summer of 1900 at Chautauqua. An educational conference was held in the summer of 1899 at Providence, R. I. A new constitution and discipline was adopted in 1899 for the American yearly meetings, which is intended more closely to unite all the 14 independent bodies of the Orthodox Friends. The new discipline provides for the harmonious following out of the efforts to civilize Indians, securing peaceful substitutes for war, and other aims. There was a notable growth of Young Friends' Associations, that of Philadelphia having completed during 1899 a \$100,000 building. The latest report of the commissioner of education (1899) shows the Friends to have 7 institutions of learning with 90 professors, 782 students, and endowment funds aggregating \$1,177,000.

FRUIN, ROBERT, Dutch historian, died in Leyden, January 29, 1899. He was born in Rotterdam on the 14th of November, 1823; he studied in Leyden and became in 1850 a high-school teacher in that city and in 1860 professor of Dutch history in the university. He relinquished his professorship in 1893. For a time Professor Fruin served under the government as Holland historian. He published periodically a number of valuable articles on the history of the republic and on the history of law in the middle ages. His principal work is *Tien jaren uit den 80-jarigen oorlog*, 1861. He revised the *Bijdragen voor vaderlandsche geschiedenis*.

FULLER'S EARTH. Florida continues to produce the greatest quantity of the native earth, the output for 1898 being 14,860 long tons, valued at \$106,500.

FUNSTON, FRED, brigadier-general, U.S.V., who in 1899 was in command of the Twentieth Kansas Volunteer Regiment in Luzon, is the son of Mr. Edward H. Funston, member of Congress from Kansas from 1884 to 1893, and was born in Ohio, November 9, 1865. His family moved to Kansas in 1867. Young Funston was graduated in 1886 from the Iola High School, and then studied for two years at the Kansas State University, Lawrence. In 1890 he was a reporter in Kansas City, and the next year joined the United States expedition to the Death Valley of California; the party suffered great hardships. In 1893 Funston was one of the commissioners sent out by the Department of Agriculture to explore Alaska and report on its flora; the following winter—1893-94—he was in camp on the Klondike and floated down the Yukon alone in a canoe. Subsequently he appeared as a lecturer and for a time was a railroad employee. In 1896 he joined one of the Cuban filibustering expeditions, so called, and fought for eighteen months under General Gomez, especially distinguishing himself at Guimara and taking part in twenty-one other engagements. He was wounded and suffered from Cuban fever. Disgusted with the Cubans on account of the execution of some prisoners, he left the army, but was captured by the Spaniards. He soon, however, succeeded in reaching New York. In 1898 Funston was commissioned colonel of the Twentieth Kansas Volunteers, which regiment was mustered in on the 13th of May, and with it was ordered to the Philippines. The regiment took part in the capture of Manila in August, and after the outbreak of February 4, 1899, was active in the operations against the insurgents. Colonel Funston distinguished himself on several occasions, his gallantry culminating on April 26, when, though under heavy fire he and a few followers swam across the Rio Grande River before Calumpit, in order to make fast a rope by which the Americans could guide rafts across the stream, for the bridge had been wrecked and the Rio Grande was not fordable. The Americans crossed over, and Calumpit was taken. In reporting the battle, General E. S. Otis said that the passage of the river was "a remarkable military achievement, the success of which was due to the daring, skill, and determination of Colonel Funston." In recognition of Funston's services, President McKinley on May 2, 1899, advanced him to the rank of brigadier-general of volunteers. Later in the year General Funston returned to the United States, and on November 2 was presented with a sword by the State of Kansas.

FURNACES, GARBAGE. See GARBAGE AND REFUSE COLLECTION AND DISPOSAL.

GABOON. See FRENCH CONGO AND GABOON.

GALLIFFET, GASTON ALEXANDRE AUGUSTE, MARQUIS DE, French general, assumed the portfolio of war in the ministry organized by M. Waldeck-Rousseau on June 22, 1899. At this time he was regarded as a believer in the innocence of Alfred Dreyfus, but as an advocate of a conciliatory policy. The general is, however, a man of much force and insists on strict military discipline. He has been credited with monarchical sympathies, but in 1899 the Duke of Orleans tried in vain to enlist his support.

General Galliffet was born in Paris, January 23, 1830; he entered the army in 1848, served in the Crimean War, and in 1863 took part in the war in Mexico. In 1867 he was made a colonel, and was given command of a regiment, which in 1870 was part of the Army of the Rhine. Promoted to brigadier-general in August of the latter year, he distinguished himself at Sedan on September 1 in an attack of French cavalry on the Prussian infantry at Floing, but his daring resulted in capture. After being liberated, he received in March, 1871, the command of a brigade in the Army of Versailles, and was given the task of putting down the Commune. In this work he acquitted himself with courage and skill, but got a reputation for cruelty. He was then sent to Africa, and in the winter of 1872-73 undertook a daring expedition to El Colea. After the reorganization of the army, he received in 1875 the command of the Fifteenth Infantry Division in Dijon, and in 1879 became commander of the Ninth Army Corps in Tours. In 1882 he resigned the command of the troops in Paris, to which he had been appointed two years before, and continued merely as a member of the council of war and as president of the committee on cavalry. From this position he was removed in 1886 by the Radical minister of war Boulanger.

The new French cavalry rules of 1882 were written by General Gallifet. He is one of the foremost generals in France.

GALTON, Sir DOUGLAS, D.C.L., LL.D., F.R.S., a well-known English engineer, died March 10, 1899. He was born in Worcestershire in 1822; was educated at Geneva, at Rugby, and at the Royal Military Academy, Woolwich, passing in the last-named institution the highest examination on record. He was commissioned in the Royal Engineers in 1840, was engaged in work upon the fortifications of Gibraltar in 1843, and four years later served under the Railway Commission. In 1856 he became inspector of railways and secretary of the railway department of the Board of Trade, at which time he made an official visit to the United States. He was made assistant inspector-general of fortifications in 1860. Soon after this he designed and constructed the Herbert Hospital at Woolwich. From 1862 to 1870 he was assistant under-secretary of state for war, and later became director of public works and buildings, retiring in 1875. From 1870 to 1895 he was general secretary of the British Association for the Advancement of Science, and its president in 1895-96. He was a member of the council of the Royal Society; was created a K.C.B. in 1887. He was a recognized authority on sanitary engineering. He wrote *Healthy Dwellings* and *Healthy Hospitals*.

GAMBIA. The British colony of Gambia, the oldest and the most northerly of England's settlements on the West African coast, has an area of only 69 square miles, with a population given in 1894 as 14,978. There is a surrounding sphere of influence possessed by Great Britain in the interior, making a total area for the colony and protectorate of about 2700 square miles, with a population estimated at 50,000. Gambia was first discovered by the Portuguese, and was acquired by the British in the seventeenth century. It is governed by an administrator, assisted by an executive and a legislative council. In 1888 it was separated from the West African settlements and made a separate colony. Its chief town is Bathurst, which is situated on the island of St. Mary and has 6000 inhabitants. Gambia is of some importance, since it commands the Gambia River, up which ocean steamers may freely pass. Trade in Gambia, according to statistics in *Commercial Africa* in 1899, published by the United States Treasury Department, now shows a fair return, although the country is capable of much more development than has been given it. For a time succeeding 1892 both revenue and trade fell off slightly, but in 1897 the imports amounted to \$681,310 and the exports, \$798,106 (exclusive of specie). The average for the five previous years was: Imports, \$559,648; exports, \$691,043. The principal product, ground nuts, in 1897 was exported to the amount of 20,000 tons, a gain of 8000 tons in one year. The export of rubber also improved. Other exports are hides, beeswax, rice, cotton, and corn. Gambia imported about 50 per cent. of its goods from Great Britain, and about a third of her exports were sent there. This class of trade increased in 1896-97 over \$160,000, or about one-third. The proportion of whites in the population is small, but considerable missionary work has been done among the natives. In 1890 there were 2385 Christians in Gambia and about 5300 Mohammedans.

GARBAGE AND REFUSE COLLECTION AND DISPOSAL. In England some of the municipal authorities are working toward the abolition of horses for the collection of ashes, garbage, and other refuse, and the substitution of motor vehicles for the purpose. One or two places in England have put "dust motor vans," as they call them, into service. The authorities in these towns urge that the departments responsible for cleaning the streets should set the example of doing away with the chief cause of dirty and dusty streets—namely, horses. Statistics collected in 1899 by H. J. Gondon, and presented in a paper read before the League of American Municipalities, show that of 37 of the largest cities of the United States, 5 have no public provision for garbage collection; 18 collect by means of public, and 1 by private contractors; in 12 the municipality does the work, and in 1, New York, both systems exist. As to final disposal of garbage, 8 cities employ reduction processes (producing grease and fertilizing material), 6 cremate, 7 dump on land, 3 dump in water, 3 bury in the earth, and 6 feed to swine. In over half of the 37 cities no provision is made for collecting refuse other than garbage. Twelve cities collect through contractors and 4 direct.

In England, and, to a lesser extent on the continent of Europe, there is an increasing practice of utilizing the heat from garbage furnaces or refuse destructors for power for electric stations, and for other purposes. Scarcely any progress in that line has been made in America. In fact, the bills for fuel for most American garbage furnaces are very high, and hitherto it has not been practicable to make the garbage itself serve as fuel for other undertakings. Part of this difference between European and American practice is due to the fact that our garbage and refuse contains less combustible matter than that abroad, besides being heavily laden, oftentimes with moisture, which must, of course, be evaporated before the

waste can be burned. The practice of separating garbage from ashes and light combustible refuse from the first two forms of waste is being extended in this country, but is practised scarcely at all abroad. It is essential that this should be done wherever the garbage is to be reduced to grease and fertilizers, as the other wastes are not only useless for this purpose, but very objectionable as well. The ashes, if kept clean, can be used for filling, thus lessening the distance and expense of hauling, as well as the cost of final disposal, while the combustible wastes may be burned with ease after sorting out the paper, rags, and other material which has a market value. This sorting and burning process has continued in use for a section of New York during 1899, and also for the greater part of Boston. The Brighton district of Boston and the town of Brookline will hereafter be served by a second plant of this character.

GARLAND, AUGUSTUS HILL, one of the foremost lawyers in the United States, and ex-attorney-general, died January 26, 1899, from an apoplectic stroke suffered while addressing the Supreme Court in Washington. He was born at Covington, Tenn., June 11, 1832. The next year his family moved to Washington, Ark. He was educated at Bardstown, Ky., and at the colleges of St. Mary and St. Joseph. In 1853 he was admitted to the bar in his home town, and three years later changed his practice to Little Rock. Not only in the controversies that preceded the Civil War, but in the Arkansas convention, that finally declared for secession, Mr. Garland opposed a withdrawal from the Union. When the secession of Arkansas became a fact, however, he stood with the State, and was one of its representatives in the provisional congress held at Montgomery, Ala., in 1861. He served in both branches of the Confederate Congress, being a senator in 1865. He began again the practice of law in Little Rock, and in 1867 was elected to the United States Senate, but was not allowed to take his seat. In 1874 he was elected governor of his State, and two years later was sent again to the Federal Senate, when he took his seat without opposition. He was re-elected, but in 1885 was called by Mr. Cleveland to serve as attorney-general. He held this office until the end of the administration in 1889.

GAS, ILLUMINATING AND FUEL. The gas companies have less to fear from competition with electricity than formerly. This is due largely to the rapid introduction of incandescent gas burners, which increase the brilliancy and cheapness of gas lighting and decrease the net cost of production. The two important factors in the latter process are the value of the by-products and labor-saving appliances for handling coal and other purposes. The price of gas is going steadily downward, and might go still farther if the enormous amount of waste, through leakage, could be reduced. To the latter end many of the most able gas men are now turning their energies. The leakage is chiefly in pipe distribution systems, many of the gas mains being old and most of them, whether old or new, having been laid with too little attention to making tight joints. In the best work great pains are taken to prevent leakage, but generally still more money could be expended here with great advantage. It has recently been proposed that great savings in construction might be effected by distributing gas under heavier pressures, thus reducing the size of the mains. If this were feasible, as some good engineers believe, the replacing of leaky mains by tight ones would be facilitated.

Acetylene gas is coming into use for lighting isolated buildings, and has been adopted for lighting a few small towns that are without ordinary coal-gas facilities. English figures place the cost of lighting by acetylene at \$7.07 per 1000 cubic feet for material alone and at \$8.02 in the holder, including depreciation of plant in the latter case. On this basis the cost of a given amount of light from acetylene would be equivalent to coal gas at 61 cents per 1000 cubic feet, provided 31 candle-power burners were used, or double that for 8 candle-power burners. See CALCIUM CARBIDE.

GAS, SEWER. See SEWER GAS.

GATACRE, Sir WILLIAM FORBES, K.C.B., major-general in the British army, had an important command in the Boer war during the latter part of 1899. On November 28 he occupied Bushman's Hoek, Cape Colony, the Boers retreating. On December 10, near Stormberg junction, he suffered a serious reverse, which was one of the three great disasters to British arms during the month—the other two being the defeat of General Methuen on the 12th, at Magersfontein, and that of General Buller on the 15th near Chieveley on the Tugela. The reported British casualties at Stormberg, including 672 prisoners, were 687.

General Gatacre was born in 1843, and entered the Seventy-seventh Foot in 1862. From 1875 to 1879 he was an instructor in surveying in the Royal Military College at Sandhurst. In 1888 he was deputy adjutant and quartermaster-general in the Hazara expedition, for his services in which he was made a Companion of the Distinguished Service Order and was awarded a medal with clasp. In 1889 he served in Burmah. For his work in Chitral in 1895, having commanded at Mamugai the

passage of Janbatai and the Lowari passes, he received more honors, and was made a Companion of the Bath. During the first advance on Atbara, in 1898, General Gatacre had a command in the Soudan; and later in the year he commanded a British division in the Soudan during the advance to Khartoum and Omdurman. In 1898 he received the command of the southeastern district in the British army, his last command before taking the field against the Boers.

GEMÜNDER, GEORGE, a famous violin-maker, died at Astoria, L. I., January 15, 1899. He was well known throughout the musical world, and made violins for many famous musicians, including Remenyi, Ole Bull, and August Wilhelmj. Gemünder was born at Ingeffingen, Württemberg, April 13, 1816, and studied under his father, a maker of string instruments. After his father's death, about 1835, George went to Vienna, Munich, and Presburg, and finally settled at Strasburg. It was not long, however, before he succeeded in securing a position under Guillaume, the noted violin-maker of Paris, where his talent was greatly developed. He came to the United States in 1845, and after a time settled in Boston. In 1851 he sent to the exposition at London violins in imitation of the works of Guarnerius, Stradivarius, and Nicholas Amati, and received special award. Gemünder removed to New York in 1852, and here he was visited by many famous violinists, including Thalberg, Spohr, and Viextemps. He was eminently successful in his imitations of Stradivarius and Amati violins, and was wont to amuse himself by deceiving experts until they were at the point of buying the instruments; indeed, the violin he sent in 1873 to the Vienna exposition, made in imitation of a classic instrument, was declared by the committee of experts to be not a modern violin, but a genuine Guarnerius. He continued active work until 1894. It is said that Gemünder's violins won the highest prizes at ten world's fairs. His brother August died in 1895, and biographical articles written then confused the two men. August was a manufacturer of pianos and double basses.

GEOFFRION, CHRISTOPHE ALPHONSE, D.C.L., prominent Canadian lawyer, and member of the Dominion cabinet without portfolio, died at Dorion, July 18, 1899. He was born at Varennes, November 23, 1843; was educated at St. Hyacinth College, and in 1868 was graduated in law at McGill University. In 1866, however, he had been admitted to the bar, and he subsequently attained a place in the foremost rank of Canadian lawyers. He was a Liberal in politics.

GEOGRAPHICAL DISTRIBUTION. See ZOOLOGICAL LITERATURE (paragraph Special Treatises).

GEOLOGICAL SOCIETY OF AMERICA, founded in 1888, had in 1899 a membership of 239, and published Vol. XI. of its *Bulletin*. General meeting for 1900 to be held at New Haven, Conn., December 27. President, B. K. Emerson, Amherst College; secretary, H. L. Fairchild, University of Rochester, New York.

GEOLOGICAL SURVEYS. During 1898 and 1899 the various State and government surveys have continued to increase in practical value, the economic side of the various geological investigations undertaken by them receiving special attention. This is evidenced by the following publications, which have appeared during 1899:

United States Geological Survey.—The following monographs appeared: *Geology of Old Hampshire County, Mass.*; *Geology of the Aspen Mining District*; *The Later Extinct Floras of North America*; *The Yellowstone National Park*. Irrigation Bulletins: *Irrigation Near Merced, Cal.*; *Experiments with Windmills*; *Wells of Northern Indiana*; *Sewerage Irrigation, Pt. II.*; *Water Right Problems of the Big Horn Mountains*; *Water Resources of the State of New York, I. and II.*; *Wells of Southern Indiana*; *Operations at River Stations in 1898*; *Wells and Windmills in Nebraska*; *Water Resources of the Lower Peninsula of Michigan*. Annual Reports: Vol. XIX., Pts. 1, 4, 6, and 6 continued; Vol. XX., Pt. 6.

Among the reports which have been issued by the various State Geological Surveys during the past year, the following may be mentioned:

Alabama.—Report on Iron Making in Alabama; Map of Warrior Coal Field.

Georgia.—This State has issued two bulletins, one on the clays of southern Georgia, the other on the artesian wells of Georgia.

Indiana.—The Twenty-third Annual Report of the State Geologist deals entirely with the coal deposits of Indiana.

Kansas.—Annual Bulletin on the Mineral Resources of Kansas for 1898, and Special Report on the Gypsum Industry of Kansas.

Michigan.—Vol. VI., containing a report on the Geological Structure of Isle Royale and Keweenaw Point, and one on the Calcites of the Lake Superior Region.

Minnesota.—Vol. IV. of the final report of the Geology and Natural History Survey.

New Jersey.—The Annual Report for 1898 contains an article on surface geology, artesian wells in New Jersey, water supply from wells, and mineral statistics.

New York.—Vol. II. of the State Geologist's Report for 1895 has appeared, being a monograph on certain paleozoic sponges.

South Dakota.—Bulletin No. 2, containing several reports on different counties, and also one on the limits of the artesian basin.

West Virginia.—Vol. I. contains many valuable data on the geology and on the petroleum and natural gas and well records.

Wisconsin.—Bulletin No. 4, on the building and ornamental stones of Wisconsin.

Iowa.—Ninth Annual Report, containing various county reports, and one on the artesian wells of the Belle Plaine Area.

British Columbia.—Annual Report of Minister of Mines for 1898.

Finland.—Bulletins containing reports on metamorphic rocks of southwestern Finland, and on the elevation of shore-lines.

Great Britain.—Memoir on the Silurian Rocks of Great Britain—Pt. 1, Scotland; Summary of the Progress of the British Geological Survey for 1898.

New South Wales.—The Copper Mining Industry and Copper Ores of New South Wales; Diamonds and Their Occurrence in New South Wales; Notes on Gold Dredging; Report on the Wyalong Gold Field.

New Zealand.—Papers and reports relating to mines and mining, issued by minister of mines.

Ontario.—Report of the Ontario Bureau of Mines, Vol. VIII.

Quebec.—Report on the Mines of the Province of Quebec for 1898.

Sweden.—The Iron Ore Fields of Kiirunavaara and Luessavaara, Sweden.

GEOLOGY. The geological age of the earth continues to be an interesting topic, and in a recent address before the Geological Section of the British Association Sir Archibald Geikie reviewed the matter in a masterly way. Lord Kelvin, who in 1862, in discussing the problem from the physicist's point of view, concluded that the earth's age was not less than twenty and not over four hundred million years, has recently modified his views in placing the maximum age at less than forty, a conclusion not accepted by all physicists. The latter, however, have given singularly little attention to the evidence brought forth by the geologists and palæontologists. An emphatic point made by the former is that it is impossible to discover any indications that geological forces, such as the denudation of the earth's surface, mountain elevation, and volcanic action have acted any more violently or rapidly in the past than they are doing in the present; there is no evidence among the sedimentary rocks of colossal floods, tides, etc., but there is strong proof of continuous orderly deposition, such as can be witnessed to-day in any portion of the globe. The palæontological evidence permits of an equally strong argument in support of the view that the age is fully a hundred million years. One of the great hindrances to the proper solution of the question is the want of proper numerical data, which indicates that much remains to be done, and that innumerable observations must be carried on in the field of experimental geology, both in the field and laboratory. Professor J. Joly discusses the age of the earth since the formation of the ocean, and bases his calculations on the time required to supply to it the amount of sodium now present in the water. His calculations place the age of the earth at eighty-nine million years.

Keyes discusses the value of the term Permian, and points out that while we have in America a great succession of deposits similar to the original Russian Permian, still the two areas had no direct connection during the time of their deposition, and that the Russian Permian constitutes a province by itself, and consequently in a general classification the term can only be considered as of the third order. Prosser correlates the carboniferous rocks of Nebraska with those of Kansas, and Knight shows that the Permian occurs in Nebraska and is an extension of the Kansas area.

Of the geological literature of 1899, the following books may be mentioned: *The Principles of Stratigraphic Geology*, J. E. Marr; *Outlines of the Earth's History*, N. S. Shaler; *Geology for Beginners*, W. W. Watts; *La Geologie Experimentale*, S. Meunier, in which the author discusses in a popular manner a number of geological phenomena both common and rare. The first part of the new text-book of comparative geology by Fritz Frech has appeared, and is entitled *Lethæa Gcognostica*. Among the important papers are: *Geologic Notes on the Wichita Mountains, Oklahoma, and the Arbuckle Hills, Indian Territory*, T. W. Vaughan; *The Newark Rocks of New Jersey and New York*, H. B. Kummel; *The Crystals Falls Iron-Bearing District*, J. M. Clements and H. L. Smyth, Mon. 19th Ann. Rep. U. S. G. S.; Monograph XXXI of the United States Geological Survey, on the *Geology of the Aspen District in Colorado*, sets forth in a clear and able manner the structure and mode of occurrence of the ores in this celebrated district; *Geology of the Lake Placid Region*, J. F. Kemp, *Bulletin* New York State Museum, Vol. V.; *Parallelisi-*

runge der Meeanbildungen des piementosischen Tertiars mit dem des Wiener Beckens, F. Schaffer; *Les Massifs du Chettaba et les lits Triasiques de la Région de Constantine*, E. Fichet; *Sur la Géologie des Terraines Sédimentaires de Madagascar*, M. Beule; *Sur les Klippen des Basses Pyrénées*, C. Authelin; *Geologische Uebersicht des Königsreich Serbien*, J. M. Zujevic. See GLACIAL GEOLOGY and GLACIERS.

GEOGRAPHICAL SOCIETY, AMERICAN, founded in 1852, had in 1899 a membership of 1200. The society aims to encourage geographical exploration and discovery, to disseminate new geographical information, and to establish in a maritime city of the United States a central bureau of geographical knowledge. Corresponding secretary, Chandler Robbins, 11 West Twenty-ninth Street, New York City.

GEORGE ALEXANDROVITCH, Grand Duke and Czarowitz of Russia, brother of Nicholas II., died at the imperial palace at Abbar Touman, in the Caucasus, July 10, 1899. He had always been delicate physically, and as he had latterly contracted consumption, his death for some time had been expected. He was born at Tsarskoie-Selo, April 27, 1871. He became a lieutenant of the first class and a chevalier of the Order of St. Andrew, of the Order of the Elephant, and of the Order of the Black Eagle. He was said to be a prince of unusual intellectual powers and had a genuine interest in naval science. He translated into the Russian language Captain Alfred T. Mahan's *Influence of Sea Power Upon History*. The new Czarowitz, or heir to the Russian throne, is a younger brother of the Emperor, the Grand Duke Michael, who was born in 1878.

GEORGIA, a southeastern State of the United States, has an area of 59,475 square miles. The capital is Atlanta.

Agriculture.—The following shows the production and value of the principal crops in the calendar year 1899: Corn, 32,494,790 bushels, value, \$16,247,395; wheat, 2,021,225, \$1,980,800; oats, 4,291,857, \$2,060,091; rye, 94,830, \$106,210; potatoes, 257,324, \$213,579; and hay, 158,466 tons, \$2,083,828. Live stock January 1, 1900, comprised, horses, 109,935, value, \$6,001,626; mules, 157,008, \$10,826,032; milch cows, 285,431, \$6,836,072; other cattle, 380,716, \$4,216,054; and sheep, 294,826, \$518,893.

Mineralogy.—During the calendar year 1898 the output of gold was 6221 fine ounces, valued at \$128,600, and of silver, 500 fine ounces of a commercial value of \$646. Quarrying yielded granite to the value of \$339,311; slate, \$13,125; marble, \$656,808, and limestone, \$57,803—in all, \$1,067,047. The production of bauxite in the Georgia-Alabama field was 25,149 long tons, valued at \$75,437; of coal in the Georgia-North Carolina belt, 255,682 short tons, valued at \$212,537, an increase in a year of 38,533 tons; and of iron ore in the Georgia-North Carolina district, a total of 160,083 long tons of red hematite, brown hematite, and carbonate, valued at \$129,468. See ALUMINIUM; ASBESTOS; CLAY.

Manufactures.—In the fiscal year ending June 30, 1899, the collections of internal revenue on taxable manufactures aggregated \$941,726. There were 11 manufactories of tobacco and 85 of cigars, and the production was 3,285,597 cigars, 85,650 cigarettes, 178 pounds of plug tobacco, and 10,257 pounds of smoking. The fruit and grain distilleries in operation numbered 291; the production of fruit brandy was 22,194 gallons; amount of distilled spirits gauged, 727,502 gallons; and output of fermented liquors, 117,488 barrels. During 1899 the textile industries were remarkably active and prosperous. Ten new cotton mills, equipped with the latest type of machinery, were established during the year, and a number of old ones were enlarged or refitted. In Atlanta conditions were such as to warrant a promise of an advance in wages to all operatives on January 1, 1900, and in Dalton the Crown Mill broke the world's record in cotton-mill dividends with a declaration of 83 per cent. in stock and 10 per cent. in cash, against a total dividend of 43 per cent. in 1898. This plant is now being enlarged by the erection of another \$100,000 mill. An interesting new feature of this industry is that cotton factors have established a handsome direct trade with China. See COTTON and the COTTON INDUSTRY.

Commerce.—During the fiscal year ending June 30, 1899, the imports of merchandise at the ports of Brunswick, St. Marys, and Savannah aggregated in value \$382,129, and the exports, \$34,470,333, of which Brunswick shipped \$10,421,488 and Savannah \$24,029,572. The total foreign trade was officially \$4,724,552 less than in the previous year. These figures do not give the true amount of the State's foreign trade, for a considerable amount of commodities is delivered in other States and credited to their ports.

Railroads.—In 1898 the new railroad construction amounted to 129.78 miles, and in 1899 to 144.60 miles, giving the State a total mileage of 5687.30, the largest of any Southern State. The corrected assessed valuation of railroad property was \$42,695,508 in 1898 and \$43,933,866 in 1899.

Education.—In July, 1899, Hon. W. B. Hill, of Macon, was elected chancellor of the University of Georgia to succeed Dr. W. B. Boggs, resigned. The Georgia School of Technology, at Atlanta, wove its first piece of cloth on September 22 while the looms were being tested. All the machinery of the textile department was assembled and in running order before the end of the year, and the department was pronounced the best equipped one in the country. At the close of the school year 1897-98 the school population was 744,500; enrolment in public schools, 450,832; and average daily attendance, 278,715. There were 9505 teachers, 6622 buildings used as school-houses, and public school property valued at \$3,977,070. The revenue was \$1,745,200; expenditure, \$1,758,106, of which \$1,515,698 was for teachers' salaries. There were 105 public high schools, with 237 teachers, 5454 secondary students, and 4241 elementary pupils; 67 private secondary schools, with 193 teachers, 3390 secondary students, and 6986 elementary pupils; 2 public normal schools, with 34 teachers and 1060 students in all departments, and 3 private ones, with 25 teachers and 625 students. Eleven colleges and universities for men and for both sexes reported 1 fellowship, 8 scholarships, 135 professors and instructors, 2777 students, 83,410 volumes in the libraries, \$75,450 invested in scientific apparatus, \$1,569,000 in grounds and buildings and \$855,618 in productive funds, \$148,925 in total income, and \$59,750 in benefactions. A like number of colleges for women had together 181 professors and instructors, 1803 students, 23,860 volumes in the libraries, \$17,475 invested in scientific apparatus, \$715,000 in grounds and buildings and \$100,000 in productive funds, \$197,800 in total income, and \$14,000 in benefactions. In 1899 there were 372 periodicals, of which 25 were dailies, 290 weeklies, and 40 monthlies.

Banks.—On October 31, 1899, there were 27 national banks in operation and 17 in liquidation. The active capital aggregated \$3,756,000; circulation, \$1,280,160; deposits, \$8,995,337; and reserve, \$2,565,385. The State banks, September 5, 1899, numbered 136, and had capital, \$9,240,828; deposits, \$21,150,309; and resources, \$37,577,934. The exchanges at the United States clearing houses at Savannah and Atlanta in the year ending September 30, 1899, aggregated \$214,529,972, an increase of \$12,689,624 in a year.

Finances.—The recognized bonded debt October 1, 1899, was \$7,936,000, of which \$4500 was past due and probably lost or destroyed. There were also contingent liabilities, in railroad bonds endorsed by the State, amounting to \$464,000. The State owns the Western and Atlantic Railroad, 138 miles long, and leases it at an annual rental of \$420,012. Assessed valuations in 1899 comprised real estate, \$235,410,751; personal property, \$137,516,326; railroads, \$43,933,866—total, \$416,860,943, an increase in a year of \$5,047,032; and the tax rate was \$5.36 per \$1000.

New Penal System.—The report of the State Prison Commission, submitted to the legislature in October, 1899, congratulates the people of the State on the results of the complete change in the penal system which went into effect in April preceding. The most important feature of the new law is that the old method of leasing convicts indiscriminately, which led to countless evils and protests, is discarded entirely.

Population.—As estimated by federal officials, the population on June 30, 1899, was about 2,240,000.

Legislation.—A commission was created, consisting of the governor, the State treasurer, and the comptroller-general, which is to prepare and issue State bank-notes to State banks to an extent not exceeding 75 per cent. of their paid-up capital, these notes to be a first lien upon the bank's assets, and stockholders to be liable for their redemption to an amount equal to the capital stock owned. A reserve of 25 per cent. of the bank's outstanding notes must be kept on hand in legal tender notes or specie. If the United States government attempts to collect the tax of 10 per cent. upon State bank-notes, provided by the federal law, the attorney-general will test the constitutionality of the federal statute. The action under this interesting piece of legislation will be watched with much interest. A law was enacted that judges shall decide motions and demurrers within thirty days after their submission, and the equity rule was changed so that the answer of defendant as to facts of his own knowledge, responsive to discovery sought, shall be evidence in favor.

State Officers and National Representatives.—Governor, Allen D. Candler; secretary of state, Philip Cook; treasurer, W. J. Speer; comptroller and insurance commissioner, W. A. Wright; adjutant-general, J. M. Kell; attorney-general, J. M. Terrell; superintendent of education, G. R. Glenn; commissioner of agriculture, O. B. Stevens; Supreme Court: Chief justice, Thomas J. Simmons; associate justices, Samuel Lumpkin, Henry T. Lewis, Andrew J. Cobb, William A. Little, William H. Fish; clerk, Z. D. Harrison. The State legislature consists of 209 Democrats, 2 Republicans, and 8 Populists. Senators, Alexander S. Clay, from Marietta, and Augustus O. Bacon, from Macon—both Democrats. Representatives, Rufus E. Lester, from Savannah; James M. Griggs, from Dawson; E. B. Lewis, from Montezuma; W. C. Adamson, from Carrollton; L. F. Livingston, from Kings; Charles L. Bartlett, from Macon; John W. Maddox, from Rome; W. M. Howard, from Lexington.

ton; F. C. Tate, from Jasper; W. H. Fleming, from Augusta; W. G. Brantley, from Brunswick—all Democrats.

GERLAOHSTEIN, Count HOHENWART, Austrian statesman, was born in 1824 and died at Vienna, April 26, 1899. He was the leader of the Conservative Autonomist party. From February to October in 1871 he was the Austrian premier and minister of the interior.

GERMAN EVANGELICAL SYNOD OF NORTH AMERICA, founded in 1840, is a union of Lutheran and Reformed churches, and in 1899 reported 891 pastors, 1123 churches, and 202,415 communicants, with 956 Sunday-schools, 9939 teachers, and 97,631 scholars. The mission in East India reported 447 baptisms.

GERMAN LITERATURE. History and Biography.—A salient feature of the annual literary output in Germany is the large proportion of historical works bearing upon the history of that country; and of the formidable array of bulky tomes, local annals, records of public archives, monographs, and inaugural dissertations which go to swell the list for 1899, it will be possible here to mention specifically only a very small porportion. Indeed, an important part of the historical material now in course of publication, consisting of series of public documents, such as the *Monumenta Historiae Germaniae*, or the *Quellen zur Geschichte der Stadt Wien*, is hardly entitled to be mentioned under the head of literature. Of the publications of the past year, one of the most interesting, both for its historical and its literary merit, is the eighth volume of Felix Dahn's monumental work, *Die Könige der Germanen*. This veteran and prolific writer, who is by turns poet, novelist, and historian, and has for many years been professor of law at the University of Breslau, wrote the first six volumes of his principal work during the years 1861-71. Here it rested for over twenty years, since Vol. VII. was not begun until 1894, while of Vol. VIII., which deals with *The Franks Under the Carolingian Kings*, five parts, comprising upward of 1500 pages, are now ready. An interesting monograph which should properly be mentioned here, as also bearing upon the early history of the Germanic people, is E. Selmsdorf's *Die Germanen in den Balkenländern bis zum Auftreten der Goten*. Two comprehensive works, dealing with special epochs of the nation's history, are in course of publication: Gustav Wolf's *Deutsche Geschichte im Zeitalter der Gegenreformation*, and K. T. Heigel's *Deutsche Geschichte vom Tode Friedrichs des Grossen bis zur Auflösung des alten Reiches*, the first volume of which covers the period 1786-92, or from the death of Frederick the Great to the campaign in Champagne. Two other volumes which deserve a passing mention are the second part of Von Lettow-Vorbeck's *Geschichte des Krieges von 1866 in Deutschland*, which covers the period of the campaign in Bohemia, and H. Ulmann's *Russisch-preussische Politik unter Alexander I. und Friedrich Wilhelm III. bis 1866*. The second part of W. von Hassell's exhaustive history of the kingdom of Hanover appeared last summer, and includes the events of the years 1849-62. Like the previous volume, it owes its value to the extensive use which the author has made of hitherto unpublished documents. Another interesting local history, in course of publication, is a *Geschichte der Stadt Bremen*, by W. von Bippen, who is making good use of the exceptional opportunities which he enjoys as keeper of the archives of that city. Otto Wiedfeldt contributes a volume of statistical studies on the history of the development of industries in Berlin from 1720 to 1890, which is of considerable value, both historical and economic, since it traces the transition from the industrial system of the middle ages to the methods in vogue to-day. Among the few historical works of the year which deal with other nations than Germany may be singled out for mention the second part of E. Caro's *Genua und die Mächte am Mittelmeer, 1257-1311*; *Das Republikanische Brasilien in Vergangenheit und Gegenwart*, by Oskar Costatt, a bulky volume of nearly 500 pages; a voluminous history of Bohemia, by Adolf Bachmann, in the comprehensive series of *Geschichte der Europäischen Staaten*, which is being edited by A. H. L. Heeren, F. A. Ukert, and others; and an especially timely volume in Dr. Alfred Zimmermann's important work, *Die Europäischen Kolonien*, being the second part of the volume dealing with *The Colonial Policy of Great Britain*, which covers the period from the independence of the United Kingdom down to the present day.

History and biography are pleasantly blended in such works as C. Wölflgruber's *Franz I., Kaiser von Oesterreich*; *Philipp II., August, König von Frankreich*, by A. Cartellieri, the second part of which covers the years 1180-86; and Max Immich's *Papst Innocens XI.*, which professes to be both "a research into the history of his political acts and a characterization of his personality." As might be expected, the Bismarck literature continues this year with little abatement; among the more important of the recent volumes may be mentioned: G. von Wilmowski, *Meine Erinnerungen an Bismarck*, edited by M. von Wilmowski; *Bismarck-Denkwürdigkeiten*, by P. Liman, being a collection of memorabilia, drawn from Bismarck's letters, speeches, etc., and amplified by personal recollections of the author; and

Bismarck 1888-98, by E. von Redern, who devotes upward of three hundred pages to a well-documented account of this significant decade in the life of the Iron Chancellor. To this list should be added a suggestive monograph by R. Bonin, *Luther, Lessing, Bismarck im Werdegang des Deutschen Volkes*. Among other statesmen who in 1899 received notice are Von Humboldt and Kaunitz. The second volume of Gebhardt's *Wilhelm von Humboldt als Staatsmann*, follows the story of Von Humboldt's life down to the time of his retirement from office. A. von Arneth has written the *Biographie des Fürsten Kaunitz*, while the correspondence which passed between Kaunitz and Von Spielmann during the years 1779-92 is edited by H. Schlitter. The present vogue of Cromwell literature seems to have spread to Germany, for she adds one rather heavy volume to the list. It is by S. von Bischoffshausen, and bears the ponderous title, *Die Politik des Protektors Oliver Cromwell in der Auffassung und Thätigkeit seines Ministers des Staatssekretärs John Thurloe*.

As was to be expected, the 150th anniversary of Goethe's birth gave a new impetus to Goethe literature. The limits of space make it impossible to do more than mention the titles of some of the more important of these numerous publications. They include a new volume of *Goethe-Forschungen*, by the well-known Goethe-student, Woldemar von Biedermann; the first part of an ambitious work by Dr. Albert Bielschowsky, *Goethe, sein Leben und seine Werke*, which follows the poet's career as far as his return from Italy; *Goethes Jugendfreund, Friedrich Maximilian Klingar*, by Emil Neubürger; *Goethes Leipziger Studentenjahre*, by J. Vogel, described in the sub-title as "a picture-book for poetry and truth"; *Goethe und Napoleon*, by Andreas Fischer; *Goethes Vater, eine Studie*, by Felicie Ewart; *Goethes Stellung zu Religion und Christenthum*, by Karl Sell. To these should be added a handsome souvenir volume of the poet's 150th anniversary, *Goethe, Eine Biographie in Bildnissen*, which consists of a folio volume of portraits, including 165 illustrations and a photograph of the oil-painting by Stieler, dating from 1828.

Drama.—Nothing is more noticeable, in contemporary German literature, than the almost exclusive cult which the chief writers are now making of the drama, at the expense of both poetry and fiction. Hermann Sudermann and Gerhart Hauptmann, whose pre-eminence among German writers of to-day is not likely to be called in question, have both definitely dedicated their genius to this special literary form; while many promising writers of lesser magnitude, who, like Arthur Schnitzler, owe their first success to the novel, are now tending to abandon fiction for the more alluring prospects which await a successful play. Sudermann, who began with a series of middle-class dramas, such as *Ehre, Heimat, Sodoms Ende*, and *Das Glück im Winkel*, all of them admirable for their convincing realism, followed them up, somewhat more than a year ago, with a work distinguished for its elevated style and wide historic outlook. This was the much-discussed tragedy, *Johannes*, which deals with the story of the forerunner of the Saviour. Sudermann has introduced into the character of the Baptist an element of dramatic conflict, and seeks the motive for his death not merely in the desire of Herodias for vengeance, in accordance with the biblical narrative, but more immediately in the prophet's sudden misdoubt of himself at the crucial moment. Just as his hand is raised to cast a stone at the princely pair and proclaim them unworthy to enter the temple, thus giving the signal for a revolt, the truth of a saying learned from the "carpenter's son," that love is higher than law and sacrifice, is borne in upon him, the stone drops harmless from his hand, and he is unresistingly taken captive by Herod's officers. In *Johannes*, Sudermann has symbolized the victory of faith over doubt; in his latest work, the fairy play, *Die Drei Reiherfedern*, he seeks to depict the opposition between desire and love. It is the endless delusion of desire which drives his young northern hero, Prince Witte, ceaselessly about the world, and when once he attains the object of his longings, it is a part of the tragedy of this delusion that he should never guess that the desire is attained, but should forsake the woman of his longings and continue his wanderings, until released by death. The lack of clearness and scenic effectiveness have caused the new play to be pronounced a failure; yet the more far-sighted critics find in it weightier evidence of the deepening of his art than in many of his pronounced successes. A like evidence of maturing power is to be seen in Hauptmann's great success of last year, *Fuhrmann Henschel*. The events in the play are exceedingly simple and are presented with wonderful clearness and simplicity. Henschel's wife, when dying, exacts a promise that he will not after her death marry the girl who is at this time in their service. Henschel, however, is a simple-minded person, who does what he thinks right without brooding over the matter. He has given his promise and his wife is dead. But his household cannot get along without a woman, his child needs a mother's care, the girl proves herself capable, so he marries her, after all. Destiny, however, pursues him; the new wife deceives him, makes his life a burden, and stirs up strife between him and his friends and neighbors. When at length he learns from his brother-in-law of her infidelity, and confronting her with the charge, finds that she has no

defence, the truth flashes upon him—either he or the wife must die. Suddenly his eye falls upon a piece of whipcord which he fancies he has not seen for years, and interpreting this to be the will of destiny, he hangs himself with it. To evolve from such humble material as is offered by these rude Silesian peasants a drama so full of human interest and so imbued with the relentlessness of fate is an achievement of art which quite dwarfs all the lesser plays of the past year. There are, however, a few young playwrights who deserve a passing word. Two of these are Viennese writers, Arthur Schnitzler and Hugo von Hofmannsthal. Schnitzler's recent work includes one long play, *Das Vermächtnis*, which was a distinct failure and several one-act pieces of genuine merit—among others, *Die Gefährtin*, which pictures the husband of a faithless wife, who learns her infidelity on the day of her funeral, and *Der Grüne Kakadu*, a fantastic caprice of the period of the French Revolution. Hofmannsthal's latest efforts are *Hochzeit der Sobiede*, described as a "fairy tragedy in two acts, suffused with all the coloring of the East," and *Abenteurer*, which is redolent of the spirit of eighteenth-century Venice. Both pieces proclaim him a true lyrist, with a passion for warm and brilliant colors. Other plays which attracted attention during the season of 1898-99 are Max Halbe's *Die Heimatlosen*; *Pauline*, by Georg Hirschfeld, and Max Dreyer's *Hans*.

Fiction.—While the present cult of the drama is drawing the best writers more and more from the other literary fields, the production of novels continues unabated; but as a natural consequence, there are few in the annual output of novels which deserve separate mention. Among the few exceptions is a little volume of short stories by Arthur Schnitzler, *Die Frau des Weisen*, which exhibits at its best his special skill in the delicate portrayal of moods. Lou Andreas-Salome is another writer who excels in subtle analysis of character, and especially in the interpretation of her own sex. Her latest volumes are *Fenitschka*, *Eine Ausschweifung*, and *Menschenkinder*. Wilhelm Raabe and Adolf Wilbrandt have each contributed new volumes during the year. *Hastenbeck*, by Raabe, is a story of the Seven Years' War, but the interest of the plot is feeble, and the critics point to it as evidence of failing powers. Wilbrandt's latest volumes are *Der Sänger* and *Vater Robinson*. The problem of higher education for women, which has encountered so much opposition in Germany, has given a theme for a number of striking stories by women during the past year, the most noteworthy of which are *Halbtier*, by Helene Böhlau, and *Wir Frauen Haben kein Vaterland*, by Ilse Frapan. *Halbtier* is distinctly revolutionary in tone, the author taking the ground that in the eyes of German men the German woman is "half a brute." The plot is distinctly unpleasant, the heroine being in constant rebellion against whatever impresses her as inequality between the sexes, and in the end she shoots down her brother-in-law, who has insulted her honor. Ilse Frapan's little volume is a pathetic little story of a young girl's struggle to satisfy her longing for a university education, and how the need of daily bread finally defeated her. Another story by the same author, *Die Betrogenen*, also deals with university life at Zurich; it may be briefly summed up as the relation of an experiment in free love.

The society novel plays a less important part in Germany than formerly. Its chief exponents to-day are Friedrich Spielhagen and I. R. zur Megede. Spielhagen's recent volumes are *Herrin*, which fell distinctly below his former level, and *Opfer*, which is about on the same level. Megede has given us this year another two-volume novel, *Von Zarter Hand*. Paul Lindau's *Agent*, which deals with a criminal case, and Rudolf Stratz's *Mont Blanc*, are both readable stories. Among the numerous historical novels of the year may be mentioned *Die Rächerin*, by Richard Voss, containing four novelettes of Roman times; *Lucius Flavius*, a romance of the last days of Jerusalem, by Joseph Spillmann, a ponderous volume, with copious citations from Josephus; and *Scolastika Bergamin*, by Hans Sittenberger, which the subtitle defines as "Eine Geschichte aus der Frankenzzeit," and which one critic pronounced "a work of art and a masterpiece in one."

Other volumes which deserve passing mention are *Die Macht der Stunde*, consisting of short stories by Paul Heyse; *L'ollmondzauber*, a mystical romance, by Ossip Schublin; *Roman aus der Dekadance*, by Kurt Martens, which in style is reminiscent of Garborg or d'Annunzio, while the plot suggests Zola's *L'Œuvre*; *Unter dem Katalpenbaum*, by Adolf Hausrath, in which the aged hero of the story goes to sleep under the shadow of the old nut-tree growing upon the "dream-bank" and re-lives in his sleep three separate former existences; *Die Sonne*, by Anton Frhm. vo Perfall, a symbolic novel, the sun being emblematic of the large city, whose fame stretches out like rays over the country and draws all things to it.

GERMAN SOUTHWEST AFRICA is a German protectorate on the west coast of Africa, north of the Orange River; estimated area, 322,450 miles; estimated population, 200,000 in 1897. Its general boundaries are Angola or Portuguese West Africa on the north, British South Africa or Rhodesia-Bechuanaland on the east, Cape Colony on the south, and the Atlantic Ocean on the west. Though cut off

from the interior of the continent by British South Africa, a narrow strip of territory extends eastward along the southern boundary of Angola to the junction of the Chobe and Zambesi rivers, near the Victoria Falls in Rhodesia. Four important rivers touch the territory of Southwest Africa, the Orange River on the southern boundary, the Cubanga, emptying through the Zambesi, and the Cunene entering the Atlantic on the northern boundary, and a river traversing the state and emptying into Walfisch Bay in the middle of the coast line. This bay is by far the best harbor along the 330 miles of coast line, but is possessed by the British, who had obtained the mouth of the river before the Germans acquired the country about. There are several other fair ports, however, including Sandwich Harbor, Lüderitz Bay, and the new harbor of Swakopmund, which is connected by railway with Windhoek. The latter, 180 miles east of Walfisch Bay, on the river, is the seat of government. The government is a protectorate under an imperial commissioner. Although the coast lands of the colony are sterile the interior is fit for cultivation did German enterprise allow its development. When it was first acquired, through purchase, by Herr von Lüderitz in 1883, there was a knowledge that a flourishing trade had formerly been carried on from the interior, among the articles which were brought out for export being ivory, ostrich feathers, gums, skins, and horns, all products of a primitive type, but indicative of a richer country than was generally supposed to lie behind the arid sand-dunes of the coast. Lüderitz died shortly afterward, but explorations in time showed the truth of his claims regarding the richness of the territory. As yet, however, little farming is being carried on, except for pastoral purposes. The chief imports are cotton goods, provisions, and mineral oils. In 1897 they amounted to \$1,187,426, coming from Germany, Cape Colony, and England; the exports are chiefly guano (which goes to England), hides, and ostrich feathers; they amounted in 1897 to only \$303,363, and went to the above-named countries. The northern districts are occupied by the Southwest Africa Company, an Anglo-German syndicate, which has a mining concession from Berlin and operates copper mines at Otavi. There is also the German Southwestern Africa Colonial Company, whose district consists mostly of the coast lands. In November, 1899, by reason of an understanding between the German government and the British South Africa Company, the latter agreed not to complete its railway from the British lands through German territory to the west coast of Africa, south of 14° S. latitude, except from a point on the Anglo-German frontier, to be agreed upon by the German government; and not to construct a road to the coast north of 14° S. latitude until a railway line had first been built through German Southwest Africa south of that degree. There has been a tendency among the Boers of South Africa, for some time, to emigrate into ports of German Southwest Africa, but they have been excluded by the Germans, who do not appear to realize that desirable settlers in the agricultural portions of the colony are among the things most needed at the present time. The Germans apparently fear that the Boers will not adopt German customs, and will become too powerful a foreign element to be submissive members of a German colony. There is little question, however, that they would develop the agricultural possibilities of the country, as shown by their conquest of the territory occupied in the great trek across the Vaal River from the British possessions.

GERMANY, in the north-central part of Europe, including the *Reichsland* of Alsace-Lorraine. The area is 208,830 square miles, and the population, census of 1895, is 52,279,901. Germany has 26 towns of over 100,000 inhabitants. The 7 largest are Berlin, 1,677,304; Hamburg, 625,552; Munich, 407,307; Leipsic, 399,963; Breslau, 373,169; Dresden, 336,440, and Cologne, 321,564. Among foreign nationalities in Germany there are nearly 3,000,000 Poles, who live mostly in eastern Prussia. About 13,500,000 Germans live in Austria-Hungary, Switzerland, and France. About 63 per cent. of the inhabitants are of the Protestant faith and 36 per cent. are Catholics.

Natural Products.—Agriculture is extensively carried on, and supports about 19,000,000 of the population directly. About 90 per cent. of the area of Germany is classed as productive, and includes arable, pasture, and forest lands. The principal crops are rye, hay, oats, potatoes, wheat, and barley; there are also hemp and flax, madder, wool, saffron, tobacco, hops, beet-root, the vine, and a variety of fruits and vegetables. The consumption of agricultural products in Germany is far above the production, so that the imports of this class are large. Germany's mineral resources are extensive, the greater part of the ores coming from the kingdom of Prussia. The principal minerals are coal, lignite, iron, zinc, potassic salts, rock salt, lead, and copper. Forestry is an industry of great importance, and is scientifically supervised and conducted by the state. About one-quarter of the Empire is covered with forests, from which there is a large annual revenue. See AGRICULTURE (paragraph Agricultural Teaching).

Manufactures.—Germany's importance as a manufacturing country is steadily increasing. It is estimated that in 1871 67 per cent. of the population were engaged in

agriculture, while in 1899 the figures were approximately reversed, about 67 per cent. being engaged in manufactures and commerce. In the iron and steel manufactures, Germany is one of the leading nations of the world, and in the manufacture of beet-root sugar it stands at the head of European countries. The chief industries include in addition the mining of coal, the manufacture of coke, machinery, seed oils, potash salts, the linen and woollen industries, and the production of beer. There are also manufactures of glass, porcelain, and earthenware, clocks, and woodenware. It is stated in a recent report on German commerce that, in spite of complaints of increased industrial competition abroad, of the stringency of competitive tariffs, and the growing cost of living at home, there is general prosperity and activity in all fields of German industry. An illustration of manufacturing progress is its recent development of industries in Crefeld, Elberfeld, Berlin, Chemnitz, and Leipsic. Again, the consumption of coal, a fair index of the health of manufacturing and trade, has increased for some years at an annual rate of between two and three million tons. German manufacturers have set up plants in Russia and many Russian industries are under German control. German industrial development during the past twenty years has been marked by a great concentration of capital and the formation of many large syndicates. These concerns have been criticised on similar grounds to those on which the objections to trusts in the United States have been based, but they seem to have had a favorable effect upon Germany's foreign trade, since they have been able, by keeping up home prices, to underbid the competitors in foreign markets. This concentration of capital is especially marked in the electrical industries. During the same period there has been an increase of wages, which, during the last ten years, are said to have risen 20 or 25 per cent., in response to the enhanced demand for labor.

Commerce.—The value of imports into Germany rose from \$1,159,060,000 in 1897 to \$1,296,148,000 in 1898; that of the exports, from \$901,380,000 to \$962,380,000. The principal items of German exports are textiles, metal and metal wares, cartridges, and percussion caps, "articles of consumption," chemicals and drugs, leather goods, machinery, etc. The principal countries receiving German goods in 1898 were, in the order of importance, Great Britain, Austria-Hungary, Russia, the United States, the Netherlands, Switzerland, France, and Belgium. Exports to the United States were considerably affected by the Dingley tariffs. Germany has risen to a rank second to England in commercial importance, and is at the present time putting forth the greatest efforts to increase her export trade. German capital plays an important part all over the world. German enterprises are very large in South America and China (*q. v.*), while in the United States the empire's capital in railroads alone is put down at \$180,000,000, and large amounts have been invested in manufacturing concerns, such as the Liebig company. The opinion has been expressed in the German press that the trip of Prince Henry of Prussia from Vladivostok through the Usuri country to Khabarovsk had some commercial significance. There is already considerable trade rivalry in eastern Siberia, especially between Germany, Belgium, and France. Germany has at present the advantage in trade. There are 82 German ships, aggregating 49,000 tons, heading the list of those plying between Vladivostok and Hong Kong, Shanghai, and Nagasaki. Exports to Denmark, however, suffered a considerable decline in 1899 owing to the expulsion of the Danes from Schleswig-Holstein. (See the article on DENMARK.) Among the causes of the industrial and commercial expansion in Germany may be mentioned the high point to which commercial education has been carried in that country, and the admirable system of technical and industrial education. The imperial government has also done much to promote foreign trade, and the efficient consular and diplomatic service is another factor. No countries have a better system for keeping the home merchants well informed as to the state of foreign markets. Wherever German trade goes there is sure to be an agency for distributing information as to trade conditions. As to the import trade, goods are brought by Germany from Great Britain, Russia, the United States, Austria-Hungary, France, Belgium, the Netherlands, and Switzerland, named in the order of importance. Over \$150,000,000 were spent for food articles alone. The principal imports from the United States show in a measure to what extent Germany is dependent upon this country for cereals, meats, and some of the essential raw materials. These imports, ranged in the order of their value as given in the trade statistics of 1898, are, in round figures, cotton, 191,000,000 marks; corn, 97,300,000 marks; wheat, 84,000,000 marks; lard, etc., 79,800,000 marks; petroleum, 59,700,000 marks, and copper, 56,700,000 marks; also meats, hides and skins, oil cake, lumber, and timber, rye, barley and oats, fresh and dried fruits, resin and turpentine, raw tobacco, machinery, and less important articles, including bicycles, butter, and pig-iron.

Trade with the United States.—The United States is fast building up a trade in Germany in finished industrial products, especially in machinery. The great increase of American imports into Germany is said to be giving manufacturers and producers more concern than almost any other question, owing to the high quality

and in general the lower price of American goods and products and their consequent effective competition in the German home market itself. In regard to the agricultural imports, a recent economic publication which has had a wide circulation in Germany, declares that the competition of this country is more to be feared than that of any European nation, owing to the superior agricultural and commercial methods of the Americans. A tariff sufficient to protect the German farmers is regarded as a necessity. The restrictions placed upon American meat, on account of the alleged presence of tuberculosis germs, is, according to various United States Consular Reports for 1899, due to ignorance of the efficacy of our inspection laws, but in some trade circles of this country it is claimed that these restrictions are really of a retaliatory nature. The inspection of California fruits for the purpose of detecting the presence of the San José scale also affected the importation of this class of goods, but these restrictions were largely removed late in 1899. The imposition of larger tariffs on American industrial goods has been delayed by opposition among retailers and dealers, but it is reported that measures of common defence against American competition is being steadily urged by the various industries in the iron and steel, wire, machinery, bicycle, and similar industries. Already the members of the German bicycle manufacturing association have decided to refuse credit to all dealers who handle American wheels. The 15 per cent. increase of foreign-made machinery in 1897 was mostly due to the increase of American manufactures. In 1897 the latter amounted to 30 per cent. of the English imports. In 1898 they were 60 per cent., a rate of increase which will soon place the United States first as a foreign competitor in the German market. The remarkable industrial development of this country is also threatening German trade in other parts of the world, especially in Japan, China, and Australia.

German Shipping.—It is estimated that while the German foreign trade has increased 60 per cent. during the last twenty-five years, the German merchant marine has more than trebled. According to the latest statistics as to the world's shipping, Germany had in 1899 a total tonnage of 2,465,387, of which nearly 2,000,000 tons represented steam vessels. The vessels of all classes numbered nearly 4000. Germans point with pride to the fact that some of the largest and fastest vessels, for example, the *Kaiser Wilhelm der Grosse*, were built in German ship-yards. In this respect Germany leads, having at least 20 steamships with a tonnage of 10,000 tons and upward, to 9 such vessels for Great Britain. This is said to be due to the stimulus given by mail and other subsidies.

Trade Policy.—In order to maintain the national trade supremacy, German political opinion will, no doubt, soon settle or compromise upon one of the three main questions of foreign trade policies which have been advanced. The first, held by the Agrarians, favors the establishment of a more strict protective policy in regard to meats and cereals, and would put an end to the concessions granted by commercial treaties. The second, held by the industrial group, favors the lowering or abolition of the duties upon foreign meats and breadstuffs, in order to lower the cost of production in manufactures. The third, held by the commercial group, such as the dealers and retailers, advocates free trade and the extension in every possible way of foreign commerce.

Colonies.—All of Germany's colonies have been secured to her since 1884, and embrace in the aggregate an area of considerably over 1,000,000 square miles, with a population approximated at 10,000,000. Several additional groups of dependencies, made up of islands in the Pacific, were added to her possessions in 1899. The most important of her colonies are in Africa, and include Togoland and Cameroon, on the Gulf of Guinea; German Southwest Africa, farther down the coast, and German East Africa, on the eastern coast. In 1899, by a convention between Great Britain and Germany, the neutral zone in the hinterland of Togoland and the British Gold Coast was divided anew, the greater part falling to Great Britain as a compensation for her relinquishment of control in Samoa. By the same treaty and for similar reasons Germany ceded to England the Tonga Islands, lying to the south of Samoa, including the Vavau and Savage Island groups, and also the islands of Choiseul and Isabella in the Solomon group. The ending of tripartite control in Samoa by Germany, Great Britain, and the United States resulted, upon the retirement of England, in the acquisition by Germany of the islands of Savaii and Upolu, while the United States received the important island Tutuila. Besides these islands, Germany added to her colonial possessions by purchase from Spain the Caroline, Pelew, and Ladrone, or Marianne, groups in the Pacific. In the latter archipelago the island of Guam, having been acquired by the United States in the Spanish-American war of 1898, was excepted in the German purchase. The other German dependencies in the Pacific are the Bismarck archipelago, Kaiser Wilhelm's Land, on the island of New Guinea, or Papua, the Marshall islands, and the remainder of the Solomon group. Finally there is the recent acquisition of the Chinese harbor of Kiaochau, with certain rights over the adjacent territory. The acquisition of

the island territories is a step in line with the German Emperor's policy of providing stations for the growing German navy and for the benefit of the empire's extensive foreign trade. The government has recently given special attention to its large and important African possessions, and is encouraging their development as a source of supply for the mother country.

Railways, Waterways, etc.—The canalization of the country is being steadily carried forward on a large scale. Besides 5831 miles of navigable rivers, there are at the present time about 1400 miles of improved river-ways and a still greater length of artificial waterways. On August 11, 1899, the Dortmund-Ems Canal was formally opened by the German Emperor. This canal, about 150 miles in length, starts at Emden, on the North Sea, utilizes the river Ems for a part of its length, passes through Münster, and terminates for the present at the village of Herne, in Westphalia, Dortmund being connected at Henrichenburg by a 9-mile branch. The canal will accommodate vessels of 600 to 700 tons burden, and is expected to give a considerable impetus to the industries of this part of Germany. It is the government's purpose to make Emden a first-class naval port, to deepen the river-bed, and build naval dry docks and ship-yards. It is expected that the Elbe-Trave Canal will be completed in 1900. The construction of the Rhine-Elbe Canal was strongly urged by the Emperor, but the bill providing for it was on August 17, 1899, rejected by the lower house of the Prussian diet. (See paragraphs on History.) Another ship-canal was recently proposed to connect Leipsic with Reisa, the grain centre of Saxony. The cost was estimated at \$12,000,000, including connection with the Pleisse, and improvements of the harbor in Leipsic, the length being 42 miles. The Main-Danube, the Rhine-Rhone, the Rhine-Marne, and many other canals, ramify through the country, and connect with foreign waterways.

The railways of Germany are owned mostly by the imperial or state governments, and had a mileage in 1896-97 of 29,461; the aggregate length of telegraph lines at the same period was 85,243.

Finance.—The main sources of revenue for the empire are customs and excise duties, federal contributions, and the posts, telegraphs, and state railways. The budget estimates for 1898-99 were, for revenue, 1,412,886,000 marks, and for expenditure, 1,441,579,000 marks. Of the above estimated revenue, 762,332,000 marks were raised by customs, excise, and stamps. The federal contributions are levied according to the population at a certain rate, fixed each year in the imperial budget. The public debt in 1898 was equivalent to £113,063,000. The monetary unit is the mark, which is equivalent to \$0.238 United States. The monetary system is gold monometallism.

Navy.—According to the uniform classification of the 1899 publication of the United States Navy Department on naval progress abroad, the German navy consisted, as reported in July, 1898, of 9 battle-ships, and 5 building; 3 armored cruisers, and 2 building; 7 protected cruisers, and 8 building; 21 unprotected cruisers, 19 coast-defence ships, 2 torpedo vessels, 1 torpedo-boat destroyer in course of construction, 113 torpedo boats, and 9 building, and 1 ship for special purposes. The new naval programme begun in 1898 was the result of the extraordinary efforts of the Emperor. Under it the strength of the fleet will be reached by 1903. In 1899 there were 4 large and 13 small vessels laid down with a tonnage of 51,324. The number of vessels under construction during the year were 19 large and 19 small vessels, with a tonnage of 148,235. There were launched 1 battle-ship, 1 cruiser, 1 gunboat, and 1 torpedo-boat destroyer.

Army.—The army reorganization was completed early in 1898, up to which time the peace-footing, by the law of August 31, 1893, had been 479,229 men, and a slight increase was made. In March, 1899, by a new army bill, the peace-footing was increased by about 16,000 non-commissioned officers and men, some 7000 less than proposed by the government. The full strength will be attained by 1903. The mobilized strength of the army is, according to estimates made in 1898, nearly 4,000,000 men.

Emigration.—According to the report of the United States commissioner-general of immigration, there came to this country in 1898-99, 26,632 German immigrants, of which number 17,476 came direct from Germany. The latter figure shows an increase of 365 over the number emigrating from Germany to the United States in the preceding year. By far the larger part of German emigrants have come to the United States, but the number of all emigrants is annually decreasing. In 1881 it was 210,547; in 1887, 99,712; and it has declined rapidly within the last decade, dropping off 50 per cent. within the past three years.

HISTORY.

The Lippe-Deimold Affair.—The question of the Lippe-Deimold succession has been pending since 1897. At the beginning of 1899 it was still an important subject of discussion. The Prince of Lippe-Deimold being incapable of ruling, a regency had been established and two claimants had appeared—namely, Count Ernest of

Lippe-Biesterfeld and the reigning Prince of Schaumburg-Lippe. The King of Saxony, who had been chosen as arbitrator, declared in favor of Count Ernest as regent, whose right was recognized by the rival claimant. The question now arose whether the regent could transmit the throne to his children. This was denied by the Prince of Schaumburg-Lippe. The diet of Lippe-Detmold had declared the children of Count Ernest the legitimate successors. Appeal was taken to the federal council, which rendered a preliminary decision of importance on January 5. The council declared itself competent in the matter, although it refused the request of Schaumburg-Lippe to prevent the Lippe-Detmold legislature from regulating the succession. There was much difference of opinion as to the right of the federal council to interfere when a question of succession arose in one of the states. Such interference was opposed by both Liberals and Federalists, the former on the ground that it was an invasion of the rights of citizens, and the latter that it intrenched upon the authority of the states. Appeal was made to the *Reichstag*, but the imperial government defended the action of the federal council.

Colonial Expansion.—By a treaty with Spain, dated February 12, and ratified by both governments in June, Germany acquired the three Pacific archipelagos of the Carolines, Ladrões or Mariannes, and Pelews, all that remained of Spain's colonial empire in that part of the world. The purchase price was 25,000,000 pesetas (about \$5,000,000). Spain reserved the right to a coaling station in each group, and certain of her interests in the islands were safeguarded. The price paid by Germany was regarded by some as excessive, but seemed on the whole a good bargain, since while the islands have little value in themselves, their situation was such as greatly to strengthen Germany's position in the Far East—a matter of importance in view of Germany's aspirations in China. Another important acquisition in 1890 was that of the greater part of the Samoan group (see SAMOA). It was estimated that Germany would spend about \$8,000,000 for her colonies in 1899, and, in spite of the enthusiasm which the policy of colonial expansion aroused in some quarters, it was not generally received with marks of favor. The purchase of the Carolines seemed to be regarded with indifference, and there was some disappointment in connection with Kiao-Chau, which, though reputed one of the most healthful stations in the East, was found to be exceedingly unhealthy to the German colonists.

Expulsion of Aliens.—The irritating policy of Prussia, noted in the last YEAR BOOK, in expelling aliens from Silesia, Westphalia, and Schleswig-Holstein, aroused bitter criticism not only in foreign countries, but at home. The Danes, who were expelled in large numbers, were admitted by the authorities to be inoffensive members of the lower classes, but their removal was justified on the ground that their employers were trying to strengthen the Danish influence in certain districts. The too severe comments upon this policy which Professor Hans Delbrück (*q. v.*), the historian, ventured to make, resulted in a reprimand and the imposition of a fine. The minister of education demanded the transfer of Professor Delbrück to another Prussian university, and on March 25, 1899, he was reprimanded and fined 500 marks.

Measures Before the Reichstag.—The most important matters discussed by the *Reichstag* were the army bill, the bill for the renewal of the Imperial Bank charter, and the anti-strike bill. The army bill came near causing a political crisis. It provided for the progressive increase of the peace-effective until in the course of the fiscal year 1902 it should reach a total of 502,506 men, and it also made certain changes in the disposition of the existing forces. The *Reichstag* showed a determined opposition to the increase of the effective, and was willing to grant only 495,500 men, which number should be reached in the year 1903 instead of 1902. A compromise was effected on March 16, but with the understanding that if the grant should prove inadequate the government should be free to make new proposals before the expiration of the five-year period. Thus, in 1903 the German army will have attained a peace effective of 495,500 men. The law extending the privileges of the Imperial Bank for twenty years was passed on April 28. Under this law the Imperial Bank obtains the power to determine the discount rates of private banks of issue. The anti-strike bill came up for discussion in the *Reichstag* on June 19. In his speech on the subject of this proposed law in 1898, the Emperor had represented it as being more severe than it really was. It was designed to punish the promoters of strikes. In its original form it did not impose a penalty upon all such agitators, but only upon those who instigated a strike that compromised the safety of the empire or one of the German states, or jeopardized life and property. It provided that whoever tried by force, threats, outrages, or bribes to involve employers or workmen in any understanding for the purpose of making a change in labor or wages should be liable to fine or imprisonment, and the same penalty was to be imposed upon any one convicted of using these means to cause the dismissal of workmen or the abandonment of work in order to cause a lockout or strike. The general purpose of the measure seemed to be to protect workmen against employers

WILLIAM II., GERMAN EMPEROR AND KING OF PRUSSIA.

as well as employers against workingmen. Both Liberals and Social Democrats opposed it, the latter nicknaming it the "Penal Servitude Bill." It passed its first reading, but finally was rejected, the *Reichstag* refusing even to send it to a committee (November 20).

The Canal Project.—The most serious parliamentary conflict of the year occurred in the Prussian *Landtag* in August in regard to the government's canal project. This was to connect the Elbe with the Rhine by a canal. There was already the canal from Dortmund to the Ems, which was formally opened in August by the Emperor in person. It runs from north to south and establishes by means of the river Ems communication between Dortmund and the sea. The proposed canal was to consist of two parts, the first running from the Rhine to Dortmund and forming a right angle with the Dortmund-Ems Canal; the second, which was much more important, was known as the centre canal (*Mittellandkanal*), and was to start from the Dortmund-Ems Canal a little to the north of Dortmund and run in an easterly direction until it met the Elbe. Thus the two great rivers of Germany would be united, and since there is already a system of canals east of the Elbe, the result would be a complete network of water communication throughout the empire. It would greatly cheapen transportation from the coal and iron districts of Westphalia to the industrial centres of the Rhine and Elbe. This was a favorite project of the Emperor, who, while reactionary in many of his ideas, has always shown himself progressive in matters of commerce and material welfare. But it encountered violent opposition from the first. It was essentially a measure for commercial and industrial improvement, and as such became an object of suspicion to the Agrarians and Conservatives. They considered their own interest endangered. Besides this, the Silesian members were against it, since they thought the coal-beds of Silesia would suffer from the competition of the Rhine and Westphalia if the canal were carried through. The opposition consisted of the Conservative Right and a part of the Catholic Centre, while the Liberal Left and some of the Catholics supported it. Other members offered their support only at the price of certain concessions on the part of the government. The *Landtag* appointed a committee to consider the bill, and after an investigation this committee reported against it. In the course of his speech at the opening of the Dortmund-Ems Canal the Emperor declared that he would leave nothing undone to secure the adoption of this measure. After a lively discussion in the *Landtag* the bill for the branch connecting Dortmund with the Rhine was lost by a vote of 212 against 209, and the centre canal was lost by a vote of 228 against 126. It was still hoped that on the third reading a compromise might be reached whereby the government would secure the passage of one branch and leave the pressing of the other portion of the measure to a more convenient time. But the Liberals did not favor this and preferred to vote against both parts rather than to accept so small a portion of it. Accordingly, on the third reading, the project for the Dortmund-Rhine Canal was lost by a vote of 275 to 134, and that for the centre canal by a vote of 235 against 147. Before the final vote Prince Hohenlohe had declared, in his capacity as president of the Prussian ministry, that the government would not renounce its project, but would bring it up in another session, and would then find means to cause its adoption. This affair occasioned much discussion, since it showed an opposition to the Emperor on the part of the very political parties upon which he was accustomed to rely in the *Landtag*. The defeat of the government was followed by some reprisals. The defeat was attributed in part to the half-hearted support or the secret opposition of certain official members of the *Landtag*. Some of these functionaries were placed on the retired list, the Conservatives fell into disfavor, and the ministers of public instruction and the interior were replaced. Herr von Miquel, minister of finances, was not disturbed, although it was commonly reported that he had intrigued secretly for the failure of the government's project. The Emperor's defeats on the anti-strike bill and the canal project were most humiliating, and the latter was regarded as especially significant, since it marked a rupture, for a time at least, with the Conservatives, or aristocratic landowners, who were his traditional supporters and the only party that looked with favor on his peculiar ideas of monarchic rule. These ideas had been expressed by the Emperor with renewed emphasis early in the year. In a speech at the banquet of the provincial diet of Brandenburg, on February 3, he referred to the services rendered by his house to Germany, and said the chief thing that made these services so brilliant was the fact that the members of his house had perceived that they were personally responsible to their ruler in heaven. He also referred somewhat vaguely to enemies of his imperial house, and implied his intention to deal with them severely.

Foreign Relations.—The unfavorable comments in the German press on the United States during the Spanish-American war had caused some bitterness of feeling in the latter country, and at the close of the war it was rumored that the German government had designs on the Philippines. In view of the bad effect which these

rumors had in the United States, the Berlin government found it expedient to make a public declaration in regard to the matter. Secretary of State von Bulow, replying to an interpellation in the *Reichstag*, on February 11, declared that the rumor of German designs on the Philippines was utterly false, and, again, on February 28, referred in his speech before the budget commission to the importance of maintaining friendly relations with the United States. As to The Hague conference, the Germans were not sanguine, and it is probable that the Emperor expressed the general sentiment when he declared that while the peace project of the Czar was a magnificent undertaking, those who counted on it would be disappointed of its success so long as original sin continued among mankind. The general relations of Germany with foreign countries were friendly throughout the year. The Emperor's visit to Great Britain (*q. v.*) and his interchange of courtesies with the French (see FRANCE) were construed as marking closer relations with each of these powers. On November 4, a German embassy, presided over by Prince Albert of Prussia, arrived at Madrid for the purpose of bestowing the Order of the Black Eagle upon the young king, Alphonso XIII. On November 20 the Czar visited the Emperor of Germany, having gone to Darmstadt to visit his wife's parents. Much political speculation was occasioned by these international courtesies, and their significance was greatly exaggerated in the press. On March 11, Mr. Cecil Rhodes obtained an audience from the Emperor in regard to the railway and telegraph line from the Cape to Cairo, and it was soon afterward announced that a treaty, permitting the running of the telegraph line through German territory had been signed. There was no official notice of any agreement as to the railway project. Important international arrangements in which Germany took part were the settlement of the Samoan question, whereby Germany secured the larger part of the group and Great Britain renounced her rights to any portion of the islands (see SAMOA), and the delimitation convention with Great Britain in respect to the hinterland of the Gold Coast and Togoland (*qq. v.*). Toward the close of the year the German press comments on the war in South Africa showed great bitterness and hostility toward England, but this had no effect upon the official relations between the two powers.

The New Civil Code.—The work of preparing a new German civil code, which was begun in 1874, has been completed, and the new system becomes effective on January 1, 1900. The new code is based largely on national law and is only in part of Roman origin. It has been compiled chiefly from provincial legal systems, especially from those of Prussia and Saxony. Thus, the long conflict between the Roman law of the empire and the native law of the German states has ended with the triumph of the latter. The scientific perfection of the Roman system appealed strongly to the jurists of the sixteenth and seventeenth centuries. During the next two centuries, however, the native law gained ground and native codes supplanted the Latin code of Rome in several of the states. At the same time the study of the *Corpus Juris Civilis* continued, and during the nineteenth century was productive of important scientific results. Thus, the actual practice was divorced from the scientific theory, since the native codes were local in their application and did not reflect the intellectual life of the nation as a whole. The formation of the German Empire in 1871 opened the way to the compilation of a single national code. This new code has been described as reflecting fully the modern spirit. The paramount importance of commercial interests is recognized by this code, which regulates all matters of exchange. The merchants of Germany have long demanded an imperial code, since in all their relations it was essential that a uniform system of commercial law should be employed. A recent writer says: "Briefly speaking, therefore, the new code embodies the rights of the individual and governs the financial relations throughout the empire. Such is its content; hence, its thoroughly mercantile spirit. . . . Not the farmer nor the nobleman is considered; only the legally eligible subject, the abstract unit of the *jus gentium* being here in evidence. This unit or person appears in but one capacity—either as creditor or as debtor; and this conception may be truly said to embody the highest ideal of the merchant." The code guarantees the liberty of the individual and recognizes his right to dispose of property and incur indebtedness. It does not recognize any forms of ownership that are not absolutely free. One of the characteristic features of the code is the protection which it accords to the *bona fide* possessor of property. The *bona fide* purchaser is insured in possession even when the seller was not the actual owner. In fact, throughout the code it is the *bona fide* third person whose rights are always regarded. The code institutes a system of real estate records which shall be at all times accessible to public examination. Claims not registered in this record are invalid, and those which are so registered are recognized as legitimate. Any one who purchases from a person whose name is registered in the record is legally entitled to the property, whether or not the name inscribed is that of the real owner. Thus, the matter of technical justice is ignored in favor of the *bona fide* third party.

Another instance is the law governing the right of inheritance. A so-called certificate of inheritance is given to the adjudged heir to an estate, and any one purchasing *bona fide* from the person named in this certificate is protected in his purchase, whether or not the person there named is the actual heir. Again, the *bona fide* holder of negotiable paper acquires the right to it in all cases without regard to the will of the debtor, but only to the form itself. For example, a hundred-mark note stolen and put in circulation by the thief is valid so soon as it falls into the hands of a *bona fide* third party. In these and other cases it is apparent that the interests of exchange are always regarded. The aim is always to facilitate exchange.

This applies to transactions indirectly involving the liability of the debtor. In the other class of transactions—namely, those which directly involve the liability of the debtor—the law is based on an entirely opposite principle. This is the principle of faith and belief. The chief object in view is the protection of the debtor, who is to be required to pay nothing beyond what is deemed necessary and reasonable. In all contracts of this kind exceptional authority is given to the court, which is not bound by the express wording of the contract, but whose decision is superior both to the letter of the law and the express terms of the contract. The aim is not to secure abstract literal justice, but to apply the principles of equity to the case. If a judge finds that the contract contains unreasonable terms, he may pronounce it invalid. If the penalty imposed for a breach of contract seems to him excessive, he has the right to reduce it. In the case of contracts which involve the exploitation of another person, or show an intention of taking advantage of another's necessity, the court may declare their terms null and void. A complete safeguard against usury is here provided. The civil code is supplemented by the law regulating its introduction, which provides that the existing imperial laws affecting private rights shall not be impaired by the provisions of the code. Many of the provincial laws continue in force. These are agrarian in character.

Other Events.—Among the important acts of legislation during the year was the revision of the law of insurance for workingmen. This widened the scope of the law, increased the pensions, and introduced the principle of voluntary insurance for certain classes of workingmen. Trade laws were reformed in order to improve the condition of employees in large stores. One of the most significant features of the political history of the year was the new spirit which showed itself in the Social Democratic party, which appeared to be veering toward a Radical or Liberal position in politics and away from the doctrinaire attitude of the strict disciples of Karl Marx. (See SOCIALISM.) The party was strengthened by the departure of the government from its policy of singling out the Social Democrats for especial repression. Chancellor Hohenlohe promised the repeal of the old law, which had been revived against the Social Democrats, and which prohibited their forming political organizations such as were freely admitted in the case of the other parties. There was considerable progress in higher education during the year. Polytechnic institutions were established at Jena and Dantzic. But the government showed an irritating tendency to interfere with university instruction on what seemed to many frivolous grounds. Besides the case of Professor Delbrück, noted above, another instructor was suspended because he was a Social Democrat, and still another was reprimanded at the instance of the Emperor for parodying for political purposes a verse of the Book of Job. The woman's movement for the improvement of women's opportunities for the higher and technical education made some progress. In January the government announced that departments of dentistry, pharmacy, and medicine should be opened to women. At the University of Giessen women were admitted to courses in philosophy and law, and in the University of Strasburg they were admitted as hearers. The movement for establishing *gymnasien* for girls was carried on with success, and several of these institutions were established. The one hundred and fiftieth anniversary of Goethe's birth was celebrated throughout Germany on August 25, but chiefly at his birthplace, Frankfurt, and at Weimar, where he died. See the article GERMAN LITERATURE.

GIRLS' FRIENDLY SOCIETY IN AMERICA, founded in England in 1875, has extended to all English-speaking countries, and numbering in 1899 in all parts of the world 300,000 members, is a society of young church women and girls, which aims to encourage purity, dutifulness to parents, faithfulness to employers, and thrift. There are two classes of members—associates, who must be communicants of the Protestant Episcopal Church, and members, who may be of any denomination. The society was started in the United States in 1877, and had in 1899 a membership of nearly 22,000. The American society publishes the *Girls' Friendly Magazine*. President, Mrs. Thomas Roberts, Philadelphia, Penn.; secretary, Miss Eve Alexander, 659 West Lexington Street, Baltimore, Md. Central office, 281 Fourth Avenue, New York City.

GLACIAL GEOLOGY. Recent studies in the glacial geology of the driftless area of Wisconsin indicate that, after all, there was some glacial action in that region. W. Upham believes that most of the glacial drift of Illinois, Kansas, and a portion of Minnesota is of englacial origin. The existence of a glacial period in recent times has been doubted by few; it has been more difficult though to prove glaciation in earlier periods of the earth's history. Molengraf states that the Gwyka conglomerate of the South African Republic is of glacial origin, and considers that glaciation prevailed over a very large area, probably during a part of the Permian period, while C. H. Hitchcock has come to the conclusion that glaciers existed in many portions of Australasia during the Triassic period.

GLACIERS. The third annual report of the International Committee on Glaciers shows the following conditions: Swiss glaciers: retreating; Eastern Alps: some retreating, some advancing, others stationary; Scandinavian Alps: some stationary, others retreating; Caucasus: retreating; Turkestan: of the twenty-six glaciers lately discovered in the Talass mountain chain, the majority show a most rapid condition of retreat; the same is true on the chain of Peter the Great. In recent years five glacial centres have been discovered in the Altai Mountains. All are rapidly retreating. The inland ice of Greenland seems to be at a maximum, especially in the North. Several small glaciers still exist on the Wenatchee Mountains in Washington, while on the Cascade Mountains, within the United States, there are several hundred small glaciers. The glacier on Mount Iztaccihuatl, in Mexico, is advancing.

GOEBEL, WILLIAM, who became so conspicuous a figure in Kentucky politics as Democratic claimant for governor in the fall of 1899, was born in Sullivan County, Penn., in 1856, and went with his parents to Covington, Ky., when a boy. He was sent to Cincinnati to learn the jewelry trade, but abandoned this to enter the law office of Stevenson and Meyers in 1873. He became law partner of Governor John W. Stevenson and later of John G. Carlisle, and for many years was a prominent member of Democratic State conventions. His advent into politics was made as candidate for State senator to fill the unexpired term of J. W. Bryan, elected lieutenant-governor in 1887, and after that date Goebel represented Kenton County in the Kentucky legislature. Several years ago he shot and killed Colonel John D. Sandford; he was acquitted on the ground of self-defence. Mr. Goebel was the author of the election law recently passed by the legislature and still in force depriving county judges of their power to appoint election officials, and creating a board of three State commissioners (not necessarily from different parties), who appoint subordinate boards in the various counties. Also on the subordinate boards there is no requirement for minority representation. The unfairness of this measure, representative, it was alleged, of many of Goebel's political acts, operated against him in the exciting and bitterly contested campaign that followed. On the face of the returns, as reported, the Republican candidate, W. S. Taylor, was elected by a small majority, and on December 9 he was given the certificate of election. This decision, however, was not acquiesced in by the Goebel Democrats, and the matter was not definitely settled at the close of the year. See KENTUCKY.

GOLD. The following is the production of gold in 1898 as estimated by the director of the mint:

State or Territory.	GOLD.		State or Territory.	GOLD.	
	Fine ounces.	Value.		Fine ounces.	Value.
Alabama.....	242	\$5,000	New Mexico.....	26,074	\$539,000
Alaska.....	122,187	2,534,800	North Carolina.....	4,064	84,000
Arizona.....	119,249	2,465,100	Oregon.....	56,966	1,177,600
California.....	756,463	15,637,900	South Carolina.....	5,041	104,300
Colorado.....	1,123,073	23,195,300	South Dakota.....	275,723	5,699,700
Georgia.....	6,221	128,600	Tennessee.....	43	900
Idaho.....	88,055	1,716,900	Texas.....	14	300
Iowa.....	5	100	Utah.....	110,556	2,385,400
Maryland.....	29	600	Virginia.....	218	4,500
Michigan.....	5	100	Washington.....	37,065	776,300
Minnesota.....	5	100	Wyoming.....	257	5,300
Montana.....	248,014	5,126,900	Total.....	3,118,398	\$64,463,000
Nevada.....	144,869	2,994,500			

Gold production in foreign countries in 1898 and 1899 is reported as follows, the figures representing ounces:

Country.	1898.	1899.	Country.	1898.	1899.
New South Wales.....	341,372	409,100	New Zealand.....	280,176	283,292
Victoria.....	837,257	681,366	India.....	415,147	363,412
West Australia.....	1,050,179	1,389,046	British Guiana.....	113,070	91,278
Queensland.....	918,100	758,700	Transvaal.....	4,555,009	4,121,348
Tasmania.....	48,913	57,402	Rhodesia.....	24,581	55,343

A new gold region is reported—the Cape Nome area on the northern coast of Alaska. The excitement that has existed from time to time over the reported discoveries of gold in northwestern Illinois have led to an investigation with the results that while gold does occur there, still it is not at all in commercial quantities. Dunn describes the gold fields of eastern Siberia in the *Engineering and Mining Journal*, and *The Geology of the Coolgardie Gold Field* was issued by the West Australia Geological Survey. O. H. Hershey discusses the age and origin of certain gold deposits on the Isthmus of Panama. Other books are: J. E. Woodman, *Studies in the Gold-Bearing States of Nova Scotia*, Boston Society of Natural History, XXVIII., and W. B. Begeer, *The Metallurgy of Gold on the Rand*. A new process of gold extraction consists in the use of permanganate of potash as the active or exciting agent in the necessary chemical reactions, while chlorine serves as the solvent. The process is not yet beyond the experimental stage, and possesses some drawbacks. Von Gernet shows the loss of gold in solution from the mills in the South African district.

GOLD COAST, a British West African colony on the Gulf of Guinea, with a coast-line of 350 miles and an area of about 15,000 square miles for the settlement proper and about 46,600 square miles including the protectorate. Population, about 1,500,000, of which only 150 are Europeans; chief towns, Accra, 16,267 inhabitants; Elmina, 10,530; Cape Coast Castle, 11,614. The colony was founded by a chartered company, was transferred to the crown in 1821, became a separate colony in 1874, and included in its sphere of influence in 1895-96 the protectorate Ashanti, whose king made a formal submission to Great Britain as the result of an expedition against the capital Kumasi. The hinterland of the Gold Coast was involved in the Franco-British controversy, which in 1897-98 affected much of that part of Africa, and which is fully treated under Niger Territories (*q. v.*). The resources of the colony, though considerable, have been little developed on account of lack of communication and an unhealthy climate. According to the British colonial report of 1898, there has been a recent increase of trade. The cultivation of cocoa and coffee is on the increase, and the gold-mining industry, in which there are good prospects, is expected to receive an impetus by the completion of a government railway, now building from Secondi, on the coast, to the mining districts in the neighborhood of Tarquah. At the present time it is very difficult to transport the necessary machinery inland to the mines. A railroad has recently been completed from Accra to Kumasi by way of Insuaim, and another from Takoradi Bay to Tarquah. Roads also have been constructed from the chief coast centres to many points of the interior, and are expected to play almost as important a part as the railways in the development of the country. The total imports of the Gold Coast in 1897 amounted to \$3,816,251, and included dry goods, clothing, spirits, provisions, tobacco, and building materials. The exports were valued at \$4,174,450, and comprised gold-dust, rubber, palm oil and kernels, timber, coffee, cocoa, monkey skins, and cola nuts. The increase in the total trade over 1896 was \$349,512. The greater part of the trade is with Great Britain.

GOLDEN GATE PARK MUSEUM. See ANTHROPOLOGY IN AMERICA.

GOLF. Two important advances in the American game of golf resulted from the annual meeting of the United States Golf Association. These were, first, a sensible adjustment of the questions affecting the amateur and the framing of more stringent rules defining his status, and second, a broadening of the scope of the association by a recognition of sectional divisions and championships. In pursuance of the second idea there have been voluntarily established the Metropolitan Association, the Connecticut League of Golf Clubs, the Pittsburg League, the Associated Golf Clubs of Chicago, the Central New York Golf League, and the Western Golf Association. The principal tournaments of the year were as usual the amateur championship, Chicago, July 3-8; the open championship, Baltimore, September 14-15; the women's championship, Bala, near Philadelphia, October 10-14, and the intercollegiate championship, Garden City links, L. I., October 24-28. The amateur championship was won by H. M. Harriman, 3 up, 2 to play, who defeated last year's champion, Findlay S. Douglas, in the final round. Harriman's play was in general brilliant, and his

success emphasized the widespread rise of the native-bred player during 1899. There were 112 entrants. The fifth annual open championship, with 79 entrants, was won by William Smith, of Chicago, with a total of 315 for the 72 holes. Among the final 8 competitors were all the previous champions—Dunn, Rawlins, Foulis, Lloyd, and Herd, and also H. M. Harriman. The women's championship furnished one of the surprises of the season. Seventy-nine entrants played over an 18-hole course of 5420 yards. Miss Beatrix Hoyt, three times champion, lost to Mrs. Caleb Fox in the qualifying round, and Mrs. Fox lost to Miss Ruth Underhill in the final round, the latter having 2 up, 1 to play. The long drive was won by Miss Marion Oliver, Albany, with a drive of 164 ft. 8 in. In the fourth intercollegiate championships Harvard won as follows: Princeton beat Yale 11-7, Harvard beat Columbia 29-0, Harvard beat Princeton 21-2. In the individuals Charles Hitchcock, Jr., Yale, made 80 as the best score in the qualifying round, which makes a competitive record. The individual intercollegiate championship was won by Percy R. Pyne, Princeton, who defeated J. G. Averill, Harvard, by 1 up in a 37-hole match. Pennsylvania was admitted to membership in the Association, and will play in the next championships. The growth of golf and of country clubs continued throughout the country in 1899, a marked tendency being the development of winter golf in the South, especially in Florida, and on the Pacific coast. More public links were laid out also in city parks. At Princeton the importance of golf was recognized by the awarding of the 'varsity letter to Percy R. Pyne. The importance of the game was similarly recognized at Yale in 1898.

GOOD TEMPLARS, INDEPENDENT ORDER OF, originated in central New York, in 1851, and in 1859 adopted a platform declaring for total abstinence, no license, and absolute prohibition. The International Supreme Lodge held its thirty-ninth session in Toronto, Can., June 27-July 4, 1899. The reports showed that there were 81 grand lodges and 37 subordinate lodges in the world, with a membership of 403,287, besides a juvenile branch membership of 172,839. R. W. G. Templar, Joseph Malins, Birmingham, England; R. W. G. secretary, B. F. Parker, Milwaukee, Wis.

GORDON, Sir CHARLES ALEXANDER, K.C.B., M.D., surgeon-general in the British army, retired, was born in 1821 and died September 30, 1899. After entering the army he served with the Sixteenth Lancers in the Gwalior campaign, at the battle of Maharajpore, and in the expedition to the west coast of Africa against Apollonia in 1847-48, having become a surgeon in 1846. He took part in the Indian mutiny campaign in 1857-58, and received the decoration of C.B. and other honors for his services at the siege and capture of Lucknow. In 1860 he became deputy surgeon-general, participated in the China expedition, and from 1862 to 1867 was the principal medical officer of the British forces in the Calcutta and Benares commands. Having been sent in 1870 as a medical commissioner to the French army, he was in Paris during the siege and bombardment of that city by the Prussians. In 1874 Dr. Gordon became surgeon-general, and for the next five years served in the Madras presidency. In 1876 he was made honorary physician to the Queen. He received a special reward for his military services, and was retired in 1880, and in 1897 was created a K.C.B. The following are among his publications: *Army Hygiene; Army Surgeons and Their Works; China from a Medical Point of View; Experiences of an Army Surgeon; The French and British Soldier; Hygiene and Surgery of the Franco-Prussian War; the Soldier's Handbook of Sanitation; Life on the Gold Coast; The Island of Madaira; Our Trip to Burmah; Recollections of Thirty-nine Years in the Army*, 1898.

GORMAN, ARTHUR PUE, Democratic United States senator from Maryland, who retired from service on March 4, 1899, was born in Howard County, Md., March 11, 1839. He was educated in public schools, and from 1852 till 1866 served as a page in the United States Senate. From 1866 till 1869 he was a collector of internal revenue for Maryland; in 1866 he became a director of the Chesapeake and Ohio Canal Company, of which he has been president since 1872. From 1869 till 1875 he was a member of the Maryland House of Representatives, and was its speaker in 1873-75. In 1875-81 he was State senator, and in 1881 was elected to the United States Senate, where he served until 1899, when he failed to be returned. Senator Gorman's last act in the Senate was to lead the opposition in its attempt to defeat the peace treaty ratified on February 6.

GOWING, RICHARD, English journalist, died January 12, 1899. He was born at Ipswich, county Suffolk, in 1831. After serving on various newspaper staffs in Ipswich, Birmingham, Exeter, and London, he accepted the editorship of the *School Board Chronicle*, which position he retained from 1873 to 1894; from the former year to 1877 he was also editor of the *Gentleman's Magazine*; and from 1877 to the time of his death he was secretary of the Cobden Club, the well-known London free trade organization. In 1896 he edited *Richard Cobden and the Jubilee of Free Trade*;

among his writings are: *Public Men of Ipswich and East Suffolk*, 1875; *Richard Cobden*, 1885; *A Pilgrimage to the West; Canada and the United States*, 1897.

GRADE CROSSINGS. See RAILWAYS (paragraph Grade Crossings).

GRAIN ELEVATORS. In exterior aspect the modern grain elevator is a windowless rectangular structure surmounted by a cupola-like superstructure. The main body of the building, called by elevator men the "house," is mostly occupied with bins for the storage of grain, while the surmounting structure, which is generally three stories high and is called the "cupola," contains the operating machinery and working rooms. Generally the topmost story of the cupola contains the leg driving machinery and turn-head spouts, the middle story the garnerers, and the lowest story the weighing hoppers and cleaning machines. Below the cupola and main roof and extending over the entire width and length of the house is the distributing or spout floor. Here are the conveyers for transporting lengthwise of the building, and the distributing spouts for transferring by gravity from the scale hoppers to the bins. By means of the legs reaching from the bottom of pits sunk below the foundations of the bins to the topmost story of the cupola, and containing bucket conveyers, the grain is elevated to the turn-head spouts and discharged into garnerers. From these it passes to the lower floors, where it is weighed, cleaned, if desired, and finally spouted to its proper bin.

In the past the almost universal construction of grain elevators was of timber, sometimes with thin brick outside protecting walls for the house and corrugated iron covering for the roof and cupola walls. This incombustible outer covering was employed essentially as a protection against fire from the outside. For this purpose it was of course a better construction than unprotected wood, but the building being structurally destructible by fire when it once gained access to the inside or when it started inside the building, the fire risk was nevertheless very great, and insurance rates were very high. This condition of affairs has led during the last two years to the construction of elevators which were structurally fire-proof or slow-burning. In the great Northern elevator, built at Buffalo, N. Y., cylindrical steel bins are substituted for the wooden bins of the old construction. The walls of the house are of brick, and the framing and covering of the cupola are of steel and iron. The floors consist of steel plates laid on steel beams and joists. All fixtures are of metal, electric lights are employed, and everything is designed to reduce danger and destruction by fire. The capacity of the elevator is 2,525,000 bushels, the bulk of which is provided for by 30 steel bins 15½ feet in diameter. In the elevator "Electric," of 1,000,000 bushels capacity, also located at Buffalo, N. Y., the plan of separating entirely the operating and storage departments has been adopted. All the operating, including elevating, weighing, cleaning, etc., is done in the operating house, which is a steel frame iron-covered building. The storage is effected in hermetically tight steel cylinders, located near by, but separate from the operating house. The grain is transferred to the storage tanks from the operating house by pneumatic conveyers. Several other elevators of practically the same construction as the "Electric" have been built at other places. The most important of these is located at Fort William, Ontario, which has 16 tanks 58 feet in diameter and 60 feet high, placed in two parallel rows, and 32 tanks 29 feet in diameter and 60 feet high, placed in two parallel rows between the two rows of large tanks. In the new "Fitchburg" elevator at Boston, Mass., which has a capacity of 1,000,000 bushels, the attempt has been made to secure fire-proof construction while retaining the wooden-bin construction of former practice. The construction adopted is practically the steel framework and fire-proof floor construction used for modern fire-proof tall buildings. See TALL BUILDINGS.

GRAND ARMY OF THE REPUBLIC. First organized in 1866, the first national encampment having been held in November of that year. In June, 1899, there were 6905 Grand Army posts, and 287,081 members distributed in 45 departments. National encampment for 1900 to be held at Chicago, Ill. Commander-in-chief, Albert D. Shaw (*q. v.*), Watertown, N. Y.

GRANGE, NATIONAL. PATRONS OF HUSBANDRY, an association of farmers, formed in 1866, has for its objects the following reforms: Postal savings banks, food laws, rural free mail delivery, additional powers for the Interstate Commerce Commission, speedy completion of Nicaragua Canal, prevention of pooling of railroads, investigation of foreign trade relations, election of United States senators by popular vote, and international arbitration. There are 27,689 subordinate granges in 44 States and Territories. Master, Aaron Jones, South Bend, Ind.; secretary, John Trimble, Washington, D. C.

GRAPHITE. Corrected returns show that the production of graphite in the United States in 1898 amounted to 2360 pounds of crystalline material and 890 short tons of the amorphous graphite. The production of the former is the largest on record. Most of the supply came from Ticonderoga, N. Y., and Chester County,

Penn., while Clay County, Ala., yielded a small amount. The manufacture of artificial graphite from coke has met with much success. The process consists in subjecting the coke to as high a temperature as is obtainable in the electric furnace, the result being that the carbon of the coke is principally converted into graphite, although this change may be affected by the presence of such impurities as silica. An elaborate description of the graphite deposits of Ceylon has been published by Diersche. The graphite occurs in gneiss, and is quarried by natives. An amount valued at about £430,000 is exported annually. E. Weinschenk has issued *Der Graphit, sein wichtigsten Vorkommenisse und seine technische Verwerthung*.

GRAVES, CHARLES, D.D., D.C.L., Bishop of Limerick, died July 15, 1899. He was born in Dublin, November 6, 1812; was educated at Trinity College, Dublin, in which institution he was a fellow from 1836 to 1866, and professor of mathematics from 1843 to 1862. In 1860-66 he was dean of Chapel Royal, Dublin, and president of the Royal Irish Academy in 1861-66; also in 1864-66 he was dean of Clonfert. In the latter year he was advanced to the bishopric of Limerick. Bishop Graves was a fellow of the Royal Society. His publications include: Two geometrical memoirs (1841)—*General Properties of Cones of the Second Degree and Spherical Conics*; *Suggestions with Respect to the Publication of the Brehon Laws*, 1851, and two episcopal charges, 1867 and 1869.

GRAVING DOCK. See DRY DOCK.

GREAT BRITAIN and THE BRITISH EMPIRE. The area of the United Kingdom of Great Britain and Ireland is 120,979 square miles, with a population, according to the last decennial census in 1891, of 38,740,180 (estimated in 1899 at 39,800,000). Estimates as to the area and population of the colonies place their extent, in round numbers, at 11,250,000 square miles, and the number of inhabitants at about 344,000,000 (estimated at 414,000,000 in 1899). The number of British in the United Kingdom in 1897 was estimated to be 39,500,000, with 10,500,000 British in the colonies. Details in regard to the various possessions of Great Britain may be found in the separate articles on the British colonies, protectorates, and dependencies. A recent report of the United States Treasury Department gives the following area and population of the British possessions, grouped under several great land divisions:

	Area, Square Miles.	Population.
India and feudatory states.....	1,800,258	287,223,431
Europe.....	121	196,889
Asia.....	147,377	5,076,422
Africa.....	2,514,760	39,875,520
America.....	3,614,338	6,882,960
Australasia.....	3,173,558	4,793,900
In the Pacific.....	10,000
Total	11,250,412	344,069,122

Mineral Products of the United Kingdom.—The principal minerals, named in the order of importance as to the value of the amount produced in 1897, are coal, iron, slates, sandstone, clays, limestone, salt, oil-shale, granite, basalt, lead, tin, chalk, gypsum, and zinc. The most important non-metallic mineral is coal, of which 202,129,931 tons were raised in 1897, an increase of nearly 7,000,000 tons over the previous year, and 202,054,516 in 1898. The principal coal fields are in Durham, Yorkshire, Lancashire, Staffordshire, and Derbyshire, in England; Glamorgan, in Wales, and Lanarkshire, in Scotland. In iron about 13,787,878 tons were produced in 1896, the value being £3,217,795. The exports of coal are quite large, being about 37,000,000 tons in 1897, but iron ore exports are insignificant. (See, however, paragraph on Manufacturing.) On the other hand, there were imported during the first six months of 1899 about 3,640,000 tons of iron ore, most of which came from Spain. The position of England as a manufacturing centre makes necessary not only all her large home production, but a constantly increasing amount of foreign ore. There were in 1897, 380 blast furnaces in operation, and 21,327,013 tons of ore were smelted. British tin, of course, is famous the world over.

Agriculture.—Permanent pasturage occupies the largest acreage of the productive area of Great Britain and Ireland, the next largest being grain crops, and the next clover and grasses and green crops. The acreage in 1898 was in Great Britain as follows: Grain crops, 7,400,335; clover and grasses, 4,911,189; green crops, 3,133,521. The yield of wheat, 73,029,000 bushels, and of barley, 68,051,918, were the largest recorded; and the oats harvest, 118,920,917, is said to have been exceeded only twice. Experiments made in sugar-beet growing resulted in an average yield of

19 tons 17 cwt. per acre, a good showing, since the average for Germany and France was only about 11.12 tons. The year 1899, according to an estimate published in the United States Consular Reports for November, 1899, was, on the whole, a poor one for the stock farmer and the dairyman and for the grazing interests, and only a moderate one for the corn grower. Owing to drouth and other causes, the amount of hay for 1899, estimated at 7,537,000 tons, was 2,500,000 tons below the crop of 1898, and about 550,000 tons below the average for the previous ten years. Wheat was a good average crop, while barley and oats were but moderate.

During the last ten years agricultural conditions have been closely studied with a view to ascertaining the causes of depression. A number of official reports have been published on the subject and have called attention to some very important facts. It has been shown that the decline in agriculture has not only closed an important source of revenue, but has resulted, on a large scale, in the transfer of the population from the country to the cities—a transfer which has overburdened the charitable agencies of the latter. In a recent publication it is shown that the per capita cost of the poor law relief was \$131.25 in London as compared with \$64 in England and Wales, and that although the number of paupers in England and Wales has decreased since 1874, the cost of their maintenance has nearly doubled. And besides these indirect results of the bad state of agriculture, the farmers themselves have suffered greatly, owing to the shrinkage in agricultural prices and the decline in rural values. As to the landowner, he is apparently worse off than the farmer. An important feature of the changed conditions of agriculture is the transfer of arable land to pastoral purposes. It is estimated that the low price of grain led in 1895 to the abandonment of over 500,000 acres of grain lands. In 1898 a large part of this, about 220,000 acres, was reapplied to grain-producing purposes, but the pastoral lands still remain the larger part of the productive area. In 1898 53½ per cent. of the cultivated lands in England were pastoral, 68½ per cent. in Wales, and 28½ per cent. in Scotland, making an average of 51 per cent. for all Great Britain. Although lands used for pastoral purposes have increased, the production of animal food has not increased in proportion. It is estimated that the number of cows is less per thousand than in 1875. Meats and milk products show a comparatively slight increase in domestic production, while the importation has more than doubled in each case. In 1898 the foreign meat produce was one-third of the total as against one-fifth of the total twenty years before. In the face of this growing dependence upon foreign food products, it is not strange that the maintenance of a strong navy should be regarded as a vital necessity. It is a fact which perhaps explains the recent movement to make the cereals contraband of war. It is said that the condition of agriculture has shaken the confidence of investors in securities based upon agricultural land. It is certain that capital values have greatly depreciated. Unfortunately, the tax valuation has not taken due account of the declining value of agricultural land. The agricultural depression is, of course, due primarily to the sinking of prices on account of the improvement of transportation and the competition of new districts. Under present conditions there is slight chance of accumulating capital for improvements on the land, since the landlord gets practically no return corresponding to economic rent and barely receives a sufficient return to yield a low rate of interest on his investment. It is even feared that the pressure which is brought to bear upon the tenant farmer may tend to bring in the rack-renting system, reducing him to the level of the Irish tenant of former years. If this happened, it would be due wholly to conditions over which the tenant had no control, and not to any incapacity on his part, for the tenant farmers of Great Britain are regarded by many as among the best farmers in the world.

Manufactures.—Statistics of British manufactures in 1899 were not available, and it is only from the figures of her foreign trade, especially those showing the imports of raw materials and the exports and imports of manufactured goods, that her industrial condition can be determined. Among the raw materials imported, two of the most important are wool and cotton. In 1898 about 2,128,000,000 pounds of cotton were brought in, nearly all of which was used in manufactures. Wool imports were about 812,000,000 pounds, half of which amount came from Australia; of the total wool imports, about equal amounts were reshipped and retained for home manufacture. Other raw materials imported for the use of textile manufactures are flax, hemp, jute, silk, etc. Altogether about 5,000,000 persons were in 1899 dependent upon the cotton, woollen, and linen industries, the aggregate capital of the concerns which employ them being in 1899 nearly \$1,000,000,000. (See COTTON AND THE COTTON INDUSTRY.) Besides textiles, Great Britain manufactures and largely exports cutlery and other metal wares; iron and steel manufactures, especially machinery and mill-work; earthen-ware, and other articles, which have long been famous as of British make. In the production of pig-iron Great Britain formerly led with an output of 50 per cent. of the world's supply; at the present time the United States is in the lead with one-third the world's annual output, but Great

Britain still produces nearly a quarter of the total amount. In 1899 the production of pig-iron was 9,309,000 tons, an increase of about 700,000 tons for the year. The year 1899 was a remarkable period for iron and steel industries throughout the world, there being a greatly increased output of ore, together with a still greater demand for the product, and high prices for ore, pig-iron, and the iron manufactures. The world's output of pig-iron increased by nearly 4,000,000 tons, reaching 39,848,867 tons; the output of ores increased by nearly as much again, and fully 2,000,000 tons were added to the production of steel. These figures, given in a recent publication of the United States Treasury Department, show that the enormous increase of pig-iron is largely due to the development of the United States, and that the British increase is proportionately small. In recent years Great Britain's manufacturing trade has been threatened by the great industrial growth of Germany and the United States, not only in the world at large, but in the United Kingdom itself. In explanation of this it has been alleged that the British manufacturer does not avail himself of the latest improvements in machinery; that the British mechanic is not now as technical as the American and the German mechanic, and that the labor market is continually being disturbed by strikes and lockouts. The United States Consular Reports state, however, that British manufacturers are becoming more enterprising in using up-to-date plants (the machinery coming largely from the United States), and that technical schools are being opened in most of the manufacturing towns. A significant fact in connection with the latter movement is the endowment by Andrew Carnegie in 1899 of a technical college in Birmingham University, to be carried on along the lines of the best American engineering schools. It may be added that the notable increase during 1898 of American exports into Great Britain was chiefly in manufactures. Important articles were electric elevators, locomotives, and machinery, the large orders for which aroused considerable protest in England. These orders were undoubtedly due in part to the fact that British engineering works were already overcrowded with work, and one of the things urged by the American consuls in England is that United States manufacturers should send over only their most finished stock. In 1899 English manufacturers were much excited over the award of the Athara Bridge contract in Egypt to an American concern. In this case the Englishmen were hopelessly underbid, both as to price and the time of delivery. See EGYPT.

Ship-building in Great Britain.—If Great Britain is at present the most important manufacturing nation, she is much more a leading country in mercantile-marine ship-building. According to the United States Consular Reports for June, 1899, the total ship-building output of this class for the world in 1898 is estimated at 1,893,000 tons, of which 1,367,570 tons gross were launched in the United Kingdom. The number of vessels was 761, of which only 17 were sailing vessels. In addition to these, there were launched in the United Kingdom 41 war-ships with a tonnage of 191,555. There were under construction also at the close of 1898, 584 vessels of 1,401,087 tons gross, not including war-ships being built. Not a single new vessel added to the British registry in 1898 was of foreign construction. The large volume of orders placed with British ship-yards has involved the employment of other important concerns, and the estimate has been made that work was thus furnished in 1898 to the engineering and electrical industries generally to the value of at least £5,500,000, and not less than £5,000,000 to iron and steel manufacturers. By the same estimate the total value of mercantile ship-building completed in 1898 was £20,000,000, and that of war-ships for British and foreign navies, including guns and other equipment, amounted to an equal sum. It was expected that the ship-building business for 1899 would be considerably greater even than that for 1898. Of the tonnage of 1,893,000 launched last year in British yards, 1,131,000 were under Lloyd's survey, and early in 1899 there were being constructed under Lloyd's survey about 1,186,000 tons of vessels. Among these new vessels a number of the largest were being built for the transatlantic trade, with Liverpool as the British port. According to recent statistics, the value of ships built in British yards for foreign registry during January and already delivered was \$2,649,623; in February the value was \$906,455. The launching of the *Oceanic* for the White Star Line in January has been commented upon as restoring Liverpool to its former position of being the home port of the largest ship in the world. It is not generally known that the *Oceanic* was largely built of American steel plates, the supplying of which to British ship-builders has become a permanent trade.

Commerce.—The total imports of the United Kingdom in 1898 were £470,604,198, a gain of about £20,000,000 over 1897, and of nearly 22 per cent. within a decade. The principal items of import, in the general order of importance, are grain and flour (about two-thirds of wheat and wheat flour from United States), raw cotton (two-thirds from United States), wool (largely from Australia), and sheep, meat, sugar, butter, timber, flax, hemp, jute, tea, etc. Of the countries from which Great Britain imports, the United States is far in the lead, with a value of goods for the

year 1897 of £113,042,000; then follow France, £53,347,000; Holland, £28,971,000; Germany, £26,190,000; Russia, £22,284,000; Belgium, £20,886,000; Spain, £13,126,000, and Denmark, £10,968,000. The export trade of Great Britain was in 1898 about £233,390,792, a slight decrease below that of 1897. In addition, there were about £60,000,000 exports of foreign and colonial produce. The chief items of British export are woollen and worsted goods, iron and steel wares, linen and jute manufactures, machinery, etc. The countries to which exports are sent are, according to 1897 statistics, first, Germany, receiving goods valued at more than £21,600,000; second, the United States, nearly £21,000,000, and third, France, about £13,819,000. Then follow Holland, Belgium, and Russia, approximately £8,000,000 each, and Turkey, about £6,500,000; Japan, Italy, Brazil, and China, about £5,500,000 each; Argentine Republic and Egypt, about £4,500,000 each, and Sweden, Spain, and Denmark, approximating £3,500,000 each. As to British colonies receiving exports from the mother country, India took in round numbers over £27,380,000; Australia, £21,311,000; British North America, £13,666,000, and South and East Africa, £5,476,000. The United States has in recent years given way to Germany as the largest buyer of British goods, the falling off of British exports to this country being generally attributed to the American tariff.

The foregoing comparative statistics will give a good general idea of the condition of British trade at the present time. Complete statistics for 1899 were not available, but it may be said that business in Great Britain was, broadly speaking, in a very satisfactory condition, in spite of the war with the Transvaal in South Africa. Imports showed a steady increase, their value for the year ending October 31, 1899, being £487,763,325, as compared with £465,865,460 for the similar twelve months in 1897-98. The largest increase was in the importation of metals and raw materials for various industries. Less American copper than usual was brought in, owing to the high prices which prevailed on that metal. An important result was the opening up of new British mines, especially in the copper regions of Australia. One other principal import showed a falling off in 1899—namely, raw material for the textile industries, especially jute and wool, owing mainly to a shortage of supplies. As to exports, the value for the twelve months ending with October, 1899, was £258,637,517, which is a gain over the previous twelve months, as compared with a slight loss during the calendar year 1898. Coal exports increased, France's purchases increasing by one-third, and Germany and Brazil also buying more freely. The year was one of unusual activities in the iron and steel trade, exports increasing in pig-iron, hardware, and cutlery, machinery, locomotives. The export of bicycles continued to rapidly decline during 1899, the decrease being over 30 per cent., and the tin-plate shipments showed a general falling off, which became marked in the case of the United States, which now produces tin plates in large quantities. Cotton goods declined on the whole, though this country took twice as much cotton yarn and twist as in 1898. As to the total United States trade, British exports to this country in the calendar year 1899 were, according to United States Treasury Reports, \$142,321,497, a gain for the year of \$31,022,664, as compared with a loss in 1898 of \$47,703,483; and imports from the United States amounted to \$509,958,335, a gain of \$28,799,692, as compared with a gain in 1898 of \$56,063,003. The large balance of all British imports over British exports is largely caused by the small purchases and the large sales of the United States in Great Britain. The result is a growing concern in England over American rivalry. A like agitation is now going on among manufacturers in Germany (*q. v.*), where conditions are somewhat similar. Great Britain's merchant marine in 1899 included 70 per cent. of the steamers of the world. At the beginning of the year it numbered, according to Lloyd's, about 20,400 vessels, with an aggregate gross tonnage of 13,368,853. The number of steam vessels was 8835, with a tonnage of 10,816,310. Four lines, the Cunard, Peninsular and Oriental, White Star, and Canadian Pacific, receive subsidies from the government, in return for which certain of their vessels are available to Great Britain as reserve cruisers in time of war. The total subsidy granted is £48,600 annually.

Navy.—According to the uniform classification of the 1899 publication of the United States Navy Department on naval progress abroad, the British navy, as reported in July, 1898, consisted of 52 battleships, and 12 building; 18 armored cruisers, and 8 building; 95 protected cruisers, and 24 building; 16 unprotected cruisers; 15 coast defence ships; 35 torpedo vessels; 50 torpedo boat destroyers, and 46 building; 98 torpedo vessels, and 3 ships for special purposes. The total displacement of built vessels, exclusive of torpedo boats, was 955,000 tons, or 1,000,000 tons estimated for 1898-99. The vessels to be built or completed between 1898 and 1903 include 16 battleships, 30 cruisers of various classes, and 4 gunboats. The total tonnage of all English cruisers now (1899) under construction is, according to United States Navy Reports, greater than that of the cruisers, contemplated or building, of all the remaining European powers. The vessels to be built during 1898-1903 alone are superior in power to the total German navy in 1903. The tonnage of these same new vessels

exceeds the total tonnage of the war vessels of the United States Navy, built and building, by more than 100,000 tons displacement. It is the announced policy of Great Britain to make her navy equal in strength to the navies of any other two European powers. In 1899, 21 large and 14 small vessels were laid down, with a tonnage of 247,900. The total number under construction during the year was 49 large and 51 small vessels, with a tonnage of 531,680. There were launched, in 1899, 6 battleships, 1 cruiser, and 5 gunboats, the royal yacht, and 3 torpedo boat destroyers.

Army.—On January 1, 1899, the various ranks of the British army were distributed as follows: At home, 106,686; Egypt, 4257; India, 74,466; colonies, 37,363, in addition to 7242 local forces. This was greatly changed during the year, owing to the war in South Africa, and the drafting of troops from England, India, and elsewhere. The total number of troops sent to South Africa up to the close of 1899 was about 65,000. The total cost of the army in 1898-99 was £19,220,500. The estimate made for 1899-1900 was £20,617,200, but this will be greatly increased by the war. The total of the regular army, together with its reserve, militia, and volunteers, amounted to 665,000 on January 1, 1899. The first-class army reserve numbered nearly 79,000 well-disciplined men. This branch of the service was called out by proclamation in October for the mobilization of a large field force. This is said to be the first experience of real mobilization in Great Britain.

Education.—There were registered at the beginning of the year 1899 at the institutions of higher learning in the United Kingdom about 24,500 students, the total teaching force being 1596. The universities of Cambridge and Oxford are among the most famous in the world, as well as among the oldest, though they were founded at a later date than some of the continental universities. Cambridge, with its 19 corporations or colleges, has a teaching staff of 122, and a student body of over 3000. Oxford, with 23 colleges, has a teaching force of 91, and an attendance of about 3500. In Scotland are the four noted universities of Aberdeen, Edinburgh, Glasgow, and St. Andrews. In Ireland is the University of Dublin. Two educational questions in England which were prominent in 1899 were, first, the reorganization of London University, hitherto only an examining body, with power to grant degrees; and second, the establishment of a Birmingham university, which shall have as one of its foremost branches the teaching of commercial education in all its branches. The new London University will become a teaching body, and it was settled during the year that it will be housed in the buildings of the Imperial Institute, for the purchase and alteration of which the sum of £60,000 has been granted by Commons. The Birmingham University had received subscriptions during the year of more than £225,000, including a large gift from Andrew Carnegie for a technical college founded on American lines. By the incorporation of the present Mason College also the sum of about £200,000 in endowments will become available. Secondary education is entirely unorganized except in Scotland, where school boards administer the burgh schools. According to the latest trustworthy statistics, which cover the United Kingdom, there were (August 31, 1897) about 19,960 elementary schools inspected in England and Wales, with accommodations for 6,215,199 pupils. About 9000 elementary schools were reported in Ireland in 1897, and in Scotland were 3086 schools, with accommodations for 843,769. Primary education is receiving more attention than formerly. The agitation in favor of instituting various reforms resulted in 1899 in provision that after April 1, 1900, primary, together with secondary and technical education shall be under the sole control of a board of education, which shall take the place of the present Education Department and that of Science and Art, the president to be appointed by the Queen, and to be eligible to a seat in Commons. There will also be a consultation committee, two-thirds of whose members shall be qualified to represent the universities and other educational bodies. There is a separate department for Scotland. The department in Ireland is under the Commissioners of National Education, Dublin. Cost of school administration, 1896: England and Wales, £398,910; Scotland, £49,149. A second act of 1899 was that known as the Half-Timers act, which will take effect on January 1, 1900. It requires that children must attend school up to the age of 12 years at least.

Finances.—During the year ending March 31, 1898, the amount of public revenue collected was £106,614,004, and the national expenditure was £102,935,994, leaving a surplus for the year of £3,678,010. In 1898-99 the income was £108,336,193, and the expenditure £108,150,235, leaving a balance of £185,858, a large decrease in the surplus. The budget for the year 1899-1900 estimated that the revenue would be £110,287,000, on the basis of taxation then existing, and the expenditure £112,927,000, leaving for the first time in some years an estimated deficit the amount of which was £2,640,000. To meet this deficit additional duties were in 1899 imposed on imported wines, which were estimated to produce £420,000, and alterations made in the stamp duties to produce an increase of £450,000. To reduce the expenditure the amount of £2,000,000 was deducted from the sum annually set aside for the service and redemption of the national debt. The final budget for 1899-1900 then showed an estimated

revenue of £111,157,000 and an expenditure of £110,927,000, leaving a balance of £230,000 for contingencies. Sir Michael Hicks-Beach, in commenting upon the new budget, said that the rapidly increasing expenses of the government were mainly due to increased armaments, and that however great the prosperity of the country might be it was impossible to meet such increases by a mere automatic increase of existing taxation, nor could they be met for long by any increase of existing taxes. The discovery of new and productive sources of revenue must be found. Unusual causes caused a still further rearrangement of this budget, owing to supplementary estimates of £278,000 made by the House of Commons, in July, and the unforeseen expenditure of £10,000,000 for South Africa, bringing the total expenditure of the 1899-1900 budget up to £121,205,000. Owing to unlooked-for increases in the revenue also the chancellor of the exchequer estimated an additional income of \$3,000,000. He proposed to provide the balance necessary to meet the war expenses by a temporary loan, to be charged to the national debt fund. Further war expenses should be paid in part, he thought, by the invaders of British colonies in Africa, when the war should be brought to a successful termination. The conduct of the exchequer came in for some severe criticism, especially the reduction of the funds set apart for the payment of the debt. The national debt amounted on March 31, 1899, to £598,966,831 net. This amount is the growth of many years, and was mostly raised for foreign wars. During the last ten years it has been annually decreased by from five to eight millions. The decrease in 1899 was £6,873,119.

HISTORY.

Parliamentary Sessions.—The regular session of Parliament opened on February 7, 1899. On the eve of the session Sir Henry Campbell-Bannerman was chosen as Liberal leader of the House of Commons to replace Sir William Vernon Harcourt, who had withdrawn from the leadership in the latter part of the preceding year. The relative strength of the political parties in the House of Commons was as follows: Conservatives 337, Liberal Unionists 66, giving a total Unionist vote of 403; Liberals 184, anti-Parnellites 71, Parnellites 11, giving a total opposition, counting in the speaker, of 266. Thus, the Unionist majority in the House was 137. The Queen's speech was, as usual, mainly taken up with a review of political events. In conclusion, it promised the introduction of a large number of bills, including among others the provision for agricultural and technical instruction in Ireland, for the relief of the tithe rent-charge payers, for a board of education for England and Wales, for a local government bill for London, and for aiding the occupants of small dwellings in the purchase of their homes. Among the principal measures passed during the session, which closed on August 9, 1899, were the following: The London Local Government bill, which provided for a better local government for the administrative county of London by dividing it into boroughs, each with its own mayor, councillors, and aldermen; the Tithe Rent-Charge act, which exempted the owner of a tithe rent-charge from the payment of one-half existing rates; the Colonial Loans act, which granted a credit of £3,351,000 to 17 crown colonies; an act placing the West African territory, administered by the Royal Niger Company, under the control of the imperial government; the Small Houses act, which empowered the local authorities to advance money to a resident in any house within the area for the purpose of enabling him to acquire the ownership of that house; the Board of Education act, establishing a board of education for England and Wales. In the autumn the critical state of affairs in South Africa necessitated the calling out of a reserve to strengthen the military forces of the country, and a special session of Parliament was decided upon. The autumn session lasted from October 17 to October 27, and its main work was the passage of the Consolidated Fund act and the Treasury Bills act. The former appropriated the supplies voted for the army, and applied the sum of \$10,000,000 out of the consolidated fund for service during the year ending March 31, 1900. The latter authorized the issue of treasury bills to raise any sum not exceeding £8,000,000. During this and the preceding sessions the parliamentary debates were of the greatest importance, but the points developed in them can be better brought out in a separate discussion of the important topics of the year.

Church of England.—The ritualistic controversy, which began in 1898, assumed a political form in consequence of the sharp criticism of the ritualistic movement in Sir William Vernon Harcourt's letters to the press. The matter became the subject of an important debate in Parliament. Mass meetings were held in January and February, 1899, and petitions were presented to the crown to enforce the obedience of the clergy to their officers and to the laws of the Church. The lawlessness of the clergy was discussed in Parliament, and finally a resolution was adopted to the effect that Parliament deplored this spirit of lawlessness, and expressed a hope that the ministers of the crown would not recommend any clergyman for preferment unless they were satisfied that he would loyally obey the bishops, the prayer-book, and the law as declared by the courts which have jurisdiction in matters ecclesiastical.

tical. The outcome of what the newspapers called "the crisis in the Church" was an inquiry before the Archbishops of Canterbury and York as to the ritualistic practices in the Church. This began at Lambeth Palace on May 7. On September 30 the decision was announced. It pronounced the liturgical use of incense and the carrying of lights in procession as neither enjoined nor authorized by the Book of Common Prayer, and it asserted the obligation of clergymen to use the forms prescribed by the prayer-book. The archbishops, while saying that these practices might not in themselves be unsuitable for divine service, held that it was their duty to request the clergy to discontinue them. The Tithe Rent-Charge act, by which the government exempted the owner of a tithe rent-charge attached to a benefice from payment of one-half the rate, and supplied the other half out of the imperial funds, aroused a vigorous opposition and attracted especial attention on account of the controversies in the Church. It was condemned by the Liberals on the ground that it really meant a fresh endowment for the Church of England, but passed the Commons on July 20.

Irish Affairs.—The distress of the people in certain districts of Ireland led to a motion by Mr. Davitt in Parliament for the enlargement of holdings and the carrying out of feasible schemes of migration, but these measures of relief did not meet with approval and were voted down. The usual motion for legislative independence for Ireland was made after the reading of the address. Mr. Redmond declared that the demand of the people for legislative independence had been intensified by the establishment of local self-government. The motion was voted down by a large majority. Elections of the county and district councils under the new Irish Local Government act were held in January and April, the suffrage being for the first time granted to women. About 70 per cent. of the qualified voters took part in the elections. The result was a complete victory for the Nationalists, who secured five-sixths of the seats. As explained in the last YEAR BOOK, the new system practically gives Ireland home rule in local affairs. The chief object of the Irish demands in 1899, in addition to complete legislative independence for the whole country, was the establishment of a Roman Catholic university. A project for such a university was outlined by Mr. A. J. Balfour. On June 23 the question arose in Parliament, and Mr. Balfour again argued on behalf of the new university. It was characterized by Sir Charles Dilke as part of a plan "to kill home rule with kindness," to which an Irish member replied that the better educated the Irish people become the more intense would be their desire for home rule.

Relief of Poverty.—There was much discussion of charitable measures, both in Parliament and in the press. A Poor Law act was passed extending the powers of poor law guardians in cases where parents are dead or unable to perform their duties, and giving them the right to assume control over such deserted or orphaned children until the latter reach their eighteenth year. Several Old-Age Pensions bills were introduced into the Commons, and were referred to a select committee to consider and report on the best means of improving the conditions of the aged and deserving poor. This committee reported that a system of old-age pensions was practicable, and that in their opinion the attempt should be made on the basis of a scheme which they outlined. The minority report, drafted by Mr. Lecky, pronounced against it. For a general discussion of the subject see the article OLD-AGE PENSIONS. A bill authorizing local officers to provide cottage homes for the deserving poor, the qualifications for admission being that the applicant should be at least sixty-five years of age and needy, and should have led an industrious and deserving life, was reported favorably by the committee, the report urging that the aged and deserving inmates in workhouses should constitute a special class and enjoy special privileges, and "that guardians should provide special cottage homes within the unions, or other suitable accommodations, for married couples and respectable old persons whose poverty is not their own fault, but the result of misfortune."

Foreign Relations and Imperial Affairs.—The chief event in the foreign relations of Great Britain during the year was the settlement of the Fashoda difficulty by the convention of March 21, 1899, between Great Britain and France. This convention, the terms of which will be found under the article FRANCE (paragraphs on History), delimited the claims of the respective powers in the valley of the Upper Nile. An important agreement was reached with Russia on April 28. By this each government agreed not to seek on its own account, or on behalf of its subjects, any railway concessions in the sphere of influence of the other—that is to say, the British government engaged not to interfere north of the Great Wall, and Russia, on her side, agreed not to interfere in the basin of the Yang-tse. The agreement concluded with the declaration that the two parties had no intention of infringing on the sovereign rights of China. (See the articles CHINA and RUSSIA.) Toward the close of the year there were rumors of important negotiations between Great Britain and Russia in regard to certain demands of the latter power in connection with the

Russian advance in Central Asia. (See the article *AFGHANISTAN*.) With Germany Great Britain entered into an important agreement in regard to Samoa, renouncing the British rights in the islands, and ceding to Germany the British territories, with the consent of the United States. (See *SAMOA*.) On November 20, Emperor William visited Queen Victoria at Windsor Castle, and this was taken by many as a sign of closer relations between the two powers, and as having something to do with a general Anglo-German agreement. It is not clear, however, that the visit had any political significance apart from the natural effect of promoting a greater spirit of friendliness between the two powers. Mr. Chamberlain, in his speech of November 30, spoke of a new alliance which should include England, Germany, and the United States, but this reference was not taken seriously. The visit did much to remove the unpleasant impression created in England by the Emperor's famous despatch to President Kruger at the time of the Jameson raid. With the United States, the chief matter of discussion was the Alaskan boundary, which was at one time the occasion of much ill-feeling on the part of Canada and the United States, but which seemed likely to reach a satisfactory settlement toward the close of the year. (See *ALASKAN BOUNDARY DISPUTE*.) As to The Hague conference, the speech from the throne referred to the sympathy of the British government with the objects of the conference, and its intention of being represented at The Hague. The co-operation of the British and American representatives at the conference aided in the carrying out of some of its important practical objects. (See *HAGUE CONFERENCE*.) As to the events in the outlying parts of the empire, they are more properly included in the articles on the British colonies and dependencies, and the present article will refer only to certain aspects of imperial affairs. The great centre of interest from the beginning to the close of the year was Africa. In the early part of the year it was announced that a convention had been concluded between the representatives of Great Britain and Egypt, giving the latter power the control over the Soudan. A discussion of the proposal to bestow money and honors upon Lord Kitchener and the others who had distinguished themselves in the Egyptian campaign, brought out some severe criticism in Parliament, based on Lord Kitchener's alleged brutality at the Mahdi's tomb. The remains of the Mahdi had been removed from the tomb and destroyed. The justification alleged for this was the necessity of preventing the tomb from becoming a shrine and the focus of fanaticism. Before the close of the year the last vestige of the Mahdi's power was overthrown in the Soudan by the defeat of his successor, the Khalifa, who was killed in the action. (See articles *EGYPT*, *FRANCE*, and *SOUDAN*.) Another important event in Africa was the transfer of the administrative powers of the Royal Niger Company over West African territory to the crown. This company had been most successful as a trading company, and had comprised within its control an area of 600,000 square miles, with a population of about 30,000,000. The preamble to the Royal Niger Company act, effecting this transfer of power, praised the company for its work as a civilizing agent, stating that it had put down slave-raiding, had abolished the legal status of slavery, and checked the trade in spirits with the natives. The effect of the act was to reduce the company to the status of a mere trading company. But the all-absorbing topic of the year was the crisis in South Africa and the course of British relations with the Transvaal republic, which finally resulted in war. An outline of the events that led up to the war, and an account of military operations down to the close of the year, is given in the article on the *TRANSVAAL*. Here it will be possible only to include a brief discussion of the war measures and of the important expressions of opinion made in the course of parliamentary debates and in the press.

South African Crisis.—The negotiations between the British and the South African governments (see *TRANSVAAL*) reached a point in September at which the hope of a peaceful settlement became remote. On August 19, the Transvaal government, after practically conceding the British demands, offered the two counter-propositions that other differences should be referred to arbitration, and that Great Britain should give up its claim of suzerainty. These two proposals were rejected by the British government, and, in its despatch of September 8, the former demands were renewed, and in addition to them it was asked that the English as well as the Dutch language should be allowed in the deliberations of the *Volkraad*. The Transvaal then withdrew its concessions of August 19, and offered merely the seven-year franchise. The British retort was that discussion on this point was useless, and that the government would formulate its demands anew. This was on September 22, after which matters tended to a crisis. In the meanwhile both countries were making military preparations. The British army began to mobilize in September, and the Transvaal government added to its military forces on the frontier. On October 10 the Transvaal government sent in its ultimatum. Its effect was to unify the British political parties, and to convince many that war could no longer be honorably avoided. Then came the special session of Parliament (October 17-27)

for the purpose of empowering the government to call out the reserve. The attitude of the Liberals was defined in the speeches of the Earl of Kimberley in the House of Lords, and Sir H. Campbell-Bannerman, Sir William Vernon Harcourt, and Mr. John Morley in the House of Commons, while the Marquis of Salisbury, Mr. Chamberlain, and Mr. Balfour defended the course of the government. The position of the Liberals was that the action of the South African Republic in sending in its ultimatum had made war inevitable, and that they were ready to support the government in all measures that were necessary to vindicate its honor. At the same time they felt free to criticise the conduct of negotiations in which there were many points that did not meet their approval. They blamed the Colonial Office for what they characterized as the "methods of the new diplomacy." The publication of the despatches, particularly of the telegram of Sir Alfred Milner, which tended to inflame public opinion, was most unfortunate. There was an unnecessarily irritating tone in the demands of the government. This could not but lessen the chances of success. The government was accused of trying to intimidate the Transvaal by the sending of troops to the Cape, as well as to bully the latter power by the tone of its speeches and despatches. The Boer government was said to have offered practically all that was demanded, and there was no justification for the claim that it had shown an obstinate resistance. To go to war for the sake of the reduction of the franchise qualification from seven to five years was absurd. The right of suzerainty was abandoned in the convention of 1884.

On the other hand, it was argued, that the negotiations had been carried on in a friendly spirit; that the new diplomacy, as it was called, was necessary if a minister responsible for the negotiations were to ascertain the feelings of the people, and that the effect of the publication of despatches had been greatly exaggerated. It was said, too, that President Kruger's great ambition had always been to get rid of the word suzerainty, and that he had made up his mind to use the franchise question merely as a means to this end. It was not fair to blame the government for sending troops to Cape Colony; if the troops had not been sent the government would have been blamed still more. Mr. Chamberlain characterized the statement that he and Sir Alfred Milner had been determined on war from the first as a monstrous falsehood. He contended that the convention of 1884 gave the British government the right to interfere in the internal affairs of the South African Republic if British subjects were injured there, and that this right of interference was independently sanctioned by international law. He had hoped for peace and believed in peace from the first, but he insisted that British paramountcy, as he called it, must be maintained in South Africa. As to suzerainty, the word was of no importance, but the substance must remain. The independence of the Transvaal meant its independence as limited by the conventions. The franchise matter was in nowise the cause of the war. The empire was going to war in defence of the principle upon which it had been founded. It could not remain the chief power in South Africa unless it showed its ability to protect British subjects everywhere. The government had accepted every point in the Transvaal despatch except the demand that a pledge should be given that it would never again interfere. The Transvaal then withdrew its proposals.

The Irish members were wholly opposed to the war and blamed the government for its course all through. One of them moved to leave the differences between the two republics to arbitration in order that "an ignominious war may thus be avoided." Mr. Davitt declared that the Boers were wholly in the right and that the war was an act of criminal acquisition. As a protest against the government's course, he resigned his seat in Parliament. The purpose for which the special session had been called was accomplished by the passage of the Consolidated Fund act and the Treasury Bills act, to which reference has already been made. Space will not permit the summarizing of the discussion of the South African question with any fulness of detail, but to illustrate the opinions of intelligent Englishmen on each side of the question, the following extracts may be of value.
